

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

INDEX OF CONTENTS.

JULY TO DECEMBER, 1897.

A

ABURIA caffra, 294; ripens fruit in California, 266
Abies balsamea with globular exorescence below the soil, 298; *A. bracteata*, cones of, 298; *A. pectinata pendula*, 324
Acanthopanax sessiliflorum, 337
 Acreage of Hops, the, 164
 Africa, botanising in South-west, 338
Agaricus procerus, 385
Agave americana flowering at Englefield Green, 236
 Agricultural Returns of Great Britain, 164
 Airthrey Castle, Vines at, 360
Alberta magna, 416
 Aldabra Island, 321
 Aldenham House, Elstree, 266
 Algeria, the condition of, 385
 Allamandas, the culture of, 287
 Almonds, the constituents of, 263
 Almond-, Walnuts, and Chestnuts, the constituents of, 194
Amaryllis *Balladonna*, the Kew variety of, 212
 Amateur horticulturist, the, 434
 America, English Tomatoes in, 284; forest reservation in, 290; the Apple crop in, 398
 American Institute Show, 284
 American notes, 47, 122, 178, 284, 266, 342, 420
 Amsterdam Chrysanthemum club, 435
Ananas nervosa maxima, 418
 André Lenotre, 45
Angelonia grandiflora alba, 307
 Anthracite coal, 293
 Anthuriums, a group of, at Shipley Hall, 118; monstrosus, 298
 Antigua, the botanical station at, 379
 Antwerp Zoological Society, new winter garden at the, 109
Apera arundinacea, 282, 314
 Apiary, the, 5, 19, 51, 105, 161, 181, 251, 289, 327, 365, 415, 431
 Apple, Cox's Orange Pippin, a striped, 370; crop in America, the, 178; in the United States, 236, 398; Dameller's Seedling, 426; leaf, twin, 112; Peasgood's Nonsuch, 202
 Apple-trees, pruning, 448
 Apples, diseased, 112; some fine, from Yorkshire, 331; Yorkshire, 349, 404
 Apricot, the wild, and the graft, 139
 Apricots, Damsons, and Cherries a failure, 39
 Aquatic-pond, a hardy, 86
Aralias, acari on, 259
Araucaria imbricata associated with Golden-leaved Hollies, 256
Araucarias in Norway, 266
 Arboricultural Society, the English, 165
Aristolochia, a hybrid, 112, 126
 Artichoke, the Jerusalem, history of, 117
Asclepias curassavica, 414
 Asparagus-beds, digging alleys in, 437
 Asparagus-rust, 203
Asphodeline imperialis, 397
Aspidium Purdiei, 282
Aster Amellus, 214
 Aster, English and German, seed, 220; sickness, and its cause, 97; perennial "Ella," 286; worm, the, 97
 Asters, a garden of, 220; injured by worms, 129
 Auricula, the, 214; in autumn, 306

Auriculas, the growth of the stem of, 404, 422
 Australia, western, from a horticultural point of view, 137
 Autumn, the fine, 331, 386; tints, 312
 Autumn v. spring digging, 349
 Awards, the, of the Fruit Committee of the R. H. S., 402, 404
Azolla filiculoides, 56

B

BACTERIAL diseases, the treatment of, 156
 Bahamas, the, 205
 Baillie, proposed memorial to the late Mr., 366
 Bamboos, Japanese, 128
 Bananas, a fine bunch of, 166
 Bardfield Oxlip, the true, 355
 Basset Down House, 302
 Bateman, the late Jas., 410, 436, 446
 Bats fertilising flowers, 22
 Birds useful to gardeners, 229
 Bean, Bunyard's Exhibition, 111
 Bedding in Battersea Park, 123; in Hyde Park, 101
 Beet-sugar industry, the, 417
Begonia, a crested, 203, 220; fuchsioidea, 437; Mrs. W. B. Hartland, 366; Gloire de Lorraine, 384; President Carnot, 212
Begonias, 212
 Belgium, notes from, 254; special exhibition of *Cattleya labiata* in, 350
Belladonna Lily, the Kew variety of, 212
 Belvoir, autumn flowers at, 305
 Benefit and Provident Society, United Horticultural (Annual Dinner), 278
 Benevolent Institution, Gardeners' Royal, 54
Berberis, propagating by cuttings, 226
Berberis vulgaris and mildew, 184
 Berlin, Chrysanthemums in, 413
 Berlin, *Primula sinensis fimbriata* at, 413
 Bermuda Lily disease, 368
 Betteshanger, 286
 Billington, Horace, the late, 421
 Blackberry, the Kittatiny, 129
 Blackberries, 147, 186, 219
 Black Currants, 330
 Boilers, experiences with horticultural, 238

BOOKS, NOTICES OF: A Companion for the Queensland student of Plant Life (*F. M. Bailey*), 157; Botanical Magazine, 87, 89, 184, 271, 348, 416; Bulletin of the Essex Technical Laboratories, 182; Catalogue of plants at La Mortola, 272; Culture des Fleurs par les Enfants et par les Ouvriers (*C. de Boscquere*), 38; De Re Hortensi Libellus (1545) (*Carulus Stephanus*), 425; Des Jacintes, de leur Anatomie, Reproduction et Culture (*Marquis M. H. de Saint Simon*), 377; Dictionnaire Iconographique des Orchidées, 322; Die botanische Institute der freien und Hansestadt Hamburg's (*Dr. A. Voigt*), 194; "Die Muskatnuss" The Nutmeg, &c. (*Dr. O. Warburg*), 1; First Report of the Woburn Experimental Fruit Farm (*Duke of Bedford and S. N. Pickering*), 33; Flora Glimpses into Plant Life (*Mrs. Brightwen*), 368; Hand-list of Monocotyledons grown under Glass at

Kew, exclusive of Orchids, 72; Hardy Perennials and Old-fashioned Garden Flowers (*Jno. Wood*), 382; Hooker's Icones Plantarum, 8; How to Grow Begonias (*G. A. Farini*), 17; Illustrated Flora of the Northern United States, Canada, &c., 2nd ed., 72; Journal of the Royal Horticultural Society, 162, 182; Kew Bulletin, 164, 402; Laboratory practice for Beginners in Botany (*W. H. Setchell*), 402; Lawns and Gardens (*N. Jonsen-Rose*), 120; Lindenia, the English edition of, to be discontinued, 322; Maladies des Plantes Agricoles, (*Ed. Prillieux*), 164; Manuel des Cultures Speciales *Dr. Paul de Vuyt*, 358; Manuscripts of Gilbert White, 366; Memorials, Journal, and Botanical Correspondence of Chas. Cardale Babington, 329, 393; Modern Chrysanthemum Culture for the Million, 417; Open-air Studies in Botany (*R. Lloyd Praeger*), 319; Orchidacearum Genera et Species (*F. Kränchin*), 126, 322; Pasture and Pasture Plants (*W. Toogood*), 403; Paying Pleasures of Country Life, 90; Principles of Fruit-culture (*E. S. Goff*), 432; Pot-Pourri from a Surrey Garden (*Mrs. C. W. Earle*), 111; Publications Received, 39, 72, 165, 184, 203, 219, 236, 274, 293, 368, 418, 436, 447; Report of the Horticultural Section of the Technical Education Committee of the Surrey County Council, 402; Synoptical Flora of North America, 38; The A B C of Rose Culture (*Ed. Mawley*), 72; The Amateur's Flower Garden (*Shirley Hibberd*), new ed., 368; The Average Contribution of each of Several Ancestors to the Total Heritage of the Offspring (*Francis Galton*), 216; The Commercial uses of Coal-gas, 417; The Fern Bulletin, 329; The Flora of British India, 416; The New Flora Britannica (in the Lindley Library), 366, 405, 417; The Potamogetons of the British Isles (*Alf. Fryer*), 292; The Principles of Fruit Growing (*L. H. Bailey*), 268; The Record of the Royal Society, 164; The Scots Gardener, 301; The Useful Fibre Plants of the World, 314; The Water Garden (*W. Tricker*), 366; The Yew Trees of Great Britain and Ireland (*Jno. Lowe, M.D.*), 252; Year Book of the United States Department of Agriculture, 254

Bordeaux Mixture and the Potato disease, 294, 313
 Border, a Vine tester, 313
 Borders, to test Vine, 349
 Botanical exploration in Yunnan, 231
 Botanical garden, Old Calabar, 243
 Botany of South-west Africa, 338
Bougainvillea glabra, 274
Bougainvillea, bright-coloured, in cool temperature, 238
 Bramble, the Paraleys-leaved, 166
 Brassicas, notes on the cultivated, 195
 British Association, 148, 166
 British Guiana, the botanical stations in, 304
 British woodland, types of, 85, 267, 428
 Brownip, the, of plants (disease), 219
 Brown-rot in Turnips and Cabbages, 437
 Brussels Exhibition, the, 286

Buckingham Palace, decorations at, 6
 Buckwheat, analysis of, 402
 Bulb and Potato box, the Jersey, 422, 448
 Burdock as a vegetable, 101
 Burford, Dorking, notes from, 75
 Buxus, the propagation of, 286

C

CABBAGES, brown-rot in, 437; weights of large red, 436
 Cactus, a large-fruited, 185
 Caen, 193
 Calathea species, 293
Calceolaria alba, 140; *C. peloriana*, 112; *C.*, the herbaceous, 340
Calceolarias, 182
 Calcutta Botanic Garden, 124
 Californian Oranges, 236
 Calochortuses, 22
 Camellias, the culture of, 74
Campanula maxima, 22, 274
Campanula Balchiniana x, 17; *C. mirabilis*, 307
Camposema pinnatum, 32
 Canada in Covent Garden, 339
 Cape fruit cultivators, 184
 Cape, importation of plants to the, 21
 Cardiff public gardens, 282
 Carnation, a new, 129
 Carnation clip, a, 77
 Carnation leaves, malformed, 334
 Carnation Society, the Southern Counties, 202, 220
 Carnation, Souvenir de la Malmaison, the cultivation of, 394; the large blush-flowered, 3
 Carnations at Hamburg, 109
 Carnations, new varieties of, 174
 Carnivorous slugs, 314, 348, 386, 437
 Carpet bedding, Jubilee, 274
 Carriers of commerce, 87
 Carrot in India, the, 205
 Carrot-pudding, a sweet-savour, 18
Castanopsis chrysophylla, 411
 Catalogues, Continental and British, 385
 Cattle show, side exhibits at Islington, 418
Cattleya, chemical composition of a, 57; *C. Dowiana aurea*, 812; *C. Empress Frederick* var. *Leonata*, 428; *C. labiata* special exhibition of, in Brussels, 350; *C. L.*, sport of, 370; *C. Mendeli*, an irregular, 45; *C. Mossie*, var. *Rappartiana*, 17; *C. Schilleriana*, 31; *C. Schofieldiana gigantea*, 246, 274; *C. Warsowiczii*, 162; *C. W. gigantea*, 81
Cattleyas, sub-pelorian, 334; two fine, 282
 Cauliflower, early, 23; Veitch's Extra Early forcing, 219, 287
 Cauliflowers and Broccoli, 378
 Cauliflowers forming heads a second time, 237
 Cedrela toona, fasciated, 298
 Celeriac, when first used, 23
 Celosias as bedding-out plants, 148
Cenchrus tribuloides and *C. echinatus*, 86
 Cereals, cross-breeding in, 446
 Ceropogon Woodi, 357
 Ceylon Botanic Gardens, 32, 380
 Chaouasia Alpine Garden, the, 54
 Cherries, articles of food, 263; French, 48; the chemical composition of, 174
 Cherry-crop, the, 89

Cherry-Plum, the, 128
 Chertsey Lock, girth of a Willow at, 289
 Chestnuts, the constituents of, 263
 Chestnuts, Walnuts, and Almonds, the constituents of, 194
 Children's Gardening, 70
 Chiswick, early autumn Chrysanthemums at, 247
 Chiswick, luncheon and meeting at, 38; meeting and lecture at, 52
 Chrysanthemum, Afané, 417; a Belgian competition, 435; club, Amsterdam, 435; culture, 446; evolution of the big, 436; fungus, 294; gossip, 302, 331, 340, 357; herbaceous, var. Ray Lankester, 72; leaves diseased, 220; Mrs. Chas. Birch, 406; Mrs. R. Jones, 382; Pennsylvania, 384; plants, specimen, 404; proliferous, 406; show, the, 346; shows, private, 369; sports, 432; W. H. Lincoln, 428
 Chrysanthemums, 207; at Berlin, 413; attacked by fungi, 256; by grubs, 132; at Stuttgart, 429; disqualified, 202; early-flowering, at Chiswick, 247; early-flowering, 272; in November, out-of-doors, 394; in the Victorian Era, 14; leading exhibition varieties of the year, 428; notes on new, 419; seasonable notes on, 443
 Cirrhopetalum Colleti, 46
 Cistus, species and hybrids of, at Edge Hall, 32
 Clerodendron fallax, 325
 Clifton Zoological Gardens, Bristol, the, 255
 Clip for fruit trees, a leaden, 77
 Clouds, the height of, 203
 Coal, anthracite, 298
 Coal, the first discovery of, 445
 Cochlioda stricta, 410
 Cocker, the late Mr. J., 221
 Codiaums, the propagation of, 47
 Codlin-moth, the, 203
 Codonopsis ovata, 195
 Cœlogyne Micholitzii, 18
 Colonial notes, 22, 32, 73, 124, 205, 303, 342, 363, 379
 Comparettia macroplectron, 425
 Conifers of the Santa Lucia Mountains, the, 280
 Conifers, rare, 165
 Conifer seeds, the germination of, 434
 Constantia vineyards, 32
 Continental novelties, 307, 333, 363, 426
 Co-operative Festival, the, 146
 Copper plant, the, 406, 417
 Copper preparation for spraying, 117
 Coryanthes leucocorys, 31
 Coryanthes, the, 30
 Cost of ground-work, 370
 Cotoneaster pannosa, 412
 Cotoneasters, propagating, by cuttings, 227
 Covent Garden, Canada in, 339
 Cranberry picking in Wisconsin, 180
 Crataegus, propagating, by cuttings, 226
 Crinum Balfouri, 212; C. Powellii x, 306
 Crops, acreage of, in the United Kingdom, 385
 Cross-bills, 111
 Cross-fertilisation of plants, 113, 163
 Cucumber, Frogmore All-the-Year Round, 369
 Cucumber with adherent leaf, 57
 Cultivation, the requirements of plants under, 292
 Cuphea miniata compacta, 333
 Cupressus macrocarpa, 52; C. m. lutea, 428
 Cycas revoluta, 411
 Cyclamens, lecture on, 222
 Cyenoches chlorochilon, a monœcious, 121
 Cymbidium Lowianum viride, 46; C. Traceyanum, 312
 Cyprins, the Monterey, 52
 Cypridium x, 81; C. Beekmanni, the sale of, 434; see also correction at p. 446; C. Curtisii, 46; C. Dauthieri, 441; C. Godefroya, 412

Cypripedium, monstrous, 406; two-lipped, 112
 Cypripediums in cool houses, 433
 Cyrtanthus spiralis, 303
 Cytisus, the propagation of, 286

D

DACRYODES hexandra, 86
 Dahlia, a two-faced, 255; early-flowering Cactus, 91; D. Flambeau as a bedder, 220; alleged hybrid, 406; D. Keynes' White in Germany, 312; roots, preserving in winter, 275; the lost, 441; the Pompon, origin of, 55
 Dahlias at Slough, 232; at the National Dahlia Society's show, 443
 Darwin statue at Shrewsbury, the, 106, 122
 Date Plum of Japan, the, 441
 Delany's, Mrs., paper mosaics, 36
 Dell, The, Egham, Orchids at, 361
 Dendrobates, spots in, 74
 Delphinium speciosum var. glabratum, 307
 Dendrobium barbatum, 394; D. coeleste, 1; D. cœlogyne, 386
 Dendrobium flowers, malformed, 18; McCarthies, 46; Orchid-beetle, the, 48; Victoria Regina, 121
 Deutzia corymbiflora, 363; D. Lemolnei compacta, 363
 Diazenes Dendrobii, 48
 Diervilla Middendorffiana, 363; D. sessilifolia, 17
 Digging, autumn v. winter, 328, 349, 421
 Dipteracanthus subringens, 86
 Disanthus œroidifolia, 426
 Diseased Melons, 298
 Diseases, fungoid, the prevention of, 81
 Diseases of plants, the, 61, 81, 91, 97, 117, 140, 156
 Dombeya, a hybrid, 417
 Dominica, the botanic station at, 363
 Dover House Gardens, Roehampton, notes from, 72
 Dracæna Warreni, 272
 Dundee jam trade, the, 236

E

EARTHQUAKES, the effects of, on trees, 385
 Earwigs, 220, 238
 Earwigs and Peaches, 256
 Echinocystis lobata, 270
 Echinops albidus, 154
 Eden Hall and Garden, 390
 Edinburgh School of Rural Economy, 90
 Eleagnus macrophylla, 426
 Empirical knowledge, the value of, in the culture of plants, 270
 Enchytræis parvulus (Aster-worm), 97
 Engineers and surveyors as gardeners, 165
 Epidendrum x radico-vitellinum, 16; E. Stanhopeanum, 29
 Epilælia x radico-purpurata, 61
 Eriopsis Helenæ, 98
 Erythea edulis at Santa Barbara, 157
 Escallonia Langleyensis x, 17
 Escallonia, the propagation of, 286
 Eucomis punctata, 214
 Eucryphia cordifolia, 246
 Eulophia Wendlandiana, 262
 Examination in horticulture, results of the R. H. S., 38
 Examinations in horticulture, 88
 Eyes, propagation from, 138

F

FALCO tinnunculus (the Kestrel), 207
 Fasciated Cedrela, 298
 Feeding of plants, the, 284
 Ferments in germination, the rôle of the soluble, 420
 Fern, an extraordinary hybrid (?), 179; peculiarities of a hybrid, 447

Ferns of the Victorian Era, 13
 Ferns, rock and sun-loving, 272
 Fertilisation of Zamia and Ginkgo, 402
 Fertilisers and Feeding Stuffs Act, 1893, 90
 Fertilising flowers, bats, 22
 Fibre, the Ramie, 333
 Ficus, the creeping species of, 205; radicans variegata, 185
 Fig culture, Parisian, 153
 Figs, Brown Turkey and others, 238
 Finlay, J., the late, 56
 Fir, a noble Scots, 55; the weeping Silver, 324; woods, planting and thinning Spruce, 360
 Firing Strawberry-plants, 40
 Flagstaff, the, at Kew, 21
 Floral leaves, the use of, 330
 Florist, the special meaning of the word, 434
 Florists flowers, 3, 207, 214, 306, 340, 394, 428, 443; the cross-fertilisation of, 113
 Flower-beds in Riviera gardens, 82
 Flower-garden, the, 5, 18, 35, 50, 79, 86, 105, 125, 142, 161, 180, 199, 214, 233, 251, 268, 289, 308, 327, 344, 365, 382, 399, 414, 431, 445
 Flower-tube for the preservation of flowers in the button-hole, a, 151
 Flowers, representations of, in coloured paper, 36
 Flowers, unseasonable, 345, 434
 Flückiger Medal, the, awarded to Mr. E. M. Holmes, 272
 Fog, the exclusion of, from hothouses, 47, 75
 Forcing, hardy plants for, 428
 Forde Abbey, Chard, 322
 Forest reservation in America, 290
 Forestry, 85, 179, 267, 287, 322, 360, 398, 428
 Forestry School at Nancy, the, 287
 Forsythias, the propagation of, 285
 French Cherries, 48
 French garden, a, in 1545, 425
 Frost, early, 186
 Frost in July, 40, 56, 74, 90
 Fruit, at the Hamburg Exhibition, 254; conservation in America, 179; crops in Essex, 186; crops of Greece, the, 250; crop, the faulty, 148; crops, report on the condition of the, 63, 70; crops, remarks upon the, 82, 100, 121, 141, 158, 176
 Fruit culture, 111; in Her Majesty's reign, 258
 Fruit failure, the, 128
 Fruit, foreign importations of, 71; from the Cape, 202; judging, 404; show at the Crystal Palace, the, 234, 241; the storing and preserving of, 10
 Fruits and vegetables, the consumption of, in Manchester, 54
 Fruits, bush, the propagation of, 177; of the last sixty years, likely to prove permanent additions, list of, 258; in the United States, 227; of the Victorian Era, 40; the preservation of, by alcoholic vapour, 444; tropical, 204; growth of, in Madeira, 123
 Fruits under glass, 4, 18, 35, 50, 62, 87, 104, 125, 142, 161, 180, 199, 215, 233, 251, 268, 288, 309, 326, 345, 364, 383, 399, 415, 431, 445
 Fruit trees, on outside walls, 256; a lead clip for, 77; feeding mulches for, 102; planting, 261
 Fuchsias, some new, 295
 Fuel supply of the earth, the, 149
 Fungus on Chrysanthemums, 256

G

GALL on Jessamine, 370, 406
 Galls on Oak roots, 298, 334
 Garcinia mangostana (Mangosteen), 324
 Gardeners' Company, the, 21
 Gardeners' supplanters, 330, 349
 Gate-side, Drymen, 427

Gatton Park, Surrey, 342
 Gerbera Jamesoni, 138
 Germination, the, of Conifer seeds, 434
 Germination, the rôle of the soluble ferments in, 420
 Ghent, notes from, 312; the coming show, 347
 Gladiolus primulinus, 212
 Glasgow, a new public park for, 21
 Gleichenias, 252
 Gloxinia bloom, a striped, 218
 Gloxinias, bicolor, 128
 Godeia Butterfly, 314
 Gooseberry, the spineless, 184, 203
 Gooseberries, heavy, 147
 Grammatophyllum speciosum, 146
 Grape, the outdoor crop, in Wales, 274; Gros Guillaume, heavy bunches of, 384; judging, 314; juices as ink, 253; Muscat of Alexandria sporting, 437; the Chiswick Muscat, 348; Lady Hutt, 202; Voss's Black Muscat, 274; shrivelling of, 313; Vines at Norwood, Alton, 306

NUTMEGS.*

THE author of this book begins by saying how interesting he found the study of the Nutmeg-tree, both true and false, during a period of eight years spent in the Eastern parts of the Malay Archipelago and in New Guinea. There these trees enjoy a climate exactly suited to them, and there, in consequence, is situated the centre of their distribution. There also they take the same relation to botany that Birds of Paradise do to zoology.

The claim of the Nutmeg for consideration as an article of commerce is connected with a series of romantic stories of its discovery in times long past, of the fierce war that raged among European countries for their commercial rights, of the combat for monopoly that ended in the extermination of the natives, and the break-up of the greatest merchant-company that has ever existed. All this eventful history is interwoven with the stillness of every grove of Nutmeg-trees, and with the grand scenery of every inland lake.

With such words as these, the author commences a work which is, in its way, unique. He proceeds to treat of the history of the Nutmeg previous to the discovery of the Banda Isles, of the use that has been made of it in poetry, and of the philological history of the various names for Nutmeg and Mace.

The second part of the book is devoted to the cultivation of these spices, and includes a large amount of cultural detail and history. We are told of the strenuous endeavours made by the Dutch East India Company to preserve the monopoly, and how finally they were forced to relinquish it; and the author further reminds us of the exertions that were made with more or less success to induce the Nutmeg-tree to flourish and become naturalised in other localities. Dr. Warburg notes that at Syon House, Middlesex, very large fruits have been brought to perfection. It would be interesting to learn whether this tree is still flourishing. [No, it was removed some years since. ED.] In an appendix to this section of the book is a tabular epitome of the cultivation of Nutmegs and Mace from the years 1634 to 1894—that is, during a period of 260 years.

The third and botanical division of the book deals with the Nutmeg-tree itself, and numerous other species that merit attention from a commercial point of view.

The fourth division is concerned with the cultivation, the fifth with the trade details. Not only the species recognised in commerce, but

the false Nutmegs, and the substitutes for the genuine spice are fully considered. In an appendix to this section of the book are given detailed price-lists of Nutmegs and Mace.

The sixth section deals with the collateral products of the Nutmeg-tree, their commerce, and history. Among them are oil of Nutmeg, oil of Mace, candied Nutmeg fruits, candied Mace, and Nutmeg fruits in vinegar or salt.

In the seventh division the medicinal and aromatic products of the Nutmeg-tree are considered, and the poisonous qualities of the Nutmeg receive due notice.

In the eighth section the author considers the future prospects of Nutmeg cultivation.

Finally, there is a complete literary catalogue of some eighteen pages, which speaks well for the thorough acquaintance of the author with his subject. A very complete index greatly adds to the value of the book.

We congratulate Dr. Warburg on the completion of this work, which will serve as a model for all future books of the kind, no such complete monograph having before appeared. Everybody, be he botanist or gardener, chemist or philologist, historian, political economist, or merchant, will here find a wealth of information, whilst the general reader will find it a most interesting and instructive work to add to his library shelves.

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM CEELESTE, n. sp., Lohr.*

The habit much resembles that of *Dendrobium Victoriae* Regins (ante, p. 399, vol. xxi.), although from quite another locality, many hundred miles distant. The two species are never found growing together. Its habitat is about 2500 m. elevation (8125 feet), amongst quite European vegetation. Oaks, Rhododendrons, Azaleas, and Myrtles, are its only companions. No typical plants remind the wanderer that he is in a tropical country. This *Dendrobium* seems to be extremely rare.

The fleshy flowers are entirely dark blue, with the exception of the ovary and spur, which are purple. The sepals and petals are ovate, and almost equal in size, the lip obovate and blunt, the column blue. *A. Lohr, Manila.*

PLANTS OF THE VICTORIAN ERA.

VEGETABLES, 1837—1897.

(Concluded from p. 416, vol. xxi.)

CARROTS.—During the sixty years' reign we have seen some admirable additions made to our Carrot stocks. The little and early French Horn, Long Orange, Long Surrey, and Altrincham, are very old varieties. But we grow now not only a better stock of the French Horn, but in the Early Nantes and Early Carentan, both of the blunt-rooted type, we have valuable summer Carrots, that are universally grown; and the intermediate section, of which the finest now is St. Valery and its English selections, have become by far the most popular for main crop or general use. These stouter, tapering, handsome Carrots have largely elbowed out the long ones of earlier years. As to culture, that remains very much the same.

CELERY.

Generally, the culture of Celery remains where it was, for we grow it in trenches,

as of old, and even the practice of blanching with paper bands, to secure extra fine stems for exhibition, is by no means new. In the early years the Violet, new Flat-stemmed White, Manchester Red, White, and a few others, were the best known. The Manchester Red is still favoured in Lancashire, but the others have been displaced. Beyond adding the Turnip-rooted Celeriacs—a valuable product—we have in the incomparable Dwarf White forms, the dwarf reds, such as Standard Bearer and Colonel Clarke's red, as well as the solid whites of various appellations, Celeries so good that they seem as if improvement on them was impossible.

CUCUMBERS.

In 1837 it was common practice to grow Ridge Cucumbers in gardens and fields, whilst of the few good house varieties that existed, Cuthill's Black Spine being one of the best remembered, all culture was in frames or pits, and poor indeed compared with what is to-day seen in houses expressly built for Cucumber growing. This has become a very important industry, as the supply of home-raised fruits under glass put into the market, and exceptionally good fruits, too, is enormous. One market establishment alone has over 100 houses each 160 feet long devoted entirely to Cucumber production. This is to us to-day a common-place fact. It was undreamt of by our fathers sixty years ago. Our Telegraphs, Perfections, Progress, Rochford's, and many other Cucumbers, testify excellence in length, quality, and productiveness, and long will it be ere they are excelled. Before, we grew the plants on big heaps of soil. Now, in houses, we grow them really in as little root-space as possible, and in return they are all the more productive.

LETTUCES.

Beyond materially increasing our varieties, we have little that is new to say about the others. In the thirties there were the Paris White and Green, and also the Bath brown Cos forms. They are of our best still, and these were of Cabbage form; the Malta, Neapolitan, &c., and both are good varieties to-day. There have been numerous additions to the Cabbage type, of which All the Year Round, Leyden's White Dutch, Model, and some others are good; but all the same, varieties have not been quite so plentiful as names.

ONIONS.

Very considerable is the advance made in Onions. The varieties Silverskin, Deptford, James' Keeping, and the underground or Potato variety, are very old. Now we have a score of the Spanish type, flat, round, and oval, the finest of which, Ailsa Craig, Lord Keeper, Sutton's A 1, Cranston's Excelsior, and many others, have, on the exhibition table, obtained high honours; whilst there are in Main Crop, Southport Red, Reading, &c., some capital main-crop varieties; and of softer Onions, Italian and Tripoli, there are many very fine forms. The very precocious "Queen" has proved to be a useful addition to our stocks. Whilst we grow Onions from autumn and spring sowings pretty much as our fathers did, the newer method of raising the plants under glass in mid-winter, and planting out thinly on to rich soil to secure specially fine bulbs, is largely adopted, with remarkable results.

Shallots.—The small, true Shallot is still better than the coarse Large Red or Jersey.

* "Die Muskatnuss:" the Nutmeg, its history, botany, cultivation, trade and value, also its imitations and surrogate. With a treatise on the cultural history of the Banda Isles. By Dr. O. Warburg. With three heliogravures, four lithographic plates, one map, and twelve illustrations in the text. (Leipzig, Engelmann, 1897, 8vo, xii., and 628 pages. Price 20 marks.)

* *Dendrobium celeste*, n. sp., Lohr.—Præcedenti habitus simile, sed coribus fere, 2—3-pla minoribus, omnino pulchre violaceis, germinibus calcaribus purpureis. Sepala et petala subaequalia, ovata, labellum e basi angustata obovatum, obtusum, basi margine inflexum; columna brevis violacea, anthera apice rotundata. Ins. Philip.

PEAS.

As to Peas, which form our chief summer vegetable, we had in 1837 numerous varieties rather hardy and precocious, with but two or three real marrows, yet were these two or three of singular value, as from Knight's Dwarf and Tall Marrows doubtless have come the myriads of marrow or wrinkled Peas, of which we now have apparently hundreds. The most noted of the hard rounds were Early Charlton, Double Blossom Frame, Blue Prussian, Auvergne, Groom's Blue, Woodford Green, Cimeter or Scimeter, and several others. How have these disappeared from commerce, and no wonder, considering how many other varieties have been raised since 1837! Even the once-popular Sangster's No. 1 and its allies, so early and so hardy, are disappearing even from market culture. Then we had British Queen, Champion of England, Paradise Marrow, Hair's Mammoth, but these are giving place to Eclipse, Telegraph, Duke of Albany, &c., or of dwarf forms, William Hurst, Daisy, and many others. Gradually the old hard round Pea is being eliminated from culture, and in gardens, especially wrinkled marrows of great precocity and excellence, as well as dwarfers, are taking their places. So far as flavour generally is concerned, we have gained little, as the old Ne Plus Ultra and Champion of England, so long in cultivation, still remain the best for quality, but in size of pod and in productiveness the progress has been remarkable. Our best Peas to-day—and they are legion—seem to be unsurpassable, but still raisers keep on striving to excel what seems to be so perfect.

POTATOS.

Finally, the Potato comes under notice, and it alone might command columns of matter to render it full justice. Our fathers in 1837 had relatively few varieties to grow, the best known being Early Manly, Early Shaw, Picotee-eyed Scotch or Regent, the true Ashleaf Kidney (still with us), Red-nosed or Lancashire Kidney, and the Walnut-leaf Champion (not the later-known Scotch Champion), Bread-fruit, Jersey Rebel, Lapstone, and Forty Fold. How few of these remain now! But for the incursion of the terrible *Phytophthora infestans* in 1845—memorable year of disaster to the Potato—most of them might have been in commerce to-day. But that disease, succeeded as it was for many years onward, though not always, with such deadly results, almost decimated Potatoes, but aroused growers to the need for other, stronger, and better resisting varieties. These in time came, and for them we have to thank the American raisers very much, as the intercrossing of these varieties with our own best, led to the production ultimately of such strains, that even when the disease does considerable harm to the Potato-plant, yet the production of tubers is, on the whole, enormous. To obtain these comparative disease-resisters, we have had to sacrifice something of the delicious flavour and quality which marked the Regent, Victoria, and others; but higher quality is now returning, and indeed it seems to be the chief requirement in Potatoes to-day. Now, not a year passes without hundreds of varieties of Potatoes are at our disposal. With regard to precocity, we perhaps have gained little, for the old Ashleaf is still one of the earliest; but we have gained immensely in productiveness and in resistance to disease. It is because of the latter fact, no doubt, that growers have to a general extent refrained from utilising the now famous Bordeaux or anti-disease mixture; but it is satisfactory to know that it is a

cheap and potent force for good, if we will but utilise it. The Potato is now probably, next to Wheat, our most important food product, and there is no evidence of decadence. It is far more probable that as the years roll on this admirable esculent will be even more widely grown and more largely consumed.

SEAKALE.

With respect to this useful winter vegetable, we have added in Lily White one variety to the old purple-stemmed form, and yet the latter is still the one generally cultivated; but there has been great advance made in culture, as the old plan of treating the plant as an ordinary perennial is fast dying out, and the better practice of increasing roots every year by means of root-cuttings mostly prevails. By those means a plentiful stock of good, even-sized crowns for forcing or blanching may be had all through the winter.

PARSNIPS

were in '37 represented by the good Hollow Crown; that is still the best variety, although it has undergone since then some careful selection, and a few others have been added to our lists, of which the Student is, perhaps, the best liked.

RADISHES,

too, have greatly advanced, and the very early olive-shaped forms, and especially those pretty ones known as Breakfast Radishes, have very greatly displaced the old, long-rooted ones; whilst we can have nice roots from the earliest varieties fully two weeks sooner than the older varieties furnished. With these, however, nothing new in general culture is found.

SPINACH.

We have in the French varieties of Viroflay, and in Carter's Longstander, far finer Spinaches, and more prolific of leaves, than the old Flanders, long as these latter have been in cultivation.

TOMATOS.

When the Queen came to the throne, this vegetable—fruit, if such it may be termed, was known almost exclusively as the "Love Apple," and, but one variety, the old Corrugated Red, was grown. The culture was usually against warm walls, and somewhat rough, the side shoots being nailed in and not pinched out as now. For many years Tomato culture was stagnant, the great merits of the fruit product not being recognised. Now all is changed, but glasshouses have done most to bring about this change. Varieties have increased by scores, and literally towns of glass-houses are devoted to their culture. In no direction, probably, has there been seen such marvellous development in any one product as the Tomato presents. It is a vegetable that will in gardening or in market industry be more signally identified with the Queen's long reign than any other. Varieties now seem to be in every respect perfect. So, too, is culture, but as to extent, that cannot have been reached. Really, culture and consumption may be regarded as illimitable.

TURNIPS

were in the thirties represented by somewhat coarser stocks of White Dutch and the yellow variety. Now, what with the very early Milan (which will supply nice bulbs from frequent sowings all the summer), the pretty white Snowball, Golden Ball, with its soft yellow flesh, and the Red-top Globe, our stocks are far superior. Still, we can grow them only as Turnips were grown sixty years since.

HARDY TREES AND SHRUBS.

(Concluded from p. 418, vol. xxi.)

OLEARIA HAASII.—A singular member of the extensive Composite family has been added to dwarf-growing evergreen shrubs within the last ten years, and flowering as it does in early summer, with masses of white, strongly-scented flowers, it is a great gain.

A still newer evergreen plant, blooming in June, and having green, persistent leaves, like a small Holly, is the *Osmanthus*, from Japan, which has many variegated and other forms. And that reminds me I omitted to mention *Paulownia imperialis*, that noble-leaved tree, producing in sheltered spots large lilac, Gloxinia-shaped, sweet-scented flowers. It was introduced to our gardens in 1840.

Rhus glabra laciniata, an elegant Fern-leaved Sumach, is also an acquisition of late years; while the *Robinia*, so esteemed on the Continent, has been there greatly improved, and we have now a great many distinct and fine sorts, as *R. Bessoniana*, *Decaisneana*, *sempiflorens*, &c., all of which may be claimed as gains to horticulture during our Queen's long reign.

The Japanese *Rosa rugosa*, when planted upon a bank or the front of a shrubbery, what can surpass these in beauty of foliage, in the graceful elegance of their large single flowers, and lastly their handsome hips, which in Japan, and here also, are made into a much-esteemed conserve.

Nor must we forget the Japan *Skimmia*, with its fragrant foliage and flowers, followed in a few favoured localities with its bright red berries, introduced by Thunberg from Japan in 1840, and since improved by Standish and others. (See article on *Skimmias*, in the *Gardeners' Chronicle*, vol. xxv., 1886, p. 245.)

Nearly, if not all, the shrubby *Spiræas* have been acquired in the Victorian reign, including *Exocorda grandiflora*, *Nobleana*, *Douglasii*, and lately *Bumalda ruberrima*; while from Japan we have the elegant *Spiræa palmata*, and the useful *Astilbes* as herbaceous perennials.

Among hardy shrubs, the Lilac is an acknowledged favourite, and by the introduction of *Syringa Emodi* from the Himalayas in 1845 we now have upwards of a hundred garden varieties, great improvements in size and colour of flower; while that industrious and very successful hybridist, M. Victor Lemoine, has lately introduced some fine double-flowering kinds. Lastly, we have in *Veronicas*, *Traversi*, *Hulkeana*, and *Andersoni*, and in *Viburnum plicatum*, three very distinct and useful sub-shrubs; which must end this long catalogue of useful and ornamental acquisitions during Queen Victoria's reign. *Experience*.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT Highbury, SHEFFIELD.

Highbury, the residence of Mr. Duncan Gilmour, is situated to the north-east of the city of Sheffield; it is high up in the hills—1100 feet above sea-level—near to some extensive moorlands. The Orchids are in first-class condition, quite a pleasure to inspect. The houses, which extend for more than a quarter of a mile, and face due south, are mostly span-roof structures, with a pathway down the centre.

Odontoglossum crispum is represented by some 12,000 plants, in a very unpretentious-looking structure. Included in this number are 6,000 imported plants, commencing to grow vigorously. Some

experts prefer heart-shaped bulbs, as being likely to produce the best varieties, and elongated ones are rejected, but Mr. Gilmour's experience is, that a good variety is as likely to be produced from one shape as another. There was a quantity of plants of *Odontoglossum citrosimum*; amongst them I noticed the pale variety *O. c. roseum*, and another with large

deepest crimson, with lips from pale lemon to the richest orange, and beautifully fringed; there are no fewer than 2000 of these in the place. Amongst the best of them were *C. M. Reineckiana*; its flowers are perfect in shape, with broad petals, and a broad spreading lip, beautifully fringed; the throat golden, streaked with a shade of purple, the colour of

aurea hanging from the roof, and I was told that there were 300 on the place. Of *Miltonia Roezli* there was a very fine batch in flower, then slightly on the wane, the plants having been in flower for nearly a month past. *Cattleya Trianaei* is a species that is largely grown, and Mr. Gilmour pointed out a fine plant of *C. T. Schroderae alba*, which he believes to be the finest form of it in cultivation. There are *Dendrobiums Wardianum* by the hundreds, which grow larger year by year. I passed a vigorous lot of *Odontoglossum grande*, as well as *Oncidium varicosum Rogersii*, and a good collection of varieties of *Dendrobium nobile*, &c. *W. Harrow.*

LUDEMANNIA LEHMANNI.

A stout pendulous, dense raceme of this pretty and rare species is sent by Joseph Broome, Esq., Sunny Hill, Llandudno. The inflorescence bears over fifty flowers, each 2 inches across, and of fleshy texture. The sepals are yellow, tinged with purplish-red; the narrower petals light orange, with a few reddish spots on the basal halves, and the lip orange, with a dark purple base. The flowers are strongly aromatic, and the plant, with its heavy raceme proceeding from the bottom of the basket, must have been a striking object. A fine variety of *Cypripedium caudatum Wallisii*, a very distinct *Cattleya Mossiae*, with an almost wholly orange-coloured lip; and flowers of *Laelia purpurata Brysiana*, *L. p. alba*, and *L. p. Russelliana*, all excellent examples, are also included. *J. A.*

SPIRÆA ARGUTA ×, Zabel.

THE earliest of the flowering trees and shrubs were this year fortunate in having warm and moist weather, but no spring in recent years was more unfavourable to the flowering of those that followed them. Among other plants, the *Spiræas* suffered badly. Frosts by night, and dry cold winds by day, prevented several of the most beautiful varieties, such as *S. Van Houttei* and *S. media*, from opening their flowers. It says much, therefore, for the hardiness of *S. arguta* that it has never been better than during its last flowering season. And when to that great merit is added its undoubted superiority to all other early *Spiræas* in beauty, it is clearly one that deserves to be brought into general notice. It is as yet rare and but little known, being of hybrid and comparatively recent origin. The first mention of it occurs, I believe, in the *Berlin Garten Zeitung* for 1884, p. 494. Its parentage is there given by Zabel as *S. media* × *S. multiflora* f, *multiflora* itself being a cross between *S. crenata* and *S. hypericifolia*. There is, however, an impression that *S. Thunbergi* shares in its origin. It is of very graceful habit, its shoots being thin, wiry, and arching. During April they are completely covered on the upper side with compact clusters of flowers that are of the purest white. The leaves appear after the flowers, and are 1 to 1½ inch long, obovate, usually sparsely toothed, quite smooth, and of a light but vivid green. There are now several dozens of plants at Kew that have been raised by means of layers from a single plant. This plant was one of the first introduced to this country, and it was from it that the branch here illustrated (fig. 1) was cut. *W. J. B.*

FLORISTS' FLOWERS.

LARGE BLUSH SOUVENIR DE LA MAISON CARNATION.

THIS variety of *Carnation*, when grown in a pot, does not afford a good idea of what can be attained by liberal cultivation in a greenhouse border. Mrs. Jeffreys has so cultivated a plant at Burkhams House, Alton. The plant has been in the border for four years, and it is now 4 feet high and 3 feet wide, the foliage of the glaucous colour one likes to see in a *Carnation*. The gardener has cut from this plant fifty large flowers, and there are dozens more still opening upon it. Many persons write me to say that they cannot

FIG. 1.—SPIRÆA ARGUTA ×: FLOWERS PURE WHITE.

flowers with very marked spotting on the petals. In the same house were a handsome form of *Odontoglossum luteo-purpureum*, and a white form of *Cattleya Mendeli*, with a slightly tinged lip.

At the commencement of June, the plants of *Cattleya Mossiae* filled a house 120 feet in length, all the plants being then in flower, the majority of them for the first time, and it would be difficult to pick out a really poor variety from the lot. There were flowers ranging from white to the

the sepals and petals being very clear. Another beautiful form was *C. M. Wagneri*, a snow-white form, the plant in the best of health, and having five leads. *Cattleya citrina* succeeds here, and Mr. Gilmour remarked that it is liable to be injured by excessive watering.

Of *Laelia grandis tenebrosa* there is a very promising lot, some of the specimens filling 18-inch pans. *L. tenebrosa magnifica* was carrying six sheaths. In passing I noticed numbers of plants of *Cattleya*

grow Malmaison Carnations, and wish to know the reason. I have in my mind's eye one particular case, but as I was sure it was owing to lack of care or knowledge on the part of the cultivator, it will be enough for me to state how I found the plants on inspection. They were standing out-of-doors at mid-summer, on a gravel path in front of a vinery, in the full sun, and to all appearance the soil was dry as dust; moreover, the flower-pots were not nearly large enough. I presume this exposure was intended to "harden off" the plants, and such kind of treatment would do that with a vengeance. Another gardener could not succeed, and his treatment was the very opposite to that of the other; he had planted them out in a shady part of the garden in rich, deep soil, with the result that "spot" had set in virulently. As a fact, no one can succeed in growing Malmaison Carnations who does not attend to their needs at the right time, and treat them throughout the year as greenhouse-plants. They may be placed out-of-doors for part of the time in some districts, but not in those that are cold and wet. I have placed them out-of-doors when the flowering-period is over, i.e., about the end of June, until the middle or end of September, but not in a very exposed position. I have thought the plants benefited by this treatment—but, upon the whole, I think, it is safer to have them in a light, airy greenhouse all the year round; and even when they are not in flower, a light shade is beneficial in the hottest part of the day if bright—but full ventilation is necessary.

I have houses of two sizes for my Carnations, but both are span-roofed. The better house is that which is 18 feet wide, and has a stage in the middle and one at the sides; but I must say the plants do equally well in the low house, which has a path running down the middle, and only side stages—the plants are thus brought near to the roof, the flowers almost touching it. I have not as yet tried planting out, but Mrs. Jeffreys' success at Alton almost tempts me to do this. The cultivation of the plant in a pot has the advantage of convenience. In hot summer, red-spider causes much injury to the leaves, and aphids only a little less. All the varieties require plenty of rooting-space, a good, strong, one-year old plant needing an 8-inch pot; and it is necessary to pot firmly, and have well-drained pots, and to use a compost consisting of good fibrous loam three quarters, peat one-quarter, and one-quarter decayed manure. An 8-inch pot is, in garden parlance, a 24; but they are usually only 7½ inches in diameter at about 1 inch below the rim, and amateurs often make mistakes in the sizes of pots. A well-known amateur was instructed through his gardening paper to use so much artificial manure to surface-dress a plant in a 12-inch pot. He measured round the outside of the rim, and used it on a 48-size, and so killed his plants. Another detail of culture is, that the plants do not like an arid atmosphere, therefore it should be avoided by sprinkling the paths and the stages about mid-day in hot weather. Propagation is effected either by cuttings or layering. The cuttings or slips may be put on a frame with a slight bottom-heat at any season of the year, and kept close till roots form. Layering is done in July, and the layers are taken off and potted up early in the month of September. Besides the usual bluish and pink varieties of Souvenir de la Malmaison, those raised by Mr. Martin R. Smith, of Hayes from seed, are quite a revelation in regard to colour and form. There are amongst them the pure white Nell Gwynne; Lady Grimston, pinkish-white, marked with bright rose; Prime Minister, scarlet; Tumpeter, bright crimson; Sir Evelyn Wood, salmon-pink, striped bright red; Mrs. Everard Hambro, carmine-rose; Sir Charles Freemantle, deep rosy-pink; Princess May, rich deep rose; The Churchwarden, bright crimson scarlet. J. D.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

Autumn-bearing Raspberries.—Pull up, or cut down with a Dutch-hoe all suckers which spring up from the old stools of autumn-bearing Raspberries as soon

as the former appear, with the object of throwing all the strength of the parent plants into the development of the canes selected last March, and trained about 6 inches apart to strings twisted once round a series of sticks stuck into the rows at short intervals. These canes will produce fruit during the months of August, September, and October—in fact, until cut down by frost. A surface-dressing of short manure laid on between the rows is beneficial, tending, as it does, to increase the weight of the crop.

Management of Summer Growths.—All kinds of fruit-trees call for extra attention during this month and the next in the matter of pinching and training the young growths. Trees of the Peach, Nectarine, Fig, and Morello Cherry require extra attention in this respect, as the young shoots have to be kept thinned-out, the points pinched out of those retained after they have attained to a length of 18 inches or so, these being laid in between the shoots of last year's growth. Pears, Plums, and Sweet Cherries (on walls) require similar treatment, as do also espalier Pears and Apples. Standard and bush-formed trees should have the points of the shoots pinched if unusually strong. Superfluous lateral growths should be pinched hard back to one joint from the point of issue. This will promote a balance of growth. Red and white Currants, which are trained on walls having a north aspect, should have the fore-right shoots shortened, and the upright ones trained over the available space in the ordinary manner; topping shoots which are likely to draw the sap away from the weaker ones, for the reason mentioned above.

Syringing Wall-trees.—Much good is done by syringing stone fruit-trees on walls about 5 p.m. on sunny days, by freeing them from aphides and red-spider. If these pests be abundant, tobacco-water at the rate of one quart to four gallons of water, or the XL All Insecticide at the rate of one to thirty parts of water may be used, washing the trees with clear water the next morning. All trees of Plums, Cherries, and bushes of Currants, should be kept free from blight by the use of insecticides; clear water or liquid-manure (diluted) being afforded at the roots with the intent to increase of vigour.

THE KITCHEN GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

French Beans.—Seeds of French (Dwarf) and Runner Beans may be sown, to succeed the earlier sowings when these become exhausted, or it is desired to leave seeds of them for maturing. Without selection, rigidly and constantly carried on amongst vegetables, high quality cannot be maintained, and this is, as we well know, carefully carried out by our leading nurserymen and seed-growers, although not to the extent that it might be; the result being, that some of our once-famous stocks of different kinds of vegetables have dwindled out of cultivation to make place for others not one whit better, these being simply re-selections. In the case of French and Runner Beans, selection should be practised year by year, the straightest and longest pods being reserved from the early sowings, allowed to ripen, and carefully dried before storing them away. Beans sown at this date should be given a warm, yet open and sunny position, and a rich, well-tilled piece of land. Should the soil be dry at the time of sowing, afford the drills a heavy dose of water an hour or two previously. Those Beans that are in bearing should be liberally supplied with manure-water in dry weather, or the land top-dressed and afforded water.

Beetroot.—If the Beetroot crops have failed, wholly or partially and the seed laid long in the ground this year before starting, a sowing should at once be made of Pragwell's Exhibition, a quick-growing variety, producing roots of a useful size even when the seed is sown so late as July. Although a Beetroot plant may be readily transplanted, the practice cannot be recommended except filling up gaps in the rows; the roots rarely attaining to a useful size, or having a good shape. Turnip-rooted or Egyptian Beet comes in very quickly, and where early sown it is fit now for salads. It is the best variety for sowing on shallow soils.

Planting Green Vegetables.—Push on with the planting of the Brassicas; especially Brussels Sprouts which should be got out in good time. A good breadth of spring sown Cabbage, if planted at this season, comes into use before the early Savoy's are fit for table. Continue to plant late-sown Cauliflowers, the Savoy's, Broccoli's, Kales, &c., as space can be found for them, taking care when planting them on recently-dug ground to trample or otherwise make it firm. This

applies especially to Broccoli, for which the land cannot well be made too firm and hard. Afford water to all green crops till well established, then ply the hoe frequently between the plants. If seeds of Coleworts have not yet been sown, sow them forthwith on an open piece of ground, which, if poor, should be first well soaked with liquid-manure. As soon as the plants are large enough, transplant them on to well-prepared land at 1 foot apart. These are most useful greens, that should be extensively planted, coming in as they do at a time when green vegetables are sometimes scarce. Small sowings of Lettuce, Endive, &c., should be made at frequent intervals, but they will be best if sown thinly where they can remain, as unless the weather is very favourable, transplantation in hot weather is not very successful. Sow Radish seeds every week on a cool border, and water the beds well in dry weather, doing this while the sun is shining on the plants.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Ledbury.

Figs.—In the early house the trees carrying their second crop of fruit, now swelling fast, will require plenty of syringing with clear water, and an abundant supply of water at the roots. Any neglect of these points of culture will make the spread of red-spider almost a certainty, and then, if these foes get a footing, they will soon begin to attack the fruits, causing the so-called "rust." By using the syringe twice a day, and affording plenty of moisture at the root, red-spider will be rendered innocuous. Weak growths should be rubbed off, and those that remain tied-in as they grow, just keeping the points of the shoots from touching the glass.

Succession Fig-houses.—The fruits on the trees are ripening, and the plants should be kept dryer at the root, till all of the fruits are gathered, not, however, letting the soil get very dry, or the fruit will be small and not finish as it should do. Afford air freely whenever the weather is favourable, a little even at night being left on if the fruits exude juice. The second crop of fruits on these trees should be thinned to two on a shoot. Later trees will require attention in the matter of tying, taking care that the shoots do not become so crowded as to exclude the sunlight. All second-crop fruits showing on these trees should be rubbed off, it being now too late for these to come to perfection.

Cherries and Plums.—Most of the fruits of the former under glass will have been gathered ere this, and all trees that are grown in pots should be placed outside, and planted-out trees kept very cool. Remove surplus shoots, loosely tie the remaining ones to the trellis, and afford the trees a heavy syringing twice a week and plenty of moisture at the root, so as to keep the leaves fresh for as long a time as possible. Plums require a longer season to mature their fruits, and a good deal of care should be taken of them, especially not to let them lack water at the roots, but examining them twice a day as to the state of the soil. The growths that are likely to run away must be checked by pinching out the points, and the terminal shoots of trees on trellises should be tied in; and when the allotted space is filled, the points of these may also be pinched out. If slugs give trouble, tie a bunch of cotton-wool round the stems and uprights, and put a few Cabbage leaves about; they do not like crossing the wool, and may be caught at night on the leaves.

The Strawberry.—Preparation for layering should now be made, especially of the early varieties. I like to layer them straight into the fruiting-pots; as although this entails a little more trouble at first, it is well repaid, as once the roots get hold of the soil the plants go away without check, while another advantage of this method is that they do not require nearly so much attention in the matter of affording water—a point of consideration in the busy season. The only drawback is, that in a wet season the soil is likely to become soured before the roots get properly into it, but this does not often happen. See that the pots and crocks are clean, and that the potting compost is got in readiness and placed under cover. Choose for this purpose three-quarters friable loam, roughly broken, one-quarter lime-rubble, and about a 4½-inch potful of soot to every barrow-load, a little fresh finely broken-up Mushroom-dung being an assistance if the loam be not rich. I like to do without this last, if possible, as it is apt to decay, and get washed out of the soil by the water and rain, leaving the soil too porous. Fasten the runners on with pegs of Birch or bracken, in preference to stones, &c.

PLANTS UNDER GLASS.

By G. H. MAYCOCK, Gardener, Luton Hoe Park, Luton.

Carnation Souvenir de la Malmaison.—Layering may now commence, bringing the operation to a close quickly in order that the layers, when rooted, may have time to become well established in pots before winter. I prefer to do the layering in frames which have been in use for forcing Potatoes, Carrots, &c., these containing a good body of soil into which the plants can be turned out of the pots, the layering being carried on as the work proceeds. In layering this variety, the upward cut should not be made long, say about 1 inch, and the incision should be kept open when pegging the layer down in the soil. An inch deep of the latter above the layered joint is enough, the mould to be used in covering it being passed through a sieve with an $\frac{1}{4}$ -inch mesh. At the end of the job, afford the plants, layers, and all a good watering and close the lights. The layered plants are the better for a slight amount of shading for a week or two, but on no account should the frame be kept close or stuffy, and only healthy shoots should be layered.

Work in General.—The various plants which are intended to flower during the winter should receive close attention, not being allowed to suffer lack of water at the roots; those which have filled the soil with roots being plunged in coal-ashes. Let staking and tying be done betimes, or shoots may be broken off and many a nice plant disfigured; and carry on a constant war with the insects which infest the plants, making an effort to clear them of the pests before they have increased in numbers greatly. Those *Bouvardias* which were treated as previously advised, and are now growing strongly, may be stopped in so far as regards the stronger shoots, and some thinning-out may be called for, as well as additional space afforded the plants. *Primulas* will require their final potting, afterwards to be plunged up to the rims of the pots in cocoa-nut-fibre refuse in a cold frame, with their leaves near the glass, and shaded from strong sunshine. The plants of *Eucharis* of various species should be cleaned with an insecticide and water, in case mealy-bug should be present, and the pots containing them, it sometimes happening that mealy-bugs are found under the rims of the pots. Let the plants of *Eucharis* be placed in such a position that each is easily reached with a syringe which should be now used twice a day. Sow in boxes seeds of *Campanula pyramidalis*, *C. p. alba*, and *C. Medium* (Canterbury Bells); the seedlings will flower next year. *Cockscombs* and *Celosias* are liable to be infested with red-spider, and if syringing them with rain-water does not clear the plants of these pests, lay the pots on their sides, and employ a mixture of "fir-tree oil" in water. Let these plants be repotted before the roots get pot-bound. Young plants of *Euphorbia coccinea* and *E. pulcherrima* should now be in active growth, and checks of all kinds should be avoided, such as that brought about by abrupt changes in the temperature which causes the plants to lose their lower leaves; and do not crowd them together. *Zonal Pelargoniums* standing in pans, and intended for winter blooming, should be stood at a sufficiently wide distance apart that the air can circulate freely amongst them. Cut off the blossoms early, and afford the plants clear soot-water once a week.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Barford, Dorking.

Cypripediums.—Besides those plants mentioned in my Calendar of last week, there are some others which have finished flowering for the season, viz., *Cypripedium Stonei*, *C. Lawrenceanum*, *C. barbatum*, *C. Swainianum* ×, *C. Rothschildianum*, *C. Curtisii*, *C. Eurayle* ×, *C. Lebaudyum* ×, *C. Hookeri*, *C. ciliolare*, *C. selligerum majus* ×, *C. Eleanor* ×, *C. superciliale* ×, *C. grande* ×, *C. Sedeni*, *C. leucorhodium* ×, *C. macrochilum* ×, *C. Druryi*, *C. Dryanum*, *C. Schroderae*, &c., which, beginning to grow soon after flowering, it is prudent to examine in order to ascertain if additional rooting space be needed. If vigorous specimens are desired, the plants should not remain in a pot-bound condition. When re-potting, care must be taken not to injure the points of the young roots, as many of these are in active growth. The plants should be afforded just as much space as will allow for them to make two seasons' growth. The pots should contain clean crocks for one third of their depth, and as a compost some fibry peat, sphagnum-moss, and crocks, mixed well together. This should be put firmly about the roots, but not so that water cannot rapidly pass away. Place the re-potted plants

on the shady-side of the East India-house, and for a few weeks afterwards let the compost be kept merely moist, although re-established plants will require abundance of water. *Cypripediums* of all kinds should be examined occasionally for the mischievous yellow thrips which secrete themselves in the axils of the leaves. It helps to keep these insects in check, and is beneficial to the plants if a slight dewing overhead with a fine syringe be afforded at closing-time on warm days. It is not good practice to syringe such plants as *C. Stonei*, *C. Rothschildianum*, *C. javigatum*, *C. philippinense*, *C. Parishii*, *C. Sanderianum*, *C. exul*, *C. prestans*, *C. Lowi*, *C. Haynaldianum*, *C. Lebaudyum* ×, and *C. Sanderoselligerum* ×, the water remaining low down in the centre of the growths, and in the axils of the leaves, and causing decay.

Dendrochilum.—By this time *Dendrochilum* (*Platyclinis*) glumaceum will have made up its growth, and should be removed from the warm-house, and placed where the temperature is intermediate, affording the plants but little water at the root till growth has begun. The thin leaves of this plant should be frequently cleaned with a sponge and soapy water, in order to rid them of red-spider.

Temperatures.—With such warm weather as has prevailed during the past week, scarcely any fire-heat will be needed. In the East India-house the hot water-pipes should by night be made only just luke-warm; and artificial heat in the Cattleya-house will not be needed at night if the inside temperature keeps at 60°. Should, however, the external air be damp and chilly, it will be advisable to make the water-pipes luke-warm, otherwise the young growths of some species of *Cattleya* or *Laelia* may decay. A chink of air should be left on the top and bottom ventilators on warm nights. The *Odontoglossum*-house must be freely ventilated at all times, and the atmosphere kept well charged with moisture, except for a few hours during the middle of the day. Keep the plants well shaded so long as the sun shines upon the roof, and afford water only to those that are dry. On span-roofed houses, fully exposed to the sun all day, we find it beneficial to supplement the lattice-wood blinds with ordinary garden mats, placing these upon the glass so that a current of air passes between them and the blinds; by this means the inside temperature is kept 6° or 7° lower than that outside. When the sun is powerful, it is an advantage to syringe the mats several times during the day. In my experience, the *Odontoglossums* when exposed to the sunlight admitted through the lattice-wood blinds become red in the leaf, and the foliage does not last nearly so long as if it maintained a fresh green appearance. If these red-tinted leaves do not always fall off during the summer months, they do so as soon as fire-heat becomes a necessity.

THE FLOWER GARDEN.

By CHARLES HERRIN, Gardener, Dromore, Maidenhead.

Spring Bedding-plants.—The preparation of spring bedding-plants for next season should be carried on from the present time as opportunity offers. Cuttings of the under-mentioned plants will strike readily, if inserted in moderately light soil, surfaced with a little sand, and covered with a frame or hand-light. If these can be placed on the north side of a wall or high fence, less shading will be required, and in the cooler position roots will form very readily in the event of the weather being hot and dry. *Pansies* and *Violas* of all kinds may be struck now for replanting the beds in the autumn. *Cerastiums*, *Alyssum saxatile*, *Arabis* in variety, *Aubrietias*, and varieties of the double-flowered *Wallflower* may be struck where propagation by cuttings is carried out. Double *Daisies* and *Myosotis*, that were laid in temporarily previously to bedding out, should now be lifted and pulled into small pieces, each with its bit of root, which, if planted firmly in rather light soil, in a shaded or partially shaded position, such as a west or north border affords, they will make good plants by autumn, without the aid of frames or transplanting. During dry weather they will require to be frequently watered, until partially established. Several useful spring bedding-plants may also be easily raised from seeds to be sown forthwith, namely, *Myosotis dissitiflora*, *M. d. alba*, *M. alpestris*, and *M. alpestris Victoriae*, *Silene pendula*, and *S. p. alba*. *Candytufts*, and *Saponaria calabrica*, pink and white, should be sown a little later. *Nemophila insignis* is a useful spring-flowering plant, and if seed be sown towards the end of August, either broadcast,

or thinly in drills, strong plants for putting into the beds in October are obtained.

Bulbs.—Tulip and other bulbs removed from the flower-beds and laid in temporarily to ripen off should be lifted and placed on shelves in some open shed until dry, to be cleaned and stored as soon as an opportunity occurs. Where borders are devoted to *Daffodils*, and the bulbs require lifting and re-planting, this should be done as soon as the tops have quite died down, which is the case already with some varieties. For general garden culture it is not necessary to lift these bulbs annually, about every three or four years being sufficiently often, unless it is desired to increase the stock. The bulbs after lifting should be laid out thinly in a cool store to dry, and be afterwards looked over, and the largest and best selected for replanting, which should be done during this month. The smaller bulbs should be planted together in another part of the garden, or put out thinly on the margins of the shrubberies, and in semi-wild positions.

Humea elegans is frequently used in flower-garden arrangements, where as a central plant to a small bed, or placed at intervals over a larger one, in conjunction with a carpeting of other bedders, it is very effective, and continues to be so for most of the season. To raise plants for using in the beds next year, seeds should now be sown. Some care is required in sowing the seeds, and they should be very lightly covered with fine soil. Sow in a pan of light soil, and place in a cold frame, and keep shaded until the seedlings appear.

Roses.—We are now in the middle of the Rose season, and notwithstanding much green-fly, and the ravages of the maggot, the supply of good flowers promises to be quite equal, if not better than in the last two years. Standard *Briars* for budding should be looked over occasionally, and any surplus shoots removed, leaving two of the strongest and best placed for budding.

THE APIARY.

By EXPERT.

"Artificial" Increase, or Dividing Colonies.—A mania seems to have seized many of those keeping bees for increase of colonies otherwise than by natural swarming, if my correspondence is any criterion to go by, for at no time in my bee-keeping-life have I had so many inquiries in regard to this matter as during the past three months; therefore, to save so much private correspondence, I will give some of the plans which I use successfully, even though it is to quite a large extent matter which I have given before. But before doing so, I wish to say that for this locality (Berks) I prefer natural swarming to any plan of artificial increase when only one swarm is allowed from each old colony, and where the said swarm will issue in time to prepare both old and new colonies in good condition for the honey harvest. The first plan I will give for artificial increase is what is termed by some as the "nucleus plan." To be of the most value the nucleus should be "forced" eighteen or twenty days before the honey-harvest by having enough bees in it to protect a frame two-thirds full of brood, the larger part of which should hatch during the first four or five days, while the said comb should if possible contain some eggs, just laid. Besides this frame of brood and bees, the nucleus should contain a frame having a pound or two of honey in it, the whole being set in a hive and confined to one side of the same by means of a division board. The next day after making, a nearly-mature queen cell should be given, or a newly-hatched queen introduced. In about ten days, if all proves favourable, the young queen will be laying, when I go to the hive from which I formed the nucleus, and select a frame of brood, nearly all of which are gnawing out of the cells, and add this to the nucleus, always putting a frame of comb or comb-foundation into the old colony, to take the place of the one taken out, otherwise too much drone comb will be built, for colonies that are allowed to build comb under these conditions nearly always build drone comb. I now wait four or five days, when I go to the old colony and take out four frames of brood, from which all the bees were shaken as they were from the last-named frame, and carry them to the nucleus. I now fill each hive with empty comb or comb-foundation, and put on the surplus arrangement. By the above method, each colony is made of about equal strength, and the brood is so taken out of the hive, that the colony has no desire to swarm. The old colony will have the most field bees for the first week or so, but the other will soon make the stronger colony of the two.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Liters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR JULY.

SATURDAY, JULY 3	Société Française d'Horticulture, London. Isle of Wight Horticultural Association. National Amateur Gardeners' Association: Exhibition in the Royal Botanic Gardens.
WEDNESDAY, JULY 7	Horticultural and Rose Shows at Glasgow, Leeds, Hitchin, Tunbridge Wells, and Reigate. County Borough of Hanley Horticultural Fête (2 days).
THURSDAY, JULY 8	Durham, Northumberland, and Newcastle Botanical and Horticultural Society's Exhibition (3 days). Rose and Horticultural Shows at Bath, Harrow, Woodbridge, Gloucester, and Farnham.
SATURDAY, JULY 10	Rose Show in the Botanic Gardens, Manchester. Royal Botanic Society, Meeting.
TUESDAY, JULY 13	Wolverhampton Horticultural Show and Fête (4 days). Royal Horticultural Society's Committee.
THURSDAY, JULY 15	National Rose Society's Show at Norwich. Helenburgh Horticultural and Rose Show.
SATURDAY, JULY 17	New Brighton Horticultural and Rose Show.
WEDNESDAY, JULY 21	Beckenham Horticultural Show.
THURSDAY, JULY 22	Trentham and Hanford Horticultural Society's Show. Falterhebble and District (Halifax) Rose Show.
TUESDAY, JULY 27	Royal Horticultural Society's Committee. Tibshelf Horticultural and Rose Show.
WEDNESDAY, JULY 28	Chester Horticultural Fête (2 days). Carnation and Picotee Society's Show at Edgbaston Gardens, Birmingham.
SATURDAY, JULY 31	Liverpool Horticultural Association's Show (2 days). Royal Horticultural Society of Southampton Show.

SALES FOR THE ENSUING WEEK.

TUESDAY, JULY 6	Imported and Established Orchids at Protheroe & Morris' Rooms.
FRIDAY, JULY 9	Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three years, at Chislewick.—63° 2°.

ACTUAL TEMPERATURES:—

LONDON.—June 30: Max., 76°; Min., 60°.

PROVINCES.—June 31 (6 P.M.): Max., 70°, at York; Min., 54°, Aberdeen.

The Manuring of Orchids.

Two subjects frequently trouble the mind of the Orchid cultivator. One, the fact that certain Orchids, after a deceitful period of apparent vigour, gradually die off, and the other is the enquiry whether or not manure is requisite in Orchid culture. The two subjects are evidently co-related. Orchids may be "air-plants," requiring such food as may be derived from water and air in combination with light, but they would be quite unlike all other green-leaved plants if they did not require something more than this in the shape of nutritive matter derived from the soil. What part bacteria or

similar organisms play in Orchid life has not, so far as we know, been determined, but in all probability some of these have, as in other plants, the power of rendering the nitrogenous compounds in the soil available for nutritive purposes. Be this as it may, there is a distinct need for further information on the mode of existence and the life requirements of Orchids. This has led to some experiments on Cattleyas, the results of which are given in the *Comptes Rendus* for June 8. With a view to determine the cause of the gradual degeneration that takes place in some Cattleyas, MM. ALEX. HÉBERT and G. TRUFFAUT hit upon the expedient of analysing Cattleyas at the time of importation, and after some years when degeneration had set in. They took note also of the fact that the production of flowers is an exhaustive process, and that little is done to compensate for the loss.

The result of these experiments shows that Cattleyas when degenerate contain less dry matter, organic substances, nitrates, and ash. Amongst these elements, diminution is evident in the amount of potash, lime, magnesia, and phosphoric acid—that is to say, in the principal fertilising elements. The Cattleyas were grown in a soil almost destitute of fertilising matter, and their weakness is attributable to the production of the flowers for which they were cultivated. To verify this the experimenters proceeded to analyse the flowers, and discovered what amount of loss of fertilising elements these plants sustained as a consequence of flowering. It may be said that the organic matter of the flowers contains a considerable quantity of nitrogen, and that the ashes are particularly rich in potash, lime, magnesia, and phosphoric acid; the dwindling of Cattleyas in respect of these elements is therefore explained very clearly in this way, the results plainly showing that degeneration of these plants is attributable to the exhaustion caused by the production of flowers.

From the standpoint of practical horticulture we may conclude from this investigation that Cattleyas should receive, to counteract this degeneration, a mixture of suitable manures, containing nitrogen, phosphoric acid, potash, lime, and magnesia.

Mr. SMEE has also treated the same subject in a letter addressed to the Chairman of the Orchid Committee, which will appear in our next issue.

THE DECORATIONS AT BUCKINGHAM PALACE.

—Favoured with an invitation to witness the various decorations in the gardens at Buckingham Palace on the occasion of the garden party given by the QUEEN on Monday, June 28, we were enabled to view the various methods employed by Mr. OWEN THOMAS, the Head Gardener at Windsor Castle, in decorating the QUEEN's reception tent, the Princess of WALES' tent, and the several buffets erected under canvas whence refreshments were dispensed to the guests, numbering, we were informed, about 5,000. On the terrace was a long apartment, constructed of canvas, of appropriate colour, white and red, in stripes, and this on the side facing the buffet was decorated with a grand plant of *Areca Bausei*, 12 feet in height, surrounded at the foot with *Hydrangeas*, *Caladiums*, and other plants. Standing against the wall of the Palace were ten plants of *Cocos* in pairs, each about 15 feet high, surrounded with smaller masking groups of *Caladiums*, &c. This apartment, with its decoration lit up by electricity would have a good effect. An ante-room, also improvised for the occasion, was close by, and had an ottoman, the middle portion of which held a big bed of an Ivy-leaved *Pelargonium*—*Souvenir de Harry Turner*—that afforded a nice

effect, with its bright rosy-red flowers, and a fine plant of *Dracæna Lindenii* in the middle of the arrangement. The corners and the doorways in this apartment were flanked and filled, as the case called for, with tall Palms and flowering plants. The QUEEN's permanent tent, which is placed on the green sward on the west side of the Palace, was enlivened by outside groups standing to the right and left of the entrance. We noticed in these groups *Rhodanthe Manglesii*, and yellow *Marguerites* in broad bands, then came *Hydrangeas* white and pink; *Lilies*, and some Palms towards the back part. The Maple planted by the QUEEN on that day stands at about 50 yards from this tent. The Princess of WALES' tent was a circular one, ornamented with a round group in the middle, in which *Pelargoniums*, *Hydrangeas paniculata* and others, *Crotons*, *Kalosanthes coccinea*, and Ferns played the chief rôle. Plants of *Clerodendron Balfouriana* in flower, trained fanwise, were placed at the sides, with choice flowering subjects arranged in front of them. The QUEEN's marquee was of great size, and erected with closed ends and side, one side being left open. It was approached by a step or two stretching along the entire length of the open side, and contained groups of plants in the corners, each being backed by plants of *Clerodendron Balfouriana* in flower. The groups consisted of *Dracenas* with beautiful coloured leaves, *Crotons*, *Kalosanthes*, *Hydrangeas*, *Cannas*, *Lilium speciosum*, *Pelargoniums*, and *Hoteia*, which gave very rich colour effects. From the roof hung pendants of Roses arranged as globes, supported by festoons of Roses. The central group stood against the side of the marquee, and was, if anything, richer than the other in colour of flower and leaf, and in variety of the fine plants employed. We remarked *Richardia Pentlandii*, its rich yellow spathe contrasting with reds and scarlets of *Pelargoniums*, *Cannas*, *Rhodanthe*, the white *Antirrhinum*, The *Bride Gladiolus*, and *Hydrangea paniculata*. *Coleus* and *Roses* were used with good effect, the latter very profusely as pot plants, to form the encircling border. A bouquet of choicest Orchid blooms stood on each of the four tables. The entrance to this splendid marquee was suitably flanked with large groups of plants, including, among numerous species and varieties of foliage plants, some grand examples of *Cycads* and Palms. Four rows of *Roses* in beautiful flower encircled each of these groups.

LINNEAN SOCIETY.—The next session of the society will commence on Thursday, November 4, at 8 P.M. A report of the meeting held on Thursday, June 17, will be found on p. 11.

THE POST OF HEAD GARDENER AT WELBECK ABBEY.—The Duke of PORTLAND has appointed Mr. J. ROBERTS, formerly gardener to the late Baron LIONEL DE ROTHSCHILD, Gunnersbury Park, as head gardener at Welbeck Abbey in place of Mr. HORTON, who is retiring. Mr. ROBERTS kept the fruit and other departments at Gunnersbury in such condition that it is doubtful if the charge of Welbeck could have been confided to a more able man.

THE NEWCASTLE SUMMER FLOWER SHOW, which will take place on the 8th, 9th, and 10th inst., is to be held in the Recreation Ground. Valuable prizes are offered for *Roses* (including a special Victorian prize), and for table decorations, &c.

ISLE OF WIGHT.—A number of the members of the East Cowes Horticultural Society visited by invitation, on June 23, the rosary belonging to Mr. LEE-WHITE, president of the society. Mr. WHITE grows upwards of 600 plants, and this year, for the second time in succession, he has won the challenge cup offered by the Island Rose Society. Mr. S. HEATON, horticultural instructor, afterwards gave a lecture on the cultivation of the Tomato.

LIST OF SEEDS FOR EXCHANGE.—From the Botanic Gardens, Sydney, Mr. J. H. MAIDEN, the Director, issues a list of seeds available for exchange. It is the first catalogue of the sort sent out from these gardens, and includes, not only seeds therein ripened, but those of indigenous species collected from uncultivated plants. The Director hopes that a larger list will be forthcoming in future seasons.

FIG. 2.—THE ROYAL ORCHID BOUQUET, DELIVERED TO THE QUEEN AT BUCKINGHAM PALACE, ON JUBILEE DAY.
(The flowers were supplied by Messrs. Sander & Co., and the bouquet was arranged by Messrs. Wills & Segar. See p. 420, in our last issue.)

"HOOKER'S ICONES PLANTARUM."—The second part of the 6th vol. (May, 1897), has lately been issued. It is devoted mainly to plants of botanical interest selected from the Kew herbarium. Of *Bulbine mesembryanthemoides* (tab. 2528), a Liliaceous plant from South Africa. It is stated that the "two swollen leaves lie almost underground, and at the flowering stage have almost always lost by desiccation such part as protrudes into the hot pulsating karoo atmosphere. The underground part is alive and green, the ragged brown projecting tips are quite dead." *Pentzia virgata*, a South African Composite, is a valuable fodder plant in dry hot countries. *Euphorbia grandicornis* is a tall growing shrub, with thickened vertically ribbed and transversely constricted branches beset with long stout spines. Kew.

ROYAL PURVEYORS OF SEEDS.—We are informed that Messrs. DICKSON & ROBINSON of Manchester, seed merchants to H.M. The QUEEN, have just had the additional honour conferred upon them of being appointed seed merchants to H.R.H. The PRINCE OF WALES.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual outing of this society will take place on Monday, July 19, 1897. The programme includes a railway journey to Henley, which is reached at 10.55, then embarkation on launches at the Royal Hotel Landing Stage, and a journey made on the river to Greenlands; then dinner, followed by a trip down the river; tea, and return from Henley to London at 9.40. The train leaves Paddington at 9.32. Further particulars can be obtained from Mr. R. DEAN, Ranelagh Road, Ealing.

HAILSTORMS IN THE HOME COUNTIES.—We hear of considerable injury being caused by hail in Essex, Herts, and Bedfordshire, to farm and garden crops. Some of the extensive market growers in those counties have suffered severely, roofs of glass-houses and dwelling-houses having been penetrated by the hailstones, which were of considerable size. Our correspondent, Mr. MAYCOCK, of Luton Hoo Gardens, one of the places visited by the storm, and whose glasshouse resisted the hail, brought specimens of plants and young wall-fruits, Pears, &c., ruined by hailstone. His Chrysanthemums, which had made their first "break," have every point broken off, and nearly every leaf stripped from the stems. He possessed 1200 fine plants, not one of which is likely to be of any service as a decorative or show plant this year. Pea and Potato haulm, Lettuce, Strawberry foliage, young Broccoli, &c., have all been so defoliated and bruised as to be quite spoiled. Although these storms do not usually extend over very large areas, we fear that the loss in gardens in the districts visited will be very great. (See also p. 9 in the present issue.)

MESSRS. JOHN SHARPE & SON'S EMPLOYÉS OUTING.—The employés of Messrs. SHARPE & SON, of Bardney, were, at the invitation of Mr. W. H. SHARPE, invited to spend Monday, June 28, at Sutton-on-Sea, and a very pleasant day was spent by the party.

ANOTHER TOMATO DISEASE.—Some of our correspondents in Scotland, whose initials only we give, write:—"We have taken the liberty of sending you by post to-day a box containing four and a half Tomatoes which were pulled on the evening of Friday, the 18th ult., from a lot which seemed to be all going in the same way. The plants are fully 6 feet high, and are showing plenty of fruit ripe and unripe. So far as we can see, there is no appearance of disease or decay in the stems or on the leaves, and they are grown in wooden boxes with the best of soil. The two large fruits, when pulled last night, were showing a slight discoloration; this morning the discoloured parts have given way, as you will see. The half fruit, when pulled, was, to all appearance, perfectly sound, but in the centre you will observe a sort of core, with a growth. The two small fruits were pulled at the same time from other plants. The plants have been

grown in a very high temperature, but with no side ventilation, and Tomato-plants have been grown for years in the same house and under the same conditions without any sort of disease having shown itself, and we shall feel greatly obliged if you can give us any idea of the cause of this, and the cure. The fact that the plants are in perfect health to all appearance, has puzzled us, and we hope that you, from your great experience, will be able to solve the mystery. They were grown at a high elevation, and in Scotland we have had a cold and sunless spring. A. C." Our authority on fungus diseases of plants writes as follows, after an examination of the fruits, &c.:—"The disease is caused by Bacteria, and is very contagious, consequently fruits showing the least sign of disease should be gathered and burned. The disease is more general on the Continent than in this country. No cure is possible when the fruit is once attacked."

THE LATE DR. R. HOGG.—At a representative meeting of horticulturists held at the Horticultural Club on the 15th ult., it was resolved that a subscription should be entered into for the purpose of defraying the cost of a die for a medal to be presented to the Royal Horticultural Society, and from which medals could be struck and given for fruit under certain conditions, somewhat in the same way as the Banksian Medal. Mr. HARRISON WEIR kindly undertook to make a design for the obverse of the medal, the other side being a portrait of Dr. Hogg. A circular will be issued shortly for the purpose of obtaining the necessary funds; subscriptions not to exceed one guinea, and smaller sums will be thankfully accepted. These may in the meantime be sent if desired to Mr. HARRY J. VEITCH, who has kindly consented to be chairman of the committee, or to the Rev. H. HONYWOOD D'OMBRAIN, who will act as secretary.

PARAFFIN - NAPHTHALENE EMULSION.—The paragraph on this dressing for Hops and fruit trees, published in our last issue, is, as the patentee states in a letter received by us, a specification of his German Patent 88,566, 1896, a replica of his English patent, 13,201, 1895. This being the case, readers of the *Gardeners' Chronicle* should be warned not to infringe the patent rights, which are vested in an English firm. An arrangement has been made by which all residents in the administrative counties of Kent and Surrey can make any of the washes covered by the patent for their own use, and any such persons who apply to the South-Eastern Agricultural College, Wye, near Ashford, will receive full particulars for preparing the washes successfully. It has only been introduced to Hop-growers so far, and its superiority as a general wash for garden and greenhouse plants will shortly be brought before the gardening world.

HOME CORRESPONDENCE.

REDUCING THE HEIGHT OF TREE-FERNS.—Mr. Baxter has overlooked the principal point in my letter. I said that in their native countries they could be cut off at any height, and the top, if planted, would grow at once. I should not hesitate to treat any Tree-fern in this way, and should have no fear of the result. We cut 12 inches off ours, not because we dare not cut more, but because by so doing we keep the plant at the exact height we want. If there was any doubt as to the result, we should bind the stem round with moss, and keep this damp, until the roots had grown enough to make it safe to amputate. *Thos. Fletcher, Grappenhall, Cheshire.*

STRAWBERRY BEARING TRAINS TO EDINBURGH.—I happened to be at the Waverley Station last Saturday morning about 8 A.M., and saw the second special Strawberry-train run in from Kent. It consisted of twenty carriages, almost wholly freighted with Strawberries in small baskets with cross-handles, containing nearly two quarts each. The entire platform near the special was crowded with these and other fruit-baskets and punnets, consigned mostly to a few of the wholesale fruit-dealers of Edinburgh, being the second special on one morning. I took

the trouble to look round again later, and found that the whole of the Strawberries had disappeared before mid-day. One or more Strawberry specials come in every morning; the fruit arriving in superb condition. Glasgow, Aberdeen, Dundee, and other towns have also their Strawberry specials; and later on the current of commerce will be reversed, and the granite city and district will send Strawberries in special trains to London, Manchester, &c. Those of us who have been advocating for years the marketing of fruits in small quantities, thus linking producers and consumers as closely and promptly together as possible—are abundantly satisfied with these special Strawberry-trains filled with small lots. The baskets, made of peeled Willows, are strong and clean, and greatly strengthened by their handles of peeled Willows going across and under them. They are filled with fruit, without a leaf under, at the sides, or over them, and covered with sheets of water-proof paper, on which is boldly printed the names of the consignees. I have just purchased, unpacked, and helped to consume one of these baskets of Sir J. Paxton Strawberries that arrived by the fruit special this morning. There was hardly a stain on the basket, and the quality excellent throughout. Purchasers are charged sixpence on these baskets, to be repaid in full if returned to the wholesale or other dealers. Thousands of baskets are returned every night whence they came, and in such cleanly condition as to be ready for immediate use. This express collection and cheap carriage of empties, and the cheap returnable boxes, initiated and so successfully carried through by the Great Eastern Railway in the south, are satisfactory circumstances. Hitherto, and in almost all directions, returned empties have proved a dead weight on trade and commerce. But if baskets and boxes are cheapened to the lowest possible limit consistent with strength, security, and cleanliness, returned empties will become a trouble of the past. *D. T. P., June 29.*

MONARCH STRAWBERRY.—I planted a few runners of this variety last October, and they have exceeded my expectations. The plants are robust in growth, and they have produced an enormous crop for the first year, some of the fruits scaling 2 oz. I planted them by the side of Royal Sovereign and Noble, and gathered fruits from all three varieties upon the same day. This Strawberry is likely to be very popular in the South of England, as it will travel to Glasgow as well as Royal Sovereign will travel to London. In fact, there is very little difference in the fruit when it is two days old, which is an invaluable desideratum. *Kent.*

EARLY-FRUITING STRAWBERRIES.—In directing attention to some of the varieties of the Strawberry which possess leaves with short petioles, few of your readers resident in England would assume that I was not well aware that open-air plants south of the Tweed bloomed earlier than in the North, or that I had any intention of depreciating such a splendid Strawberry as Royal Sovereign, or other of Laxton's Seedlings, Veitch's Perfection, &c. But examining a group of Strawberries in the same garden, on the same day, I simply noted the fact that the Princess of Wales and Queen of Denmark were abreast of Garibaldi, the Prince of Wales forming a good third to the other two seedlings, and that all three varieties had smallish leaves, and short and slender leaf-stalks, which are valuable characteristics for early forcing. Of course, where space under glass is virtually unlimited (a rather rare occurrence even now, and wholly unknown in my early career), the size of the leaves and length of the leaf-stalks would be of less moment; but in most Strawberry-pits and houses, the shorter, more compact, and horizontal the foliage, the more, the finer, richer coloured, and higher-flavoured the fruit. And hence experienced growers in search of improved varieties, having satisfied themselves as to quality, are next careful to learn the habit and height of the varieties, that they may gather most fruit of the highest quality in the least time from the smallest area. *D. T. P.*

ROSES.—Why should the claims of fragrance in Roses be considered such a minor point of importance, and be left without any systematic reference in most catalogues and by most writers? Whereas there may be one lover among a hundred of this popular flower who exhibits, and therefore ignores fragrance, there are ninety-nine, or say 999 among 1000, who admire varieties on account of their relative fragrance. I raise my voice for the hundreds and thousands unrepresented in horticulture, to say

that Roses not fragrant be classed separately from those that are, as a feature more distinct than any other of real value. I refer to the pronounced fragrance of attar of Roses for my favourites, not the thinly sweet ones, and include La France, Sénateur Vaisse, and Prince Camille de Rohan, on the one hand, with such as Maréchal Niel, Belle Lyonnaise, &c., on the other, as the true types of fragrance, and hope this distinction may be carried into practice. H. H. R., Forest Hill.

PEARS.—Your article in the first special commemoration number, referring to "Fruits of the Victorian Era," surely errs in its reference to Pears, and in depreciating the character of old varieties, and naming the following as occupying no high rank to-day. I emphatically protest, for Marie Louise is barely superseded even by Doyenné du Comice, the only acknowledged peeress among Pears. Further, Citron des Carmes is the best of its season; and hardly less can be said about Williams' Bon Chrétien and even Jargonelle, provided the latter is grown on a bush, and picked just when coming off the stalk. Glou Morceau and Duchesse d'Angoulême (the latter if French grown, tons of which our neighbours across the channel send us annually) are equally meritorious, and, indeed, it strikes me that hardly any omission from your list could be made without excluding one of the very best and representative of the choicest eating Pears of the day, nor the two varieties of cooking Pears named from the class of the latter. H. H. R., Forest Hill.

THE RECENT HAIL-STORM.—On Thursday, June 24, a storm of great severity passed over parts of Middlesex, Herts, and Essex, accompanied by terrific thunder and lightning, doing an enormous amount of damage to property and crops. Crops of Wheat and Barley have suffered greatly, as in the track of the storm field after field can be seen where the hail cleared off all the ears. Trees are uprooted, and branches strewn in all directions, houses unroofed, chimneys blown down, windows have every pane of glass broken out. The storm came from the westward, and in my own house, three windows facing in that direction have lost every pane. Here, at Hylands, we are great sufferers, all the glass in most of the glasshouses in the kitchen and flower gardens is smashed to atoms. The crops of Cucumbers, Melons, Grapes, Peaches, plants, &c., are completely wrecked, and the crops entirely ruined. The bedding plants are broken down and battered into the ground. Market gardeners in the neighbourhood of Chelmsford have greatly suffered, among the principal sufferers are Messrs. Saltmarsh & Sons, F. Harris, Baddow Road; Edwards, St. John's Road; T. Simpson, Mildmay Road; and Messrs. Millers, Coval Lane; besides several other smaller market gardeners and private places. I saw plenty pieces of ice as big as thumb-pots, some weighing as much as 8½ oz. William J. Piper.

—At Chelmsford and district, Ponder's End, Enfield, Enfield Highway, Waltham Cross, Helleston, and Harrow, more than sixty nurseries suffered severe damage. Panes of 21-oz. glass of all sizes were completely riddled in some places, and considerable damage was done to the Grapes, Cucumbers, Tomatoes, and all kinds of plants in pots. Thirty of the sufferers were insured with the Nurserymen, Market Gardeners' and General Hailstorm Insurance Corporation, of 2, King Street, Covent Garden, who immediately assessed the damage done and paid the claims six days after. One nurseryman lost 70,884 square feet of 21-oz. glass, and his claim at 3d. per square foot amounted to £886 1s. G. M.

TWO HYBRID HEMEROCALLIS.—Having been disappointed in seeing the flowers at the York Show on Wednesday, the 16th inst., owing to the tents being all blown over, and made a complete wreck by a storm of wind, I wandered a little way further, and visited Mr. Yeld's garden at Clifton, which is pre-eminently one of Lilies, Iris, and Hemerocallis. The latter are found all over the place in every available nook and corner, producing hundreds of flowers of various shapes, sizes, and shades of colour. Mr. Yeld has taken much pains in crossing the various species of Hemerocallis, most of which are natives of China and Japan. Of the numerous crosses which have been raised by him, none attracted my attention so much as those named Frances and Flame; the former a very dwarf plant, with numerous large, bright yellow, trumpet-shaped, erect blossoms. Unfortunately, however, the raiser does not speak of it as being a robust grower, otherwise it would be an excellent subject for massing on rockeries and in other suitable

positions. The latter variety, which was obtained from Flava x Sieboldi, is, I consider, decidedly the better of the two, being showy and distinct. It makes vigorous growth, possesses ample foliage, and sturdy flower-stalks from 10 to 20 inches in height, forked at the top, and bearing eight to ten clear orange-coloured blossoms of about 4 inches in diameter and 3 inches long. The buds are purple or brownish-purple, highly polished, which colour is retained on the outer segments, even after the flower is fully expanded. Its freedom to flower may be imagined when I state that in a space of about 2 feet square there were forty flower-stems with more than 360 blossoms. R. Potter.

THE PROGRESS OF HORTICULTURE IN THE VICTORIAN ERA.—Will you permit me to make a suggestion which I feel sure would prove as pleasant as profitable to most of your readers. It is briefly to the effect that as your souvenir of the long reign of the Queen known to this or any age, you might republish, in pamphlet form and popular price, your record-articles on the progress of horticulture. Most appropriately associated with these should be your summary of progress chronicled June 18, 1887, in connection with the fiftieth anniversary of Her Majesty's accession. The summary of progress chronicled on January 8, 1891, in connection with the Jubilee of the *Gardeners' Chronicle*, would add greatly to the horticultural value and literary interest of such a memorial brochure. If without greatly adding to the cost, such a handy object-lesson between the then and now, the past of sixty years ago and the present of horticulture to-day, in say such genera as the Streptocarpus, Gloxinia, Begonia, Cannas, and Tomatoes of 1837 and 1897. Probably the most violent contrast would occur in the old rough red Tomato, which hardly anybody knew and fewer still cared for, and the crowded ranks of Tomatoes of all forms, sizes, colours, and flavours which struggle in vain to keep pace with the insatiable demand. And yet in these other classes some of us can remember when there were but one Streptocarpus Rexi, one Gloxinia (the blue insignia), not one of the present race of tuberous Begonias, and one Canna, or Indian Shot plant which was grown for its curious seeds as much or more than for its fine foliage or brilliant flowers, which had hardly begun to develop grandeur or beauty sixty years ago. D. T. Fish, Edinburgh.

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 29.—The meeting on Tuesday last in the Drill Hall, James Street, Westminster, was remarkable for an unusual number of exhibits. The Hall was full to overflowing, and the great bulk of the exhibits was composed of flowers or of flowering-plants. There was rather more fruit than is sometimes seen in early summer, but it did not occupy a great amount of space. Orchids were decidedly fewer than usual. One of the large central tables was filled with Roses, entered in competitive classes. The quality of the Roses, though not extra, was fairly satisfactory, and in each class there was considerable competition.

Floral Committee.

President: W. Marshall, Esq., chairman; and Messrs. Jno. Fraser, H. B. May, R. Dean, Geo. Stevens, James Hudson, J. F. McLeod, C. J. Salter, R. M. Hogg, J. Fraser, W. Bain, J. W. Barr, Chas. E. Pearson, Chas. E. Shea, H. J. Jones, H. J. Cutbush, Ed. Beckett, C. Blick, and Harry Turner.

Messrs. CUTBUSH'S Carnations were arranged in a large group immediately facing the entrance, and it was composed of plants of the Souvenir de la Malmaison type. The variety Princess of Wales was represented most largely, but there were also plants of the crimson-flowered Prime Minister, the striped Lady Grimston, the pale-flowered Blush, and a variety named Rose. The group was arranged effectively (Silver Flora Medal).

A magnificent group of Carnations staged by Mr. J. F. McLeod, gr. to J. P. MORGAN, Esq., Dover House, Southampton, consisted of large specimens, abundant in uncommonly clean and healthy foliage down to the base, and well flowered; the plants demonstrated in a remarkable manner the immense value of the Souvenir de la Malmaison type as decorative plants. There were upwards of thirty blooms on each of nine of these plants, and the blooms were large in size, and deep in colour. Faced and interspersed with Adiantum Fern, the group was a fine instance of successful culture applied to this type of Carnation, which have seldom, if ever, been exhibited in such condition (Silver-gilt Flora Medal).

An Award of Merit was recommended to Carnation Hempsden, flowers of which were shown by Mr. R. SMITH, Esq., The Warren, Hayes, Kent (gr. Mr. Blick). It is a salmon-rose coloured flower of fine form.

Tuberous-rooted Begonias were shown by Messrs. H. CANNELL & SONS, Swanley, Kent, in a very bright group indeed. Double and single-flowered varieties were displayed. Hon. Wilfrid Laurier, rosy-pink, with fringed margins; Rev. E. G. Little, bright crimson; Lady Lindsay, large soft yellow; Dr. Nansen, very dark crimson, were some of the best doubles; and of singles there were Golden Hind, Mr. Pack, W. Marshall, and others of capital quality (Silver Banksian Medal).

Messrs. JNO. LAING & SONS, Forest Hill Nurseries, obtained an Award of Merit for double-flowered Begonia Lady Pearson, very fine salmon-scarlet flower, unusually deep; and they also showed three choice varieties of Caladiums.

Messrs. JAS. VEITCH & SONS, Ltd., Royal Exotic Nursery, Chelsea, were awarded a Gold Medal for an exhibit on either side of the door consisting of a group of excellent Conifers, similar to those we noticed at the Crystal Palace last week, all of them capital specimens from the open ground, and representative of the most ornamental and distinct species and varieties. Many variegated forms were remarked; and a golden form of Libocedrus decurrens (Thuja gigantea) was awarded a First-class Certificate.

From Messrs. VEITCH were also shown flowering sprays of Indigofera decora alba, of the white-flowered Escallonia Philippiana, Robinia hispida, Calycanthus levigatus, with dull purple flowers; and Diervilla sessifolia, a yellow-flowered species; Hedysarum multijugum, Melosma myriantha, and a pretty variegated Phlox named Comtesse de Jarnac. Messrs. Veitch also had a collection of flowers of Sweet Peas neatly displayed in glasses upon white paper, relieved with Asparagus foliage. Both English and American novelties in these popular plants were well represented.

Ferns were shown by Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, in a group of plants which contained a choice selection of varieties and species of Adiantum of ornamental character. The collection of varieties was most exhaustive. An Award of Merit was gained by Adiantum fasciculatum, an erect-growing cuneatum-like Fern, with fasciculated pinnae—a very ornamental and desirable Fern. The group was awarded a Silver-gilt Banksian Medal.

Mr. W. WELLS, of Earlswood, exhibited a group of Chrysanthemums in bloom, most of them novelties, but not sufficiently in character, probably, to be reliable.

A grand display of hardy herbaceous plants in flower was made by Messrs. BARR & SONS, King Street, Covent Garden. Potentillas, Shirley and Iceland Poppies, beautiful varieties of Iris Kämpferi, Coropsis, Hemerocallis Thunbergi, and the much showier H. aurantiaca major, figured in *Gardeners' Chronicle*, July 20, 1896 (Silver Banksian Medal).

Mr. THOS. S. WARE, Hale Farm Nurseries, Tottenham, had a group of perennial and other hardy flowers, including a few plants of the smaller-growing species. Several of the rarer species of Lilium were noticeable in this representative group (Silver Flora Medal).

Messrs. KELWAY & SONS, Langport Nurseries, Somerset, covered a considerable table space with an exhibit of Delphinium spikes, Cannas, flowers of Gaillardia Irises, and a few perennial herbaceous species. The varieties of Gaillardia were capital, large well-formed flowers of distinct or brilliant colouring. The varieties of Iris Kämpferi were beautiful in every case, Beauty, Matchbox, Raphael, Amaryllis, Bride Elect, Langport Flood, Aphrodite, Mikado, Harry, Hercules, and Via Lactea, all distinct in markings. Messrs. KELWAY'S Delphiniums are well known, and in this instance some of the varieties were well shown (Silver Banksian Medal).

Messrs. J. CHAZAL & SONS' exhibit included a miscellaneous assortment of hardy herbaceous flowers, and a few sprays of ornamental-leaved shrubs, also Violas in sprays (Silver Banksian Medal).

Messrs. R. WALLACE & CO.'s exhibit from Colchester contained about a dozen spikes of the exceedingly showy Hemerocallis aurantiaca major, a feature in itself. Iris Xiphoides in variety, Lilium unbellatum, L. Thunbergianum, L. pardalinum, L. Parryi, yellow; L. Grayi, L. pardalinum californicum, a very pretty distinct spotted Lily with scarlet tips; the darkest coloured L. Thunbergianum, viz., Horstman, and many other choice Lilies. Calochortus Eldorado and C. venustus were shown in considerable variety, including a rare lot of C. venustus var. Cloth of Gold, a pretty yellow-flowered variety with very conspicuous blotches (Silver Flora Medal). Calochortus clavatus, shown by Messrs. R. WALLACE & CO., and C. G. VAN TUBERGEN, Jun., Haarlem, was recommended an Award of Merit. It is a strong-growing species, producing large golden-yellow coloured flowers, with purple anthers, and deep brown markings at the base of the flower. A very handsome and apparently free growing species.

Another excellent collection of hardy herbaceous flowers was staged by Mr. M. PRITCHARD, nurseryman, Christchurch, which included a very comprehensive list of choice species (Silver Banksian Medal).

Messrs. DOBBIE & CO., Rothessay, N.B., and Orpington, Kent, made a gay display with a large variety of Sweet Peas; also Violas in sprays, in great variety; and a good collection of Fancy Pansy blossoms (Silver Flora Medal).

Sweet Pea Cupid, with pink-coloured flowers, was exhibited by Messrs. W. BURRIS & CO., Philadelphia. It was well flowered, and very pretty as grown in pots, but specimens in the open ground appear to fall in the same respect as does the white form. Several other Sweet Peas from the same firm are of much excellence, especially Aurora, a rose and white-coloured variety.

Mr. J. G. FOSTER, Brockhampton Nurseries, Havant, had a collection of Sweet Peas in numerous varieties (Silver Banksian Medal).

Mr. J. Lamb, Burton Joyce, Notts, exhibited flowers of a White Pink, named Albino, which received an Award of Merit at the last meeting.

Sir TREVOR LAWRENCE, Bart., Burford, Dorset (gr., Mr. Bain), exhibited specimens of a robust Forget-me-Not, named *Myosotis palustris grandiflora*.

Messrs. F. SANDER & Co., St. Albans, in conjunction with a few Orchids, staged a group containing some excellent "picture" plants and others. The new double *Petunia*, named Mrs. Fred Sander, and figured in these columns last week, was shown in much beauty, and a few very strong plants of the pure white-flowering *Watsonia Ardernei*, which had spikes upwards of 4 feet high, each of which produced five or six-score of blooms. Then there were *Begonias* with very prettily-marked foliage, *Anthuriums*, and other plants. A Botanical Certificate was awarded to a pretty, slender-looking *Encephalartos*, named *gracilis*, having narrow leaves, and being much lighter in appearance than most of the *Encephalartos*. The group was awarded a Silver-gilt Banksian Medal.

ROSES

Mixed Class.—The class for twenty-four single trusses was won by T. B. HAYWOOD, Esq., Woodhatch Lodge, Reigate (gr., Mr. C. J. Salter); S.-Marie Rodocanachi, Captain Hayward, Gustave Piganeau, Marchioness of Londonderry, François Michelon, Caroline Testout, Louis Van Houtte, La France, Horace Vernet, L'Havre, and Beauty of Waltham, were the best flowers in a satisfactory stand. C. J. GRAHAM, Esq., Wrydelands, Leatherhead, was 2nd, whose collection was composed of an even lot of flowers, most of them of good colour, but lacking in size and substance; 3rd, the Rev. J. H. PEMBERTON, Havering, Essex. Several other stands were in competition.

O. G. ORPEN, Esq., Hillside, West Bergholt, Colchester, won the class for twelve single trusses, distinct, by far the best bloom being Kaiserin A. Victoria. Mrs. W. J. Grant, also very fine, was rich in its distinctive colour. Very little behind was the Rev. A. FOSTER-MELLIAH, Sproughton Rectory, Ipswich. The blooms from this well-known amateur were larger but less perfect in form, Maréchal Niel and Germaine Caillot were the best.

The best six blooms distinct came from G. W. COOK, Esq., The Briers, Torrington Park, North Finchley. The varieties, Captain Hayward, Caroline Testout, Ulrich Brunner, Mrs. Jno. Laing, La France, and Medea, were very commendable. The Rev. F. PAGE ROBERTS, Scole, Norfolk, was 2nd.

The best stand of nine single trusses of one variety was from C. J. GRAHAM, Esq., and the variety was Kaiserin Augusta Victoria, the blooms were of moderate size and good form. T. B. HAYWOOD, Esq., was 2nd, with Mrs. Jno. Laing.

The best six blooms of one variety were from O. G. ORPEN, Esq., Hillside, West Bergholt, who showed the same variety as the winner of the class for nine blooms. La France, shown by R. H. LANGTON, Esq., was 2nd.

Tea and Noisettes.—The 1st prize in the class for twenty-four single trusses, Tea or Noisette, was won by O. G. ORPEN, Esq., with a stand of blooms exhibiting moderate quality, except in a few instances, such as Bridesmaid, Ernest Metz, The Bide, Sylph, Souvenir d'Elise Vardon, Madame Cusin, &c., which were very good. C. J. GRAHAM, Esq., was 2nd, whose stand contained a good bloom of Cleopatra.

The Rev. HUGH A. BERNERS, Harkstead Rectory, Ipswich, was 1st for twelve single trusses, including good blooms of Catherine Mermet, Ernest Metz, &c. 2nd, the Rev. A. FOSTER-MELLIAH.

The winner of the class for six single blooms was Rev. F. PAGE ROBERTS; and R. H. LANGTON, Esq., was 2nd.

C. J. GRAHAM, Esq., was 1st for nine single trusses of one variety, showing Innocente Pirola; and O. G. ORPEN, Esq., 2nd, with Anna Olivier.

The 1st prize in the class for six trusses fell to R. H. LANGTON, Esq., who had Hon. Edith Gifford; followed by Rev. A. FOSTER-MELLIAH, who showed Souvenir d'Elise.

Messrs. W. PAUL & SON, Waltham Cross, Herts, exhibited a number of capital examples of cut blooms of Roses of their own introduction. The best of these were Spencer, Marchioness of Lorne, Enchantress, Star of Waltham, Pride of Waltham, Sylph, Clio, Duchess of Bedford, Waltham Standard, a fine Rose of a deep purplish-crimson colour; Aurora, deep pink in the centre, and pale pink outer petals, the latter reflexing—a charming flower. Marquise Litta, a French H.T., is what may be called a very deep rose-coloured Niphetos, the unexpanded flower-buds being remarkably nice-looking (an Award of Merit was obtained for this variety). Many more varieties were exhibited than those named above, and the exhibit was a beautiful and interesting one (Silver Banksian Medal).

Messrs. PAUL & SON, Cheshunt, were fortunate in obtaining three Awards of Merit for H. T. Roses. One of these was Souvenir de President Carnot, which in bloom and foliage is suggestive of Souvenir de la Malmaison, but the former has a curious drooping character, and the blooms are probably more Tea-shaped. They are white to faintest blush in the centre, and of excellent form. Madame A. Chateau, also a hybrid Tea variety, is almost a new shade of colour in Roses, and may be described as warm reddish rose, fading to pale pink in the outer petals. The 3rd award was to Kaiserin Augusta Victoria, an excellent white or pale lemon-coloured rose, now fairly well known.

LORD PENZANCE, Eashing Park, Godalming (gr., Mr. Baskett), who showed blooms of a number of hybrid Roses and Sweetbriars, demonstrated what splendid results have followed the work that has been done at Eashing Park.

Roses were also shown by Mr. WILLIAM RUMSEY, Joyning's Nurseries, Waltham Cross, and a fine lot of blooms the stand

contained, including some of the comparatively new and vigorous-growing variety, Mrs. Rumsey (Silver Banksian Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), de B. Crawshaw, E. Hill, J. Douglas, W. H. Young, T. W. Bond, J. Jaques, W. Cobb, A. H. Smee, S. Courtauld, R. Brooman-White, H. J. Chapman, C. Winn, F. Mason, and H. M. Pollett.

The feature of the show, so far as the Orchids were concerned, was the remarkably fine group of rare plants staged by Messrs. JAR. VITCH & SONS, LTD., King's Road, Chelsea, and for which they received a Silver Flora Medal. Among the many fine hybrids shown, the most remarkable was the new *Laelio-Cattleya* × *Eudora superba* (C. Mendelii × L. purpurata ?), which comes nearest to a fine form of L.-C. × *eximia*, but with colours lighter and brighter. The sepals and petals of the large perfectly-formed flowers were white, prettily tinged and veined with lilac-rose; the front of the lip rich glowing purple (First-class Certificate). Other remarkable hybrids in the group were the new *Spathoglottis* × *aureo-Veillardii*, greatly improved since first shown at the Temple; the flowers open light chrome-yellow, with purple spots, and the labellum has a purple apex, which on maturing changes to cream colour with the same purple markings; *Phalenopsis* × *Ludde-vioacea*, with bright rose flowers; P. × *Vesta* (rosea leucaspis × *Aphrodite*); the fine large rose-purple *Disa* × *Veitchii*, which bids fair to displace D. grandiflora as first favourite; *Dendrobium* × *illustre* (*chrysotoxum* × *Dalhouseianum*), and D. × *porphyrogastrum* (Huttoni × *Dalhouseianum*), two very fine hybrids; *Laelio-Cattleya* × *Canhamiana*, L.-C. × *eximia*; and the delicately-tinted *Sobralia* × *Veitchii*. Of the species there were fine pans of *Dendrobium Phalenopsis Schroderianum*, the handsome D. *glomeratum*, D. *Bensoniae*, strong, well-flowered specimens of *Phaius Humbloti*, *Epidendrum nemorale*, *Sobralia macrantha*, *Aërides multiflorum* Lobbi, *Anguloa Ruckeri*, A. uniflora Turneri, fine varieties of *Cattleya Mossiae*, C. Mendelii, and *Laelia tenebrosa*; *Cypripedium superbiens*, with twenty-four flowers; a fine pan of *Stenoglottis longifolia*, *Aeranthus grandiflorus*, &c.

Messrs. HUGH LOW & Co., Clapton, staged a good group composed principally of remarkably fine varieties of *Cattleya Mossiae*, including the white C. M. Wagneri, and C. M. Reineckiana. Among the coloured forms, C. M. maxima was a noble flower; and C. M. Bronze Queen had a richly-coloured lip, in which bronzy-orange predominated. Messrs. Low also showed *Cypripedium* × *Mrs. R. V. Low* (niveum × ?), of unrecorded parentage. It is of middle size, a very distinct flower, white, the petals and upper sepals lightly marked with purplish spots. The lip is laterally compressed, and shows a ridge in front, the whole flower being peculiar and attractive (Award of Merit).

In the group of miscellaneous plants staged by Messrs. F. SANDER & Co., were *Lycaste leucontha*, L. Mooreana (provisionally named), with green flowers of the L. gigantea class; *Cypripedium* × E. Holt (Curtisii × *prastans*), *Dendrobium infundibulum*, D. *speciosissimum*, *Sobralia Veitchii*, S. *Amesiae*; varieties of *Odontoglossum Harryanum*, one of which had very light-tinted flowers; *Cattleya Schilleriana*, *Aërides expansum*, *Stenoglottis longifolia*, *Miltonia vexillaria*, and *Calanthe Sanderiana*.

FRED HARDY, Esq., Tyntesfield, Ashton-on-Mersey (gr., Mr. T. Stafford), staged a small group, in which were three plants of *Miltonia vexillaria superba*; *Laelio-Cattleya* × *Hippolyta*, the very richly-coloured L.-C. × *Arnoldiana magnifica*; *Laelia tenebrosa Charlesworthii*, one of the darkest and richest in colour of the species; *Cattleya Mossiae* Wagneri and C. M. *Harlye*, the last-named a fine, large, pure white form with a slight tinge of lilac colour on the lip.

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), showed *Cypripedium leucocentrum grandiflorum*, resembling C. *bellatulum*, but with a wholly white lip. The plant was first known in gardens as C. *leucocentrum*, afterwards as C. *Godefroyae leucocentrum*, but this specimen more nearly resembled C. *bellatulum*. As it differs from both in the wholly white lip, the name *leucocentrum* is appropriate. Mr. MEASURES also showed the singular-looking hybrid *Cypripedium* × *Salus*, with greenish-yellow flowers tinged with purple—probably a C. *concolor* cross.

T. B. HAYWOOD, Esq., Woodhatch, Reigate (gr., Mr. Salter), sent two grand spikes, taken from his white *Miltonia vexillaria* "Daisy Haywood," which had previously been pronounced the best white variety, and awarded a First-class Certificate. The pure white flowers on this occasion measured 3 inches across the labellum, and exhibited no colour except a clear yellow mark at the base of the lip (Cultural Commendation).

Mr. N. BLANDFORD, Bitterne, Southampton, showed *Cattleya Warscewiczii* without the usual yellow spots on the lip.

Mr. H. A. TRACY, Twickenham, showed flowers of five good varieties of *Cattleya Mendelii*; and the Rev. F. PAYNTER, Stoke Hill, Guildford, sent *Phaius* × (Humboldt × bicolor), with sepals and petals yellow, tinged with red, and lip coloured dull rose, with orange lines at the base.

Fruit and Vegetable Committee.

Present: Messrs. Jos. Cheal, A. F. Barron, Jas. H. Veitch, Alex. Dean, Jno. A. Laing, G. H. Sage, Geo. Wythes, H. Balderson, J. Smith, W. H. Divers, G. Norman, and Robt. Fife.

The exhibits which came before the committee were few

in number; still, several very creditable productions were noted. It is notorious that Melons are lacking in flavour so far; and none of those brought before the committee on this occasion met with recognition, although the fruits left nothing to be desired on the score of size or appearance.

Melons were shown by Messrs. W. DAVIES, A. BISHOP, and C. MARTIN. Mr. G. Wythes, gr. to Earl Percy, Syon House, Brentford, showed a few shoots of the Loquat with ripe fruits (Vote of Thanks), and a yellow-fleshed Melon of good flavour named Thames Bank.

An exhibit of Peaches, similar to the one present last year from the same London district, came from Mr. G. Kelf, gr. to Mrs. Annot, South Villa, Regent's Park. It consisted of twenty-five fruits of Dymond as fine as it is possible to grow this variety; eighteen of Royal George of large size and grand colour; and Dr. Hogg, rather smaller than Royal George, but wonderfully bright in colour. A Cultural Commendation was awarded.

Mr. J. Hudson, gr. to Messrs. de ROTHSCHILD, Gunnersbury House, received a Cultural Commendation for an excellent exhibit of four dishes of as many varieties of Plums, the produce of potted trees. These were Kirke's, Early Transparent, Reine Claude de Comte Athènes, and Jefferson. He showed also dishes of Cherries Black Circassian, and Bigarreau Napoleon. Some fine, well-filled pods of Carter's Early Morn Pea came from Mr. E. Beckett, gr. to H. H. Gibbs, Esq., Aldenham House, Elstree.

Messrs. LAXTON BROS., Bedford, showed a new Strawberry named Mentmore out of Noble and British Queen, having much of the colour of the former, and the shape of the latter. It is, we should say, an improved Noble, and it is a heavy cropper (Award of Merit). This firm showed big fruits of Monarch, Commodore, Alma, and Leader, fine in point of size, and good bearers all, it is said; but we must know more about them. Thomas Laxton Pea is said to excel in earliness the Earliest-of-All, sown alongside of it on the same day. It has a large pod, with dark green marrowfat-shaped seeds. The height is 3½ feet. Fine long-pod Beans Bunyard's Exhibition, and Gradus Peas were shown by Messrs. KELWAY & SONS, Langport, Somerset.

The Lecture.

THIS was by Mr. J. CHEAL, and dealt with the "Storing and Preserving of Fruit." Commencing with small fruits, such as Currants, Gooseberries, Cherries, Strawberries, and Raspberries, a few hints were given upon the preservation of these by converting them into jam, and the process by which the fruits are preserved whole was explained. But to have fruits suitable for making puddings and tarts, it is necessary to "bottle" them, and this process was therefore described, and by means of several kinds of bottles, Mr. Cheal demonstrated how the old system of stopping by means of corks or skin may be superseded by various modern devices, which reduce the necessary labour to a minimum, and at the same time are decidedly more efficacious. Some of them are fitted with an india-rubber ring over which the stopper is screwed; and there are several patents, the principle of which consist in placing the stoppers over the bottle when at boiling-point, by which means air is excluded, and as the contents become cold, so are the stoppers hermetically sealed, with the pressure of the atmosphere above them. In order to unstop the bottles, the stopper has to be pricked, when it will immediately fall off. They may be soldered, and used again and again. (See *Gardeners' Chronicle*, May 2, 1896.) Plums could be maintained in natural freshness for some weeks by means of cold storage; but, as some experiments conducted by the Royal Horticultural Society a few years since proved, the temperature should be kept a little above the freezing-point; never below it, or deterioration ensues. Whether they are intended to be preserved thus, or by being made into jam, or by bottling, Plums should be gathered before they are fully ripe. Mr. Cheal then went on to describe the method of preserving Plums by means of evaporation or drying, and exhibited a small paraffin stove suitable for the purpose. Thick-skinned varieties were needed for this, and they should be submitted to an even temperature, the drying to be done at three times, between each of which the fruit should be allowed to become cold. To preserve Apples in the natural state, they should be kept cool, but not subjected to frost, unless very slight. The temperature should be as even as practicable, and the atmosphere not excessively dry. Directions for constructing a fruit-room likely to afford these conditions were then given, as has been frequently done in these columns. Mr. Cheal reminded his hearers not to shut up the fruit-room too closely before the Apples have been gathered long enough to become moderately dry. The preservation of Apples by evaporation was next alluded to, and an American machine displayed that peeled, cored, and cut up each Apple by a very efficient and quick method. The drying of Apples is done at one operation. Pears require a hotter temperature during storage than Apples, or the flavour is depreciated; and most of us know they are capable of being preserved in a very agreeable and satisfactory condition by means of bottling them in syrup.

The Rev. W. WILKS gave some interesting experience he had had in bottling fruits, and differed considerably from some of the details in the methods of Mr. Cheal, notably in adding cold water to the fruit before the bottles are heated, instead of applying boiling water afterwards. Mr. Wilks, however, was able to declare that all fruits were capable of being preserved in splendid condition in bottles, for ten or probably a hundred years, and he wisely recommended all amateur fruit-growers to give the process a trial, and thus economise their supply of fruit.

LINNEAN SOCIETY OF LONDON.

JUNE 17.—Dr. D. H. SCOTT, F.R.S., exhibited original preparations by Prof. Ikano and Dr. Hirase, of Tokio, Japan, illustrating their discovery of spermatozooids in two Gymnosperms Phanerogams, namely, *Ginkgo biloba* and *Cycas revoluta* (cf. *Bot. Centralblatt Bd., lxxix.*, Nos. 1-2, 1897, and *Annals of Botany*, June, 1897). The slides showed the spermatozooids while still in the pollen-tube before the commencement of active movement. In the case of *Ginkgo* one section showed the two male generative cells, closely contiguous, and enclosed in the pollen-tube. The general structure resembles that in many other Conifers at the same stage, e.g., *Juniperus virginiana* and *Pinus silvestris* (Strasburger, *Hist. Beitrage*, iv., pl. 2). In *Ginkgo*, however, each generative cell showed a distinct spiral coil, situated in each cell, on the side remote from its neighbour.

Another preparation of *Ginkgo* showed a series of sections across the micropyle, passing through a pollen-tube and its generative cells, the plane of section being in this case approximately parallel to the surface of contact of these two cells, through which four of the sections passed. In the two terminal sections of this series the spiral coil was clearly shown, consisting of about three windings. The spiral is connected with the nucleus of the cell, but whether it is itself of nuclear or cytoplasmic origin is not certain.

In the preparation from *Cycas revoluta*, several pairs of generative-cells were shown; in some cases the pollen-tube enclosing them was intact. The spiral coils in some of the generative-cells were surprisingly clear, consisting of about four windings. A distinct striation was visible in connection with the coil, probably indicating the presence of the numerous cilia described by the Japanese discoverers.

The facts admit of no other interpretation than that given by these authors, namely, that in both *Ginkgo* and *Cycas* each generative cell gives rise to a spiral spermatozoid; the latter, by its own movements (actually observed by Dr. Hirase in the case of *Ginkgo*) no doubt travels from the end of the pollen-tube to the female cell.

Mr. MILLER CHRISTY, F.L.S., read a paper on "Primula elatior, Jacq., in Britain." He remarked that this widely-distributed continental plant, though figured accidentally in *English Botany* in 1799, was not really detected in Britain till 1842, to which time the totally distinct hybrid Oxlip (*P. acaulis* × *veris*), was, by British botanists, confused with, and mistaken for it, as is still frequently the case. In Britain, *P. elatior* occupies a sharply-defined area, divided by the valley of the Cam, with only two outlying localities, so far as Mr. Christy could ascertain. This area covers the two most elevated and unbroken portions of the Boulder Clay district, the loams and gravels of the river-valleys and the chalk being entirely avoided. The boundary-lines (some 175 miles in length) which had been traced by Mr. Christy with precision were, in consequence, very sinuous. They enclosed together about 470 square miles, over which area the Oxlip flourishes in immense abundance in all old woods and some meadows; while the Primrose (which grows all around) is entirely absent. Along the dividing line between the two, which is very sharply defined, hybrids are produced in great abundance. On the other hand, the Cowslip (which grows both around and throughout the Oxlip-area) very rarely hybridises with it. Mr. Christy believed that the Primrose was, in this country, gradually hybridising the Oxlip out of existence. He then noticed a rare single-flowered variety of *P. elatior*, which he proposed to call *var. acaulis*, and several aberrations, showing upon the screen photographic views of these and of the hybrids, as well as a map of the distribution of the Oxlip in Britain.

Sir JOHN LUBBOCK, Bart., M.P., F.R.S., communicated the substance of a paper entitled "Further observations on Stipules," in continuation of a former paper communicated by him to the Society on March 18 last. The present paper, which was illustrated by diagrams, has reference, *inter alia*, to the Ash, Hop, and two species of Pea (*Lathyrus grandiflorus* and *L. pratensis*).

RICHMOND HORTICULTURAL.

JUNE 23.—This annual early summer exhibition was, as usual, held in the Old Deer Park, and in magnificent weather. The show was, both in extent and quality, materially below its earlier character, due largely to the fixing it upon the day immediately succeeding the Jubilee holiday.

Honorary Groups.—These usually constitute at Richmond the most prominent features, and it was so again this year, in spite of some notable absentees. Foremost comes a splendid group of Malmesdon Carnations, sent by Mr. McLeod, gr. to J. P. MORGAN, Esq., Dover House, Rotherhampton. Most of these plants were but twenty-two months old, but were literally bushes, and each one will next year be permitted to carry fifty blooms. So fine in form and culture were these, that the Special Silver-gilt Jubilee Medal provided was awarded to the group.

Mr. HENRY LITTLE, of Twickenham, through his grower, Mr. Howard, put up a fine collection of Orchids, including Cattleyas, Laelias, Cypripediums, Miltonias, Odontoglossums, &c., in great variety, and showing high culture. This group was awarded the Special Jubilee Silver Medal.

Mr. G. Wythes, gr. to Earl Percy, Syon House, had a fine miscellaneous group of plants; this included Orchids in variety, Carnations, Lilies, Xorais, &c., and made a very attractive feature. Mr. A. Pantrey, gr. to A. J. HOWARD, Esq., Norton Hall, Isleworth, had a nice group of Carnations chiefly. Messrs. J. CARTER & Co. had a very striking central feature in the large tent—a big group of

Petunias, Gloxinias, Tropaeolums, &c., arranged effectively on a low table, and over which were the long arms dressed with moss and Asparagus, as seen at the Temple Show.

Decorative Groups.—Those of the larger area included a very beautiful one from Mr. H. E. FORDHAM, of Twickenham, who took the 1st prize, quite in this exhibitor's best form, and had a base of Gloxinias, very brilliant in colour, and above them small Gypsophila paniculata, set into Maiden-hair Fern, with Lilies, Palms, &c., above. To this group was awarded the special Jubilee Bronze Medal. Mr. J. Gibson, gr. to E. W. WATTS, Esq., Chislewick, was 2nd; and Mr. W. VAUSE, Leamington, 3rd.

Specimen Plants.—These made a poor show, the only fine flower coming from Mr. VAUSE. He had *Pimelia Diosmyfolia*, *Bougainvillea Sanderiana* and *glabra*, *Erica ventricosa*, *grandiflora*, &c.

Pelargoniums.—Mr. C. TURNER, at the hands of that veteran grower, Frost, put up a large group of large-flowered and six fine plants. Just then, in superb bloom, Gold Mine, Marguerite, Duchess of Norfolk, Spotted Beauty, Magpie, and Magpie taking the 1st prize, and was similarly honoured with six beautiful fancies, including The Shah, Delicatum, Mrs. Hart, East Lynne, Ambassadors, and Princess Teck.

The only and very fine semi-pyramidal Ivy-leaf Pelargonium came from Mr. Watts, gr. to Mr. HENRY LITTLE, the best being Massinette, Jubilee, and Gallie. This exhibit also had six very superbly-flowered zonals in Kentish Fire, Alfred Ware, Constance, S. Birkin, J. Miller, and Mores. Mr. J. Smith gr. to W. H. ODLAM, Esq., 2nd.

Orchids, &c.—Mr. H. LITTLE had the best six in a fine Vanda teres with twenty spikes of bloom, a grand Cattleya Warneri of the most beautiful colour, also Cattleyas Mossiae, gigas, imperialis, and Mendell magnificas and Laelia tenebrosa gigantea; Mr. W. H. Young, Orchid Grower to Sir F. WIGAN, Clare Lawn, Sheen, was 2nd, with a fine Cymbidium Lowianum, Miltonia vexillaria, Phalaenopsis Sanderiana, Laelia tenebrosa and Laelia-Cattleya Arnoldiana. Gloxinias were fair, Begonias rather poor plants, and Coleus, &c., indifferent.

Roses were put up in fair abundance, but the blooms soon suffered from the great heat. Mr. B. R. CANT, Colchester, was an easy 1st in the class for forty-eight trebles, and also for twenty-four trebles.

Mr. G. PRINCE, of Oxford, was 1st with twelve trebles, having all Teas. These included Comtesse de Nadailac, Alpha rosea, Golden Gate, The Bride, Princess of Wales, Souvenir d'un Ami, Marie van Houtte, &c. Mr. CANT was 2nd.

Mr. CANT had the best twelve Roses, one variety, H. P.'s, in Mrs. J. Laing; and Messrs. PRIOR were 1st with twelve Teas.

No hardy flowers were visible from anyone.

Bouquets, Table-stands, &c., were largely shown, but even these things were much below average. In most classes for table-stands some professionals of one family seemed to sweep the board.

Fruit.—The best six dishes in a collection came from Mr. Ford, gr. to W. H. ELLIS, Esq., Clovelly, Hounslow, who had good Black Hamburg and Foster's Seedling Grapes, Brown Turkey Figs, Peaches, Nectarines, Strawberries, and a Melon. Mr. W. Tidy, gr. to W. H. D'ARCY, Esq., Stamore Hill, was 2nd, with small, neat bunches of Grapes, good Early Alfred Peaches, Lord Napier Nectarines, &c. Mr. OSMAN, Chertsey, was 3rd. The best three bunches of Black Grapes, capitally finished Madresfield Court were put up by Mr. Blake, gr. to the Earl of OSSLOW, Clondan Park, Guildford; Mr. FORD coming 2nd, with fine though hardly finished Black Hamburgs.

Mr. TIDY was 1st with three bunches of White Grapes, in hardly ripe Foster's Seedling; Mr. OSMAN being 2nd with medium Muscat of Alexandria.

Mr. J. GRAY, Bodorgan, South Wales, had the best dish of Peaches, in Crimson Galand; and Mr. TIDY the best Nectarines, in good Lord Napier.

Mr. G. PARKER, Isleworth, came 1st with two dishes of Strawberries, in big James Veitch and rather rough President; Mr. J. GOODY, of Twickenham, who came 2nd, had also fine Jas. Veitch and distinctly handsome Sir J. Paxton.

Mr. FORD was the only exhibitor of Figs, and also was 1st with handsome Perfection Tomatos.

Collections of Vegetables.—These were generally excellent. In the Society's class for twelve kinds, Mr. C. J. Waite, gr. to the Hon. Col. TALBOT, Esher, was 1st, having a splendid bundle of Asparagus, Cabbage, Telegraph Peas, Magnum Bonum Cauliflowers, Potatos, &c.

In Messrs. SUTTON & Son's class for six kinds, Mr. WAITE was 1st with fine Cauliflowers, Duke of Edinburgh Peas, Early Gem Carrots, Supreme Potatos, Perfection Tomatos, and Canadian Wonder Beans.

In Messrs. CARTER & Co.'s class for nine kinds, again Mr. WAITE was 1st, including here Leviathan Broad Beans, Model Cucumbers, Summer Favourite Carrots, Long White Marrows, Telegraph Peas, &c.

SUTTON HORTICULTURAL.

JUNE 29.—The sixteenth exhibition of this Society was held in the Town Hall, and was in every way a great success. The Roses were all clean, bright, and well formed; while the competition was well up to the average.

In the amateurs' division, R. E. WEST, Esq., Reigate, won for both twenty-four singles and eight trebles, beating Mr. A. SLAUGHTER, Steyning, in each class. Victor Hugo,

F. Michelon, General Jacqueminot, Horace Vernet, and Etienne Levot, were particularly good; but Mr. Slaughter was well ahead of Mr. West for twelve Teas or Noisettes.

In a division for growers of fewer than 2000 plants, Mr. Harris, gr. to E. M. BETHUNE, Esq., Denne Park, Horsham, was most successful, winning for twelve singles, six trebles, and for nine Teas or Noisettes. In each class he was closely followed by P. G. C. BURNARD, Esq.

Mr. M. HODGSON was equally successful in a division for growers of fewer than 1000 plants, beating Mr. H. P. LONDON for nine and six singles, also for four trebles. P. G. C. BURNARD, Esq., was a good 1st for twelve blooms of any Rose, with some very high coloured La France.

Mr. R. W. MILLER was well in front for twelve singles, and for nine ditto in the local classes.

Eight competed for the Ladies' Challenge Cup and National Rose Society's Silver Medal for six distinct Roses, Mr. W. HOOPER winning with excellent blooms, closely followed by G. A. V. SCHOFIELD, Esq., and Mr. R. W. MILLER.

In the nurserymen's class for thirty-six singles seven competed, and the first four were remarkably close. Messrs. HARKNESS & Sons, Bedale and Hitchin, were 1st, Mr. B. R. CANT, Colchester, 2nd, and Messrs. PRIOR & Sons, Colchester, 3rd. There was not a bad flower in these three stands, a d all were very bright and clean.

Mr. G. PRINCE, Oxford, won for twelve Teas and Noisettes; Messrs. PRIOR & Son, and Mr. B. R. CANT following.

Table decorations, bouquets, baskets, sprays, and other designs, were very tasteful, and clearly proved what can be done in this direction with Roses only.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

POTATOS.

With a lower tendency, present quotations are as follow:—Jersey Flukes and Kidneys, £9 to £11; St. Malo and Cherbourg, £8 to £9; Home-grown, various, £7 to £12. Old: Dunbars, 80s.; others, 20s to 40s. John Bath, Wellington Street, Covent Garden.

(Markets carried over to p. ix.)

NOTICES TO CORRESPONDENTS.

* * The publication of a large number of communications is unavoidably postponed.

AFFECTED STRAWBERRIES: C. T., Slough. The plants are overrun with the fungus-pest, *Botrytis vulgaris*. Spraying cannot be resorted to at this season with success. Sprinkle straw over the bed, and set it on fire. A month or six weeks after this is done, a crop of new leaves will appear, and then spray with a dilute solution of Bordeaux Mixture, or with a solution of potassium sulphide—1 oz to 3 gallons of water. Repeat spraying in the spring as a preventive until the bloom appears. G. M.

AN OLD-FASHIONED FLAT-ROOFED PINE-STOVE AS CATTLEYA-HOUSE: T. J. L. The house, judging by the effects produced on the plants, does not suit Cattleyas, although Vandas, Dendrobis, Angrecums, Lisochilus, some tropical species of *Cypripedium*, &c., would succeed therein. It is doubtless too hot, even in the summer when no artificial heat is used, requires shade for so many hours during the day when the weather is bright, and is not ventilated in accordance with the requirements of species coming from mountainous regions in the tropics or subtropical countries. Could you not raise the roof at the back, giving it a sharper slope, and adding at the same time to the cubical contents of the house, and provide ventilators near the ground-level, and so placed that the cool air impinged on the hot water pipes—a very necessary arrangement in the cooler months?

Books: *Hortus*. Schlich's *Manual of Forestry*, published in five vols. by Messrs. Bradbury, Agnew & Co., 8, 9, 10, Bouverie Street, London, E.C. No

periodical appearing weekly or monthly exists which deals with practical forestry. There is however a journal called *Timber*, and another *The Timber Trades Journal*. The Scottish Arboricultural Association publishes its proceedings.

FRUITS OF STRAWBERRY ROYAL SOVEREIGN: A. Boleman. These enormous, wedge-shaped fruits, which had a weight of 1 lb. 10 oz., were as magnificent examples of this excellent early variety as we have ever seen. For ordinary mortals we, however, like the smaller fruits, which are conical in shape, like one of its parents, viz., Sir Joseph Paxton.

GLOXINIAS: R. B. J., Ireland. The disease is caused by using "hard water." This causes the formation of an excess of oxalic acid, which injures the tissues; also combines with the lime present in the hard water to form crystals of oxalate of lime, which destroys the protoplasm of the cells. Rain water, or "soft water" should alone be used for watering. G. M.

HARTLEY'S ROUGH PLATE-GLASS FOR VINERY ROOF: Reader. The Vine in this country requires all the direct sunlight possible to mature its wood; and fruit should not be put under "rough plate," but under perfectly colourless large panes of strong glass, say 21 oz. to the foot square, without flaws or air bubbles. The Peach or Tomatos might succeed under rough plate.

LARCH: J. & Co. The insect destroying the Larch is the too-common Pine-weevil (*Hylobius abietis*). Hand-picking is probably the best remedy if the plantations are not too extensive. The surface of the ground below the young trees should be kept perfectly clear of anything that can afford shelter to the beetles. On the other hand, artificial shelter in the way of strips of bark, &c., may be placed beneath the trees, and the beetles that collect under these shelters should be destroyed daily. The application of quicklime, diluted paraffin, &c., on the ground beneath the trees, or as a wash to the trunks, has been recommended. The larvae live beneath the bark, and prefer recently dead wood, so that chips, stumps, dead branches, &c., should be carefully destroyed. The insect occasions great damage in this country, but still slight as compared with the destruction caused by it in continental forests. R. McL.

LILium BULB: C. D., Aberystwyth. The bulbs are swarming with the Eucharis bulb-mite, figured and described in the *Gardeners' Chronicle*, March 22, 1890.

MELONS: F. J. C. L. Your Melon is affected by a disease known as anthracnose, which is caused by a fungus called *Gloeosporium*. In the case of the fruit sent, there is a large discoloured and softened spot, which is surrounded by a darker ring. At present the fungus is not fully developed in the centre of this spot, and the spores are not formed. When once the fruit becomes attacked, it is hopeless to attempt to save it, for if the fungus is destroyed by applying a solution, the spot will remain. It is better to remove a diseased fruit as soon as the spot appears, and thus do all that is possible to prevent its spreading. M. C. C.

MUSHROOM-BEDS OUT-OF-DOORS: R. J. S. April was too late to make beds in the open; and, unless you have some underground-cellar, with a temperature of not more than 60°, you will not succeed. Fly-blown Mushrooms are only found in warm weather outside, or in over warm Mushroom-houses.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—Kent. *Euphorbia mamillaris*.—D. W., Glasgow. The two *Rubus* are either *R. nutkanus* (white flowers), or *R. odoratus* (purple flowers), or there may be specimens of both. The other plant is *Leptospermum flavescens*.—G. J. R. *Thuja orientalis* var. *filifera*.—R. T. W. A remarkably fine form of *Cattleya Mendeli*, the white tube to the lip and fringed front rendering it very conspicuous.—Constant Reader. The petals had mostly fallen, but in any case we cannot undertake to name varieties of Roses. Send them to some large grower.—R. W. P. 1, *Cnicus pratensis* (Meadow plume Thistle); 2, *Galeopsis Tetrahit*; 3, send when in flower; 4, *Monarda didyma*; 5, *Erigeron* sp.; 6, *Onosma taurica*; 7, *Polystichum angulare*.—E. M. 1, *Abutilon Couronne d'Or*; 2, A. Golden Gem; the Orchid is *Gongora galeata*.—H. G. The yellow flower is *Asphodelus luteus*. The garden Carnation we are unable to name.—H. P. 1,

Hieracium aurantiacum; 2, *Helianthemum Rose*; 3, *Buddleia globosa*.—G. D. 1, Ver probably a garden hybrid; 2, *Polypodium cum*; 3, *Galea officinalis*; 4, *Jasminum lulum*; 5, *Pyrethrum*; 6, *Ornithogalum lact*; 7, *Astrantia major*; 8, *Campanula ranunculoid*

ORCHID-BLOOMS: H. R. In the case of the *O. glossum crispum* and *Pescatorei*, the blooms are less broad in the sepals and petals. *Orchidiophiles* now prefer. The spray of *O. crispum* is of good length, and indicates a vigorous plant; but being newly imported, its vigour lessens under cultivation. You must wait. *O. Pescatorei* spray is rather weak, but the plants are normal, and this plant may improve. Bloom of *Cypripedium hirsutissimum* is a one.

ORCHIDS FAILING: L. P. The cause of the failure of orchids in the manner shown by the specimen has never been definitely settled. Some wrong in the cultivation may probably be the cause.

STRAWBERRIES: A. H. H. The fruits arrived in condition, and have the appearance of having been attacked by insects or vermin. Possibly the beetles mentioned in reply to A. G.

STRAWBERRIES DESTROYED BY BEETLES: A. G. The beetles are *Harpalus ruficornis* (a flat black beetle nearly half an inch long, with red legs and antennae belonging to the group of "ground beetles" (*Geophaga*), the members of which are notoriously voracious, but this particular species has only been developed an undoubted taste for ripe strawberries. It is universally common, and it is probable that its presence in destructive numbers in Strawberry grounds is connected with the practice of placing round the plants to prevent the fruit touching the earth. This litter harbour beetles; they lie concealed under it during the day and sallies forth at night to attack the fruit, therefore, the litter was turned over and exposed in the daytime, it is probable that thousands of beetles might be destroyed. As a preventive might be possible to saturate the litter with a substance noxious to the insects, but not liable to impart flavour to the fruit. It is a subject for suggestion or experiment by those interested. The beetle larvae live in the ground, and as strawberries are a standing crop, it is obvious that the number of beetles in a given field is liable to vastly increase year by year, unless they can in some way be checked. R. McL.

TOMATO: F. F. P. The injury to the fruits is a mechanical one, but due to a fungus known as *Cladosporium*, many times figured in these pages. Remove and burn every fruit that is attacked as soon as observed.

TOMATO FOLIAGE ATTACKED BY FUNGUS: J. E. The fungus is similar to the *Peronospora infestans* the Potato. The mycelium lives inside the plant, especially on its leaves, therefore sulphur Bordeaux Mixture are of little use against mycelium, but will kill the conidiospores, preventing the germination of conidia or oospores that may alight on the leaves. In so far as you use either with success. The following is a formula for making the latter:—6 lb. copper plate in warm water, placing this in a capable of holding about 44 gallons; in another vessel slake 4 lb. fresh-burned lime, making to a creamy white-wash with water; strain the water through coarse canvas into the barrel of sulphur solution; fill up with water, stir well, and the mixture is ready for use. For Tomatoes growing under it may be somewhat diluted. Diseased portions of the plants should be cut off and burnt before the mixture. As a precautionary measure, it may be used on quite healthy plants.

VINES ATTACKED BY FUNGUS: X. The disease caused by a well-known fungus—*Penicillium didymum*. Spray at intervals with dilute Carbolic Acid or potassium sulphide, 1 oz. to 3 gallons of water. This will check its spread. G. M.

THE Gardeners' Chronicle.

SATURDAY, JULY 10, 1897.

PLANTS OF THE VICTORIAN ERA. BRITISH FERNS.

ALTHOUGH, unfortunately, our British Ferns, in their developed varieties, do not for the moment find due appreciation at the hands of the general public, I trust I may be permitted, with an eye to the future, to include them in the list of plants which are now engaging attention in your columns under the above heading. If there be any range of decorative foliage plants which the patriotic Briton should be especially proud of, it is certainly this one, for no other, to my knowledge, is so peculiarly a native product, nor so particularly interesting in the fact that many of the most beautiful and charming forms have originated spontaneously in all their perfection in our native lanes, woods, glens, and similar spots in which our little islands are so rich.

Where is there another tribe of plants of which hundreds of distinct and beautiful varieties (I say nothing of the merely curious ones) can be brought together, and the honour and glory of their production be imputed in their entirety either to British environment or British selection? Take the pedigree of any other, and even if we owe the marvellous developments we now delight in to British care and culture, the starting plant (or plants, where hybridisation plays its important part), is or are usually exotic; while, in the majority of cases, there has been keen competition with the foreigner, fresh developments have been raised abroad and imported, and hence the merit is more or less cosmopolitan in every instance, and none of them can be claimed as purely and exclusively native. With our British Ferns, however, this is absolutely the case, for it is a curious and remarkable fact that although between thirty and forty years ago, these varieties were fashionable in England, and the number of native Fern-hunters largely increased as their capacity for spontaneous variation under natural conditions became more widely known, the fancy seems to have been almost exclusively confined to Great Britain, and although the species indigenous here have all a much wider range, being found in profusion in many other countries, the varieties which have been found abroad and imported can be counted on the fingers of one hand; and, in fact, the writer only knows of four. In this particular connection, indeed, the Queen's reign has practically witnessed the birth as well as the development of any true appreciation or knowledge of the varietal forms; and, in point of fact, of the normal as well, since at the time of her accession the whole process of reproduction of Ferns was a dark mystery, destined, however, to be cleared up seven years later, when Naegeli and Suminski announced their discoveries to the world.

Very early in the reign however, British Ferns began to be popular, and we find in 1844, Mr. Newman bringing out his capably-executed work, *A History of British Ferns*, in which the various species are well depicted and described, though the nomenclature varies considerably from that adopted to-day. But here, as in all the earlier books, the capacity for

variation is practically ignored, and Mr. Newman only figures four abnormal forms, viz., *Polypodium vul. cambrium* and *bifidum*, the incised form of *Asplenium trichomanes*, and a multifid variety (a very fine one, by the way) of *Athyrium filix-fœmina*, a counterpart of which he actually found himself in Co. Wicklow, and yet labels his picture "a monstrosity."

Mr. Newman devotes considerable space to detailing some minor differences in form of *Athyrium* and other species, which were then discussed as specific ones, botanists being at variance thereon; but there is not a word of allusion to the now well-known plumose and other crested varieties, of which we must assume his entire ignorance. Even the Hart's-tongue, though one of the figures has a multifid frond, is apparently unknown to him in any of its crisped or thoroughly tasselled shapes, and *Polystichum angulare* is only stated to have occasionally decomposite pinnules. It is fairly evident, therefore, that at this period there existed no collections of varieties, and that the wealth of forms scattered about the country was not in the least suspected. In 1863 the case was obviously different, since under that date a catalogue lies before me, issued by Mr. R. Sim, of Foots Cray, and in this we find a list of 320 British Ferns and varieties representing (deducting about forty specific normal forms) some 280 abnormal ones. As these are very fully described, an opportunity is thereby afforded of judging their merits; though, truth to tell, many of them are recommended because they are curious rather than beautiful, and a very large percentage would now be found with difficulty in up-to-date collections, as, owing to their defective or merely sub-varietal character, they have been ousted by better ones. Moore's *Nature-Printed British Ferns*, published previously in 1859, names, figures, and describes presumably the best extant and among those splendidly figured therein are some very fine things indeed, demonstrating that the cult was fairly launched and appreciated. Up to this time, however, the number of really good finds was comparatively small, and as the public taste seemed equally satisfied with eccentricities as with symmetrically beautiful varieties, selective culture on stringent lines of improvement was little attended to, and, as a result, a plethora of imperfect forms was thrown upon the market, which doubtless contributed ere long to surfeit and eventual neglect. A number of enthusiastic cultivators, however, not only formed very fine collections at this time, but continued to extend them, and began to turn their attention to systematic raising by spores from the best, with definite views as to improvements of type; and later on, when the reproductive process was thoroughly grasped, so too was the possibility of crossing and hybridising, whereby a large number of very interesting new forms were eventually raised. The pioneers in this direction were Col. A. M. Jones, Dr. E. F. Fox, Mr. E. J. Lowe, whose splendidly illustrated volumes, published in the seventies, *Ferns, British and Exotic*, *Our Native Ferns*, and *New and Rare Ferns*, must not be ignored in this connection; Mr. Clapham, Mr. Padley, and Mr. Carbonell; while many new finds were added by the careful hunting of Messrs. G. B. Wollaston, J. M. Barnes, Dr. Wills, J. Moly, the Stansfields, W. H. Phillips, and many others. By the joint efforts of finder and raiser (often combined in one and the same person), the number of known varieties became so great, that strict selection began to be felt as a necessity; the result being an immense improvement in type, fully as great in its scope, and exemplifying fully as much development when compared with the normal, as any other branch of horticulture can show during the Victorian Era. Twenty years ago only, the Kew collection of British Ferns was very small, and varieties were scientifically ignored. Thanks, however, to the persistent efforts of some of the pioneers above named, a fair collection was presented and suitably accommodated in the national gardens at Kew; and Mr. Carbonell dying shortly after, the garden was suddenly enriched by the bequest of his splendid collection to the nation, so that now some thousands of plants, representing hundreds of the best forms, fittingly attest the capacity of our home Ferns to decorate our parks and

gardens, slow though the lesson may be in the learning.

So far as regards numerical increase, some idea of this may be formed from Mr. E. J. Lowe's list, dated 1891, in which the forms actually described number 1,859, thus:—

<i>Pteris aquilina</i> ...	17	<i>Polystichum angulare</i> ...	304
<i>Adiantum cap. veneris</i> ...	34	<i>Polystichum aculeatum</i> ...	84
<i>Asplenium ad. nigrand</i> ...		<i>Lastrea filix-mas</i> and	
other <i>Asplenium</i> ...	125	other <i>Lastrea</i> ...	143
<i>Athyrium filix-fœmina</i> ...	313	<i>Polypodium vulgare</i> ...	75
<i>Scelopendrium vulgare</i> ...	450	Other species ...	274

of which no fewer than 1,119 are wild finds, without taking into consideration numerous forms repeatedly found.

The main thing, however, from the horticultural point of view, is not mere number but quality, and the advance in this direction of late years has been immense, as was evidenced, indeed, at the Royal Horticultural Society's Fern conferences and exhibitions of 1890 and 1892, since when some very fine additions have been made. The most marked advances have been achieved in the plumose sections of *Athyrium f. fœmina* and *Polystichum angulare*, some specimens of which have been developed into quinquepinnate forms of extreme beauty. The crispum Hart's-tongues have gone a step farther than frilling, and developed finely-cut fringes as well; while the crested Male Fern has yielded some unexpectedly beautiful varieties, Cropper's fimbriate forms, to wit, being marvels of delicate cutting. The cristate varieties have also progressed, and the union of this form of variation with that of the plumose has yielded some splendid combinations, *A. f. f. superbum pericristatum* being actually tasselled to the fourth degree. Mr. E. J. Lowe has raised some very remarkable Hart's-tongues, wherein the effects of crossing are multiform in the extreme; and finally, in this special connection of crossing, Mr. Schneider has demonstrated the practicability of imparting the varietal characters of our British species to allied foreign ones, his *Polypodium Schneideri*, already described in these columns, forming a triumphant demonstration, to say nothing of other successes on like lines. This, a comparatively recent feat, opens up wide possibilities for the future, since indubitably many exotics would not only be rendered more ornamental by the infusion of varietal character, but would naturally benefit constitutionally in addition.

We have therefore seen that the past six decades embrace to all intents and purposes the entire discovery of the normal life history of Ferns in general, and also the discovery and development of all our existing varietal forms, save some half-a-dozen or so. If we compare this advance with that of exotics we shall find, so far as actually discovered varieties are concerned, that any one of our prolific species has sported more than all the foreigners put together, the exotic Fern additions being mainly freshly introduced specific forms.

Of recent years, our British varieties have acquired greater interest than of old in the eyes of the scientific botanist, owing to the fact that the reproductive functions have also been found subject to variation and modification in very unexpected ways. A new varietal section has thus been found to exist, in which the fronds bear prothalli, and for the sake of future comparison this now embraces *A. f. f. Clarissima*, Jones; *A. f. f. Clarissima*, Bolton; *Scol. v. Drummondia*, Scol. v. (*aposporum*) Lowe; *Polystichum angulare* var. *pulcherrimum* (Padley, Wills, Moly), *Lastrea pseudo-mas cristata* (seedling), and *L. p. m. Cropperi* (D.), in all of which the life cycle is shortened by the elision of the spore, and in some cases, especially the last-named, by the elimination of sexual action altogether, the prothallus budding out from the frond, and the frond again budding out from the prothallus. *Chas. T. Drury, F.L.S., F.R.H.S.*

FLOWERS.

(Continued from p. 424, vol. xxi.)

CANNA.—The Canna has made a surprising advance in late years. Sixty years ago three species were in cultivation—*aurantiaca*, *indica*, and *iridifolia*. Its popularity dates almost from the time when John Gibson used it

with such excellent effect in his sub-tropical garden in Battersea Park. There were but few dwarf-growing varieties then, but continental raisers were not slow to see the possibilities of the Canna, and the improvements made during the last twenty years, and still in course of being made, are simply marvellous. M. Crozy has done wonders, and others, such as Messrs. Cannell and George Paul, are following the lead so given. The leading varieties of the present day are dwarf and strong in growth, the individual flowers large in size, and whether self-coloured, two or three-coloured, bordered or spotted, are superb.

CARNATIONS, PICOTEES, AND PINKS.

When the Queen came to the Throne there was an abundance of the bizarred and flaked Carnations, but not nearly so many Picotees—a fact leading to the supposition that the Picotee was a later development in time. From that time onward, the production of new varieties has gone on unceasingly; but the great impulse was given to its cultivation and improvement when, in 1851, the National Carnation and Picotee Society was formed at an exhibition held at Slough. Raisers innumerable added each their quota; the late Mr. E. S. Dodwell began to cultivate and raise seedlings at a time almost coeval with the accession of Her Majesty. Two varieties in particular—C. B. Admiral Curzon and P.P.B. Sarah Payne—have been grown almost the whole time the Queen has occupied the throne. The labours of Mr. Gyles, Mr. Douglas, and others, gave a new lease of life to the yellow-ground varieties; while the selfs and fancies have become a formidable section in point of numbers. Mr. Martin R. Smith has done very much during the last ten years to popularise the Carnation; he is the most prolific producer of new varieties at the present day.

The winter-flowering varieties have been improved quite as much as those of the summer-flowering types; and there is scarcely a period of the year when the Carnation is not in bloom. The Malmaison type has been considerably increased; many of the later-produced summer-flowering varieties rival the Malmaison in point of size. The new annual Margaret Carnations have not made the headway expected—the older types dominate. A garden without Carnations is unusual. As a cut flower it is almost unrivalled in our markets.

Its relative, the Pink, has declined as a florist's or exhibition flower. A goodly number of varieties were cultivated in 1837; the petals were fimbriated, wanting in substance, and the lacing defective. In 1848, Morris was a successful raiser, so was Young of Twyford, Dr. Maclean, Looker, and others; later in time, the Rev. C. Fellowes and James Thurstan carried on the work. As border flowers, the Pinks are held in high esteem, and the varieties increase rapidly. (See Report of the Carnation Conference, July 22, 1890, *Journal of the Royal Horticultural Society*.)

CHRYSANTHEMUM.

No flower has of late years made such remarkable strides in popular estimation as the Chrysanthemum. When the Queen came to the throne probably nearly one hundred varieties were in cultivation, but no classification existed, though the flowers were beginning to be publicly exhibited. Little was done in the direction of raising seedlings until 1836; but when Mr. John Salter went to Versailles late in the thirties [see note by R. Fortune in Mr. W. B. Hemsley's paper, published in the *Gardeners'*

Chronicle, vol. vi., 1889, pp. 521, 555, and 585. Ed.], he obtained all the best seedlings—those raised by Chevalier, Bernet of Toulouse, the first raiser of seedlings—and set to work producing new varieties, with what result is well known. The first genuine English seedlings were raised in Norfolk about 1835 by Short and Mr. Freestone. The first public show of cut-blossoms was held at Stoke Newington in 1846. In this year Robert Fortune brought what he called the Ohusan Daisy from China, which was the progenitor of the race of Pompon Chrysanthemums. In 1862 came the Japanese

CYCLAMEN.

Very remarkable also has been the progress made with the Cyclamen during the past sixty years. It was not until the forties that any serious attempts were made to improve the well-known *C. latifolium* (commonly but erroneously called persicum), by means of seeds. The type itself and the varieties obtained from it were regarded as early spring-flowering plants, and shy seeders. Fragrant types were announced in 1844. Messrs. E. G. Henderson & Son, of the St. John's Wood Nurseries, were among the first to add to the varieties, and the

FIG. 3.—*DIERVILLA SESSILIFOLIA*: FLOWERS YELLOW. (SEE P. 17.)

varieties, introduced by Fortune, and since, Red Dragon, Leopard, Jas. Salter, Hero of Magdala, and Garnet, all English varieties, were raised, wonders have been wrought in relation to its development; and had it not been for the introduction of this race, the Chrysanthemum would probably never have become so popular as is the case to-day. In plant-houses, in our markets, and at exhibitions of the flower, the Japanese type dominates, and no other flower has such a wide circle of admirers. Chrysanthemum societies are numerous, and exhibitions take place in all parts of the world where the English-speaking races abound.

possibilities of improvement once recognised, many undertook its culture. It is, however, only within the last twenty-five years that much marked improvement has taken place; the colours have been extended and deepened beyond all expectation, and the giant type of flower has been evolved. [See fig. 65, in vol. xxi., March 27, 1897.] The Cyclamen is now recognised as a late autumn and winter, as well as a spring-flowering plant. It seeds readily; it has become much more floriferous than formerly, and improved methods of culture have been made known. It can now be had in bloom from October until April and May.

DAHLIAS.

In 1837 many varieties of Dahlias were in cultivation. The *Dahlia Register*, published in 1836, gives a number of coloured illustrations of leading varieties. The fancy type was also existing, though apparently not then formed into a distinct section. The Pompon, or as it was originally designated, the Liliputian Dahlia, though having originated in Germany at the beginning of the present century, was not much cultivated in this country until the early part of the Queen's reign; the single form was re-introduced in 1880, and with it the Mexican

DELPHINIUM.

Sixty years ago the Delphinium was represented in gardens by *elatum*, *grandiflorum*, and *tricornis*, and some seedling varieties of each. We probably owe to the two first the early improvements seen in this popular perennial; and when, in 1840, the variety *Barlowi* appeared, and the rich blue *formosum* came from the East later, both were utilised for cross fertilisation, and their parentage is seen in the magnificent varieties of a very varied character produced in the present day. *Nudicaule*, with its pale red flowers, came from California in

FIG. 4.—ESCALLONIA LANGLEYENSIS. (SEE P. 17.)

species, *Juarezi* or *Cactus*. The last-named, somewhat frowned upon at first, worked a revolution in the estimate in which the Dahlia is held, and having since its introduction become considerably extended in its varieties and improved, it is now more widely cultivated perhaps than any other section. The single type became very popular for a time, but has now sensibly declined in public estimation. The Pompon type has undergone extensive improvement, and bids fair to become the most useful race for garden decoration. A single form of the *Cactus* type is not yet so popular as it may in course of time become. [See articles upon the history of the Dahlia, in *Gard. Chron.*, 1889, vol. xii., pp. 437, 524, and 557; also report of Dahlia Conference, in the *Journal of the Royal Horticultural Society*, vol. xiii., 1891.]

1869; and later, from the same country, *D. cardinale*. The Delphiniums are magnificent border plants, and deservedly popular.

FUCHSIA.

This genus in 1837 was represented by a few species, such as *serratifolia*, *macrostemma* and varieties of it, *coccinea*, *microphylla*, *fulgens*, and one or two others; but the value of raising seedlings had begun to be recognised. Messrs. Lane & Son of Berkhamsted, and Saltmarsh of Chelmsford, were seedling raisers among others at the time of the Queen's accession. In the early forties the pollen of *fulgens* was much used to secure hybrids. In 1839 *corymbiflora* was introduced from Peru, and in 1842 Mr. T. Cripps, of Tunbridge Wells, distributed, at a guinea a plant, the once popular *Venus Victrix*.

Raisers were early at work; Mr. W. H. Storey of Newton Abbot was a pioneer in the work, also Mr. E. Banks of Deal. The first white-corollaed variety came from France about the middle of the fifties, and a double form appeared soon after. New varieties are still raised, especially by Mr. J. Lye; but the *Fuchsia*, though yet extensively grown, does not command the attention it once did. Very fine exhibition specimens are still grown in the North and West of England.

GLOXINIA.

The Gloxinia during the latter half of the Queen's reign has shown a remarkable development. *Maculata* and *speciosa* were grown at the Queen's accession, one or two other species were imported in the forties, and seedlings soon began to show considerable variation. The earlier varieties bore irregular pendent corollas, and somewhat flattened; by-and-by, circular, erect, regular forms were originated, and now scarcely a pendent-flowered form is to be found in collections. It has also become quite a greenhouse annual, and seeds sown in January and up to March produce plants which, under proper management, bloom in four and five months. The collections now seen at the Temple and other large flower shows are superb, and appear almost incapable of further improvement.

HOLLYHOCK.

The Hollyhock was undergoing improvement at the time of the accession of the Queen, and Charles Baroni, of Saffron Walden, with others, was engaged in transforming it from a single to a double form. It was still more improved by Clarke, Paul, Chater, Roake, Parsons, and others, and it became a favourite exhibition flower with the florist. Some few years ago it was affected by a fungus, which, settling upon the leaves, destroyed the plants, and its successful culture was rendered difficult in consequence, many fine varieties becoming utterly lost. This disease still affects collections, but efforts are being put forth towards cultivating this plant more largely than within the past ten years, and raisers are at work obtaining new varieties.

LOBELIA CARDINALIS.

The American *Lobelia cardinalis*, and the Cape of Good Hope *L. erinus*, have both been turned to good account during the reign of the Queen, and the improvements made with both enrich our flower gardens during the summer months.

LILIES.

The genus *Lilium* has had important additions made to it. Sixty years ago some most useful species, such as *candidum*, *Martagon*, *tigrinum*, *croceum*, &c., embellished our gardens. *L. speciosum*, which has proved one of the most useful, had only recently come to our shores. The stately *giganteum* was imported in 1852. *Auratum* and *longiflorum* came in 1862—a fine form of the latter, known as *Harrisii*, is cultivated in very large quantities, as it forces well—and *pardalinum* in 1875. *Auratum* has produced many varieties, and it is a very handsome species, whether grown under glass or in the open border.

SWEET PEAS.

Since, in 1877, Mr. Henry Eckford took in hand the Sweet Pea and cross-fertilised it with a view of extending and improving the few varieties then in cultivation, there has been a most remarkable advance. It is a singular fact that the old types of Sweet Peas, the white

scarlet, purple, Painted Lady, and one or two striped varieties were in cultivation in this country for nearly two centuries before any systematic attempt was made to cross them. Even up to the time when Mr. Eckford commenced his great work, the few varieties which had been added to the old ones, viz., Butterfly, Crown Princess of Prussia, Violet Queen, and one or two others, had mainly originated as seedling variations. But once new varieties were obtained, the work of development has gone forward, and up to this time nearly one hundred varieties have been added, some of the American, as well as home production, are characterised by charming tints, which at one time were thought almost impossible in the Sweet Pea, especially tints of yellow, apricot, blue, mauve, salmon, &c. In the white and pink Cupids, we get diminutive types that are distinctly novel and useful. There may be a good deal of sameness of character about some of the newer sorts, but they are all very attractive, and they are in great request for cutting and all decorative purposes. The time has, however, come when only new varieties, characterised by undoubted distinctness of character, should be distributed.

PELARGONIUM.

The Pelargonium will always be grown, but for varying purposes, according to the tastes of the time. In 1837 Mr. Whomes, at that time gardener to E. Foster, Esq., Clewer, near Windsor, with Messrs. Gaines, Beck, Cook, and others, were the leading raisers of seedlings; and a little later, Mr. G. W. Hoyle, of Reading, followed on the same lines; while Ambrose, Gaines, and others were improving the fancy type. Both sections were popular exhibition plants for many years. The spotted section appeared about forty years ago; a number of very fine varieties were raised on the Continent, and gradually the florist's type gave way before the spotted or decorative class, and the varieties are now extensively grown for market and general decorative purposes, as also for exhibition. The charming fancy varieties, so free of bloom, and generally delicate in tint, require special culture, and this operated to restrict their cultivation. The appearance of a variegated-leaved variety in 1848, under the name of Flower of the Day, called attention to this section; Golden Chain, a golden-edged variety, came a little later. About 1857, Mrs. Pollock appeared, followed by many varieties of tricolors, both silver and golden. Meanwhile, the zonal section was also being greatly improved, and the names of Pearson and Cannell will always be associated with some of the best work of this character. During the last thirty years, the Ivy-leaved section has been considerably developed, fine double and single varieties having been obtained, more largely abroad than at home, and they prove of great value for house decoration, bedding and basket purposes.

PETUNIAS.

Except for bedding purposes, the Petunia has ceased to be greatly grown. It is cultivated for market purposes, but the giving of names to varieties has ceased, except in the case of something of special character. Flowers of large size now rule in the place of the smaller and more symmetrical blossoms of a quarter of a century ago. Those who remember Shrubland Pet, and the Countess of Ellesmere, and Annie Salter, of forty years since, can realise how much the flowers have grown in size; but large flowers are generally associated with a coarse habit of growth. [See figs. 159, 160,

and 161, in the *Gardeners' Chronicle* for June 29, 1897.]

PANSIES.

The show or English Pansy, which Thompson, Hale, and others were improving at the time of the accession of the Queen, is still much grown in Scotland and the North of England, and new varieties are being raised annually; but it has practically stood still during the past twenty years. The introduction of the Belgian or fancy varieties by Mr. W. Dean in 1859-60, with their larger and finely-marked flowers and more vigorous growth, was gladly welcomed, and this section is now largely cultivated, almost to the exclusion of the English varieties, and they appear in most gardens. The northern florists have now taken the lead in their cultivation, and raise a considerable number of new varieties annually.

"VIOLA."

The "Viola" has come to the fore of late years, and is now extensively used for bedding purposes. The improvement commenced some forty years ago, *V. lutea* and other species being employed to produce seedlings; then *V. cornuta* and its white variety came prominently into notice as bedding-plants, when the ribbon-borders prevailed in most gardens. A number of raisers took the flower in hand, and there is now an enormous number of varieties which are very valuable in the flower garden; colours, and combinations of colours, unimagined in 1860, have been obtained. The Viola is also employed as an exhibition-subject, being shown in sprays.

CHINESE PRIMROSE.

Those who remember the Chinese Primrose of 1850, and can mentally compare it with the highest productions of the present day, will realise that its improvement has been astonishing. The two sole colours of the former period—the purple and the white—are multiplied tenfold on corollas of large size, substance, and handsomely fringed margins. Even a shade of blue has been developed, and semi-double and double flowers in abundance. It is a most popular subject, largely cultivated for market, and grown for blooming from October until May. But no double variety yet raised has equalled the old double white; and for cutting purposes, this is still an invaluable variety. The hardy and half-hardy species have been reinforced during the past sixty years by the introduction of several, the most notable being *P. denticulata*, *P. Sieboldi* (of which there are now many beautiful varieties), *P. verticillata*, *P. japonica*, *P. obconica* and *P. floribunda*, the three last-named requiring greenhouse culture. [See report of Primula Conference in the *Journal of the Royal Horticultural Society*, vol. vii., No. 2, published June 30, 1886. Also *Gardeners' Chronicle*, January 26, 1889, p. 115; November 15, 1890, p. 564; and January 2, 1892, pp. 12 and 13. Also *Journal of the Royal Horticultural Society*, March, 1891, vol. xiii., p. 99.]

POLYANTHUS.

The old Gold-laced Polyanthus has lost much of its former notoriety, but *P. elatior* is now represented by fancy or giant Polyanthus of great beauty and variety, and they are much employed for spring gardening. The common Primrose has been improved by the raising of varieties of many shades of colour, from white to maroon; and Mr. G. F. Wilson has been instrumental in developing distinct shades of blue. The double Primroses have been added

to, but in nothing that surpasses some of the old types grown for many years, particularly the crimson, yellow, white and lilac.

RHODODENDRON.

The hardy Rhododendron is still a universal favourite; with its improvement may be associated the names of Waterer, Standish, and Noble. Since the Queen ascended the throne marvellous developments have occurred, and the rich spottings found on the upper portions of the corollas of some of the varieties make them doubly attractive.

STREPTOCARPUS.

Wonders have been accomplished with the Streptocarpus. It is remarkable that *S. Rexii* should have been in cultivation so long before the possibilities of improvement in the flower suggested themselves. Once commenced, its improvement went forward by leaps and bounds, and beautiful hybrids were obtained by Mr. Watson and others. Then by crossing these with some of the newly-introduced South African species, further new and distinct forms have resulted, and the range of colour has been greatly extended. The possibilities of further developments appear to be almost unlimited.

TROPÆOLUM, VERBENA, ETC.

The Tropæolum and the Verbena no longer occupy the position of florists' flowers. The dwarf annual types of the former have had several additions made to them, and they are useful summer bedding plants. Those who have known the Verbena since Robinson's Scarlet Defiance made such a stir in 1848, and saw the improvements made by Barker, Smith, Edmonds, Perry, Eckford, and others, may regret that only common forms find a place in our gardens now, but it is no longer regarded for other than bedding purposes. Phlox Drummondii has taken its place, and is now largely employed for bedding purposes.

The Antirrhinum, Pentstemon, Pyrethrum roseum, Pæony, Sweet Pea, summer and winter Stocks, with the Aster, are all popular, greatly improved, and widely grown.

The horticulturist can look back over the sixty years of the Queen's reign and take pride in the survey; and he can look forward with hope and confidence to the future, feeling sure that there is no limit to developments in the vegetable kingdom.

NEW OR NOTEWORTHY PLANTS.

EPIDENDRUM × RADICO-VITELLINUM (RADICANS ♂, VITELLINUM MAJUS ♀), new gard. hybrid.

IN this remarkable hybrid, raised by Messrs. James Veitch & Sons, Ltd., we have another remarkable evidence of the strong individuality of the male parent, as shown in the illustration of their *Epicattleya* × *matutina* in the *Gardeners' Chronicle*, April 10, 1897, p. 233, and which, in a general way, will give a good idea both of the plant under notice and its flowers, apart from the peculiarities here noted.

In *Epidendrum* × *radico-vitellinum*, as in *Epicattleya* × *matutina*, the *Epidendrum radicans* imparted its slender growth, root-bearing stems, and narrow alternate leaves on the offspring, the evidence of the mother-plant being confined to imparting a softer tint of green, and a slightly glaucous hue to the leaves and stems, the latter showing tendency to be slightly enlarged at the nodes. The flowers, which are borne on a perfectly erect stem some 6 inches in length, have slender, ribbed pedicels 1½ inch in length, yellow, tinged with green. The perianth, which is 1½ inch

CATTLEYA MOSSII, VARIETY RAPPARTIANA.

at its greatest width, is bright orange, tinged with scarlet. In the flowers themselves the struggle for the supremacy between the *Eupheidendrum radicans* and the *Encyclium* is strangely evident, and all the more remarkable if the total suppression of the petals, as seen in every flower of the specimen under examination, prove a constant feature. Each flower consists of three lanceolate orange-coloured outer segments more or less keeled at the back, a labellum varying in form from irregularly ovate to unequally and obscurely trilobed, and varying also in the degree of its adhesion to the column. The blade of the lip is orange-scarlet, and it bears in the centre two short and one long-raised plates or keels of yellow colour. Though not at present of great floral beauty, it is highly interesting, and the sequel to its peculiarities may be given by some of the other strange crosses which Messrs. Veitch have approaching maturity. The seeds of this were sown September 18, 1894, plants flowered June 26, 1897, according to Mr. Seden's record. *James O'Brien.*

DIERVILLA SESSILIFOLIA.

THE *Diervillas*, or Bush Honeysuckles, are handsome hardy shrubs, with white, purple, pink, or yellow flowers in axillary or terminal clusters (fig. 3, p. 14). The leaves are opposite, sessile, or petiolate and serrated. The different species are found in Japan, Siberia, Canada, and the United States. The species under notice occurs in the mountains of North Carolina. The flowers are yellow, and numerous produced on short cymes. A number of flowering shoots were exhibited by Messrs. J. Veitch & Sons, Chelsea, at the last meeting of the Royal Horticultural Society at the Drill Hall.

ESCALLONIA LANGLEYENSIS ×.

THIS pretty variety, a cross between *E. macrantha* and *E. Phillipiana*, with small pale rose-coloured flowers (fig. 4), was shown by Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, at the meeting of the Royal Horticultural Society, on June 15 last. In the colour of the flower, and size of the leaves, it is intermediate between the parents; and in the warmer parts of the country, where it would be safe to risk it out of doors, it would afford desirable variety as a flowering shrub for the lawn or shrubbery border. In less warm districts the *Escallonias* should always be afforded the protection of a south or east wall. By the seaside it, like its congeners, would probably do well (see fig. 4, p. 15).

CAMPANULA BALCHINIANA ×.

ONE of the curiosities of the Temple Show was this pretty creeping-plant (fig. 5), which we could scarcely credit was a true *Campanula*. Such it proves to be, nevertheless, as shown by flowers obligingly forwarded to us by Mr. R. Dean. The stems are slender, prostrate, and like the leaves, densely hirsute, with longish, straight white hairs. The leaf-stalks are about 4 cent. (say 1½ inch) long, sulcate, expanding into a roundish, coarsely-toothed limb, the disc of which is green, the edges creamy-white. When quite young, the leaves are of pale violet colour. The flowers are solitary, on long, slender stalks. The ovary, which in *Campanulas* is inferior, outside the flower, and very conspicuous, with the sepals and petals spreading from its upper edge, is in these flowers wholly superior and enclosed within the flower. The sepals are represented by five shortly-stalked green leaves; the corolla is regular, like that of *C. isophylla*, with a short, open tube, expanding into five flat petals. There are five stamens, with imperfect anthers and a style. [In *Vegetable Teratology*, p. 80, this change is recorded as occurring occasionally. Ed.]

Learning that this plant had been raised by an eminent botanist, Mr. William Mitten, we appealed to him for further information, which he has been kind enough to give us, as follows:—

"The variegated *Campanula* grown by Messrs. Balchin & Son was raised by me from seed taken from *C. fragilis* and *C. isophylla alba*; these standing in pots I had endeavoured to intercross, and capsules taken from both supplied the seeds which were sown together. Excepting the two plants with variegated foliage, which are a little

more robust in growth, there was no appearance that *C. isophylla* had any influence on the progeny; there was much variation in the pilosity of the seedlings, but all were blue-flowered, and none different from the ordinary state of *C. fragilis*. I might have applied pollen of *C. turbinata* as well, but there was no trace of that species in the seedlings. No self-sown seedlings have ever occurred to me of *C. isophylla*, which I have only in the white-flowered form; but young plants of *C. fragilis* come up everywhere. I left Messrs. Balchin to put any name to the plant they chose. Not much was anticipated from this random intercrossing, but I may just mention that in taking up the pollen from a matured anther I have found that when a bit of black sealing-wax is drawn out to a blunt point and (when required to pick up pollen) just rubbed over the sleeve, the wax becomes sufficiently electrified that loose pollen is caught up, can be seen, and applied where desired, almost without touching a flower. *William Mitten, Hurstpierpoint, June 4."*

FIG. 5.—*CAMPANULA BALCHINIANA* × (Hort.).

Natural size, showing free, leafy, stalked sepals and superior corolla and ovary. In the diagrammatic section, S = sepal, P = petal; two hypogynous stamens and a superior ovary in section are seen.

BOOK NOTICE.

HOW TO GROW BEGONIAS. By G. A. Farini. (Sampson Low, Marston & Co.)

"THERE are no named varieties of any merit catalogued by any grower which I do not possess and have grown. I also have many novelties which I have produced by carefully hybridising. Therefore, my information is of the latest, and I hope this book will be the most complete in every detail of anything yet published."

After this introduction it would seem as if there was nothing for the critic to do but announce the publication of the book. Reference to the pages of the work is, however, sufficient to induce one to think that the author is too fond of his production to be a trustworthy judge of its merits. The history of what we know as the tuberous *Begonia* is so very interesting, that we naturally turned to the author's chapter on the subject, but only to find it by no means "complete in every detail," and the information that is given far from trustworthy. It is indeed to be regretted that the author did not consult the literature of the subject to greater purpose, and, at least, that he did not avail himself of the papers read before the *Begonia* Conference at Chiswick

and published in the *Journal of the Royal Horticultural Society*, vol. xv., 1893. Had he taken this trouble he would have avoided many errors. The history, the botanical details, and the orthography certainly need very extensive revision. One illustration taken from the chapter on hybridisation will suffice. The reader is there told that the "pollen . . . passes through small ducts to the ova or embryo-seeds in the wing-shaped, fruit-bearing receptacle." A few lines further we are informed that "the pollen throws out spores or rootlets," p. 35. The worst disease is the "fungus cladespora, the same that causes the Potato-rot." These astounding statements are unfortunate, for it leads the reader to doubt the correctness of the author's experiment on p. 35, an experiment which, if we understand it aright, was a very interesting one, though the way in which it is described might well induce mistrust.

Some of these things are not strictly included in the rubric "How to grow *Begonias*," and were it not for the fact that several pages are devoted to them, we might have passed them with the briefest reference.

It is to be hoped that the churlish refusal on the part of a brother grower to afford information as mentioned on p. 13, is not a common experience. Still more is it to be hoped that the allegation of direct falsehood, such as that made on the same page, may not often be justified.

The author is rather discursive, for after giving useful hints on certain points of culture and on diseases, he passes to the subject of a *Begonia* society.

As to the need for a *Begonia* society, opinions will naturally differ. For our own parts, considering the extraordinary results that have been obtained by Mr. Laing and other raisers without the assistance of any society, and the great degree of perfection from a florist's point of view, that has been obtained by private enterprise and skill, we fail to see the slightest necessity—so far as the improvement of the plant is concerned—for any society beyond those we already possess.

The subjects we have named take up about eighty pages, the remaining fifty-five are devoted to a descriptive list of named sorts which will be useful for reference.

The cultural details are of the briefest kind, and they are such as no gardener knowing little of the subject would consider sufficiently instructive, or the amateur, knowing probably still less of this part of the subject, find a trustworthy guide. As a matter of fact, treble the space occupied by an account of the methods of culture is taken up by an account of the effects of London fog on the *Begonia*. The advice given on pp. 19 and 20 is to the purpose as far as it goes, which is not nearly far enough, and the author gives no hint of the usefulness of the common garden frame supplied with mild bottom-heat from fermenting tree-leaves and stable manure, separately or mixed, in starting old tubers, and growing them on for a month or two afterwards.

ORCHID NOTES AND GLEANINGS.

CATTLEYA MOSSIE, var. RAPPARTIANA.

(See Supplementary Illustration.)

THIS is quite unique. At first sight it might be taken to be a form of *C. Reineckiana*, but on inspection, the atmospheric blue that pervades the lip—faint certainly, very faint—commands attention, and lifts up the form to a front-rank position. The fact that the plant, with its three flowers on it, obtained a double first—at the Manchester and North of England's meeting on the 3rd, and at the Royal Botanic, Manchester, on the 4th—under different judges, establishes its reputation. It comes nearest to *C. M. E. Ashworth*, but eclipses that variety completely. It deserves more than mere temporary recognition, and we append the following detailed description: Flower 8 inches across; sepals oblong, bluntly acuminate; petals 4 inches long, 2½ inches wide. The segments are of wonderful substance, and white. With the shade of slate-colour in the lip,

almost doubts their whiteness; but if white paper be placed at their back, and the lip concealed, the albino character becomes evident. Length of lip $3\frac{3}{4}$ inches; width at base of orifice, 2 inches; interior of the tube flushed, and marked with five orange lines. The blade of the lip has the faint ground of slate-colour, or pale atmospheric blue; and the margin, which is prominently gauffered, is clear and distinct white. On the epichilium are radiating flushed lines of pink. The whole limb is full of detail, and is one of the most remarkable *Mossias* that has ever been introduced. It is dedicated to the fortunate possessor, D. B. Rapport, Esq., Promenade, Liscard, Cheshire (Mr. Nicholson, gr.), who obtained it from one of Hugh Low & Co.'s importations, at the price of five shillings! and it was on view during the whole time of the Whitsuntide exhibition. J. Anderson.

MALFORMED DENDROBIUM FLOWERS.

A remarkable aberration occurs in one of our *Dendrobium chrysotoxum*. It has five sepals, three petals, and two lips, and the formation of the flowers differs generally from the type. A petal is substituted in place of the dorsal sepal; the other two petals are placed at a near approach to right angles. Four of the sepals are placed—two on each side—one above and one below the lateral lobes, and the fifth sepal is placed on the under side, overlapping the keel and the inner edges of the claws of the two lips. The lips are quite distinct, and proportionately formed. There are likewise two anthers and two stigmas. There is also a difference in the raceme, as it terminates abruptly in a three-flowered umbel. I may add, that the plant is in a basket, and has borne two racemes to each leading pseudo-bulb six years in succession. This year it has produced twenty-one blooms on each raceme. T. Appleby, Mentmore. [Malformations of the kind noticed by our correspondent, arising from the union of two flowers, are not uncommon, and they may mostly be traced to excessive vigour. Ed.]

CŒLOGYNE MICHOLITZ.

This species is one of robust habit with light green pseudo-bulbs bearing two leaves also of a lightish colour. The inflorescence springs from the apex of the pseudo-bulbs, and is erect with pure white flowers with the exception of a raised dark chocolate-coloured portion of the lip, which has the effect of making the flower look whiter. The plant in the Edinburgh Botanic Garden has been grown in a warm-house, and afforded a good amount of water at all times. R. L. H.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maldenhead.

The Rosary.—My Briar stocks for budding purposes have made a much more satisfactory growth this season than has been the case for several years; and since the recent rains growth has been rapid, rendering the lifting of the rind an easy job. Rose-budding is so simple an operation, and has been described so often, that it is needless to do so here. It may, however, be stated that the buds should be inserted as near as possible to the base of the shoot selected to carry the bud, and not tied in very tightly. Soft cotton forms the best kind of binding material. Beds and borders of Roses should be looked over occasionally, and decaying flowers, and thin or flowerless shoots removed from the plants.

Own Root Roses.—Usually it is advisable to shorten the growths of standard and dwarf Roses after the first flowering, thereby inducing the lower buds to break for the second or autumn blooming; and the operation helps to keep a symmetrically formed head in the case of standard Roses. And of importance is the removal of all weak, blind, flowerless shoots from the interior of the heads of standards, and the main shoots of dwarf. The propagation of Roses from cuttings may now be done with success, and the best of the shoots that have been cut away may be utilised for this purpose. The readiest means of obtaining a good strike is by means of a partially-spent hot-bed on which a frame may be

placed, and if an aspect on the north side of a wall or hedge can be secured, less shading will be required, and the strike will be quicker. Small 60-sized pots, with a bit of rough leaf-mould at the bottom, and filled with sandy loam pressed down firmly, suit admirably for striking Rose cuttings in. The cuttings should be made from shoots having two or three buds, the lower leaf being removed entirely, and the tips only of the remaining leaves, the wood being cut clean through just below a node. Insert one cutting in the middle of each pot—three or four if they are China or monthly Roses, and some silver-sand should be allowed to run in round each cutting. Only a mild warmth is required, and after inserting the cuttings, afford one good application of water, and plunge the pots to the rim in the hot-bed, and keep them close and shaded from bright sunshine. Roots form in about fourteen days, when a little air may be admitted, and in another fortnight the pots will be filled with roots. They should then be repotted into 5-inch pots, and placed in a cold frame, where they may remain till early spring. Roses struck at this season become furnished with several shoots, and the plants produce a fair quantity of blooms the following year.

Pinks.—The flowering season of these plants being almost past, pipings may be struck if an increase of the stock of plants is desirable. Although Pinks strike pretty successfully in a hand-light or cold frame if it is kept close, roots are made quicker if a mild hot-bed be used; on this bed place a layer of sandy soil 3 inches thick, making it smooth, firm, and level, over all putting a thin covering of sharp sand, and cover with frame, cloches, or handlights. Take shoots of 3 inches in length, cut through under a joint, strip off the lower leaves for a space of an inch, cut off the points of the leaves, and the cuttings are ready for insertion. Make holes $1\frac{1}{2}$ to 2 inches apart with a little dibber, and make sure that the bottom of the cuttings touches the bottom of the holes; press the soil firmly around each with the thumb and finger, and give a thorough watering, putting on the cover an hour later. Two of the nicest Pinks are Mrs. Sinkins and Ernest Ladham's, the latter flowering rather late, and both varieties furnish a few useful blooms throughout the autumn; but those who like Pinks will not confine their attention to these two varieties, but will grow the laced, the mule, and other forms, which are all of easy culture.

General Hints on Work.—Evergreens are making unusually strong growth after the rains, and pruning, &c., where branches are encroaching on each other or on the walks and drives, will have to be attended to. For this sort of pruning the parrot-bill shears or the *secateur* are serviceable for removing large shoots, and the knife for small ones. The seed-pods should be removed from hybrid Rhododendrons, and more especially from small plants recently planted. Tender bedding-plants, and especially those used in carpet-beds, should be sprinkled overhead after hot days; and Liliums in borders freely afforded water, especially those growing in shrubbery-borders, where but little rain as a rule reaches them.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Barford, Dorking.

The Odontoglossum-house.—Such plants as *Odontoglossum Rossi*, *O. aspersum*, *O. Humeanum*, *O. Cervantesii*, *O. madrense*, and *O. Galeottiarum*, are commencing growth, but it is not advisable to repot them now, though new compost may be afforded immediately they commence to root afresh. *Mesospinidium vulcanicum*, *M. sanguineum*, and the closely-allied species, *Cochlidia Noetzeliana*, thrive best when suspended close up to the roof-glass in the cool house, but carefully avoid placing them in a line of draught from the top ventilators. Their flowering season is now past, and if necessary they may be repotted, being careful to give good drainage. Peat and sphagnum-moss in equal parts is the best compost, but requires to be pressed moderately firm around the plants. *Anguloa Clowesii*, *A. Ruckeri*, *A. eburneum*, and *A. uniflora* are now sending up strong growths, which will soon commence to emit roots from their base. If repotting be necessary, it should be done at once, using pots of moderate size, which must be well drained to about one half of their depth. The compost should consist of equal parts peat, loam, and sphagnum-moss. Until the plants become re-established they require careful watering, and it is necessary to guard against drip from the roof lodging in the centre of the growth. *Anguloas* grow well in the *Odontoglossum*-house when it is possible to afford them sufficient light; if this be impracticable, put

them in the coolest end of the intermediate-house. During the growing season the leaves are frequently attacked by scale and red-spider, and it is well to sponge them occasionally. *Dendrobium infundibulum* and its variety are two lovely Orchids, but unfortunately they are difficult of culture. One of the greatest mistakes is to grow them in too much heat. The *Odontoglossum* or cool greenhouse is the proper place for them during hot summer weather. At all times both species should be kept moist at the roots.

Deciduous *Calanthes* of the *vestita* section, now growing vigorously, should be afforded abundance of water at the root, and as young roots will push up all over the surface of the soil, it is good practice to top-dress with rough yellow loam. After the roots have seized upon the top-dressing, alternate applications of liquid manure made from cow-dung should alternate with clean water. Do not use the manure-water unless quite clear, or the compost will become sealed to the air; and at the commencement it should be largely diluted. To grow *Calanthes* well, a comparatively high temperature is necessary; but if they are grown amongst stove plants, they should be placed near the roof, and where no drip or water from the syringe will touch them. The *Regnieri* section of *Calanthes* flower in the spring, and the plants are also making their growth, requiring similar treatment to the *vestita* varieties.

Phaius.—The different varieties of *Phaius*, as *P. amabilis*, *P. Blumei*, *P. sasamicus*, *P. Wallichii*, *P. Sanderianus*, *P. grandifolius*, and the hybrids, *P. Cooksoni*, *P. Owenianus*, *P. Owensii*, *P. Marthae*, and *Phaio-Calanthe Arnoldiana*, having begun to grow, may be repotted forthwith, if any of them seem to be in need of fresh compost or larger pots. The plants succeed in a mixture of yellow turfy loam, peat, and chopped sphagnum-moss, a small quantity of coarse silver or river sand, and a handful of finely-broken crocks per plant. Place crocks at the bottom of the pot to a depth of 2 to 3 inches, over these lay sphagnum-moss; place the plant thereon, and fill to a point just below the rim, making all moderately firm. Afford water in small quantities at first—that is, till the roots are fully active, but afterwards they must receive a liberal quantity. The *Phaius* above named require the same kind of treatment as the deciduous *Calanthes* during their season of growth.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Leicestershire.

The Pine-stove.—Early Queen Pines, now ripening fast, will require to be kept rather drier at the root, and the house more abundantly ventilated; and should any fruits show signs of ripening in quantity greater than the requirements of the place, some of them should be removed to a cool vinery, as recommended in an earlier calendar. When fruit is ripening, no more manure-water should be afforded the plants.

Succession Fruitioners should be afforded a steady bottom-heat of 85° to 90°, and when any plant requires water at the root, it should be copiously afforded; and moderately strong manure-water, at a temperature of 95°, may occasionally take the place of clear water. All suckers, excepting one on each plant, should be twisted off, and all the small ones that form round the fruit must be removed as soon as they can be got hold of. Ventilate freely on bright, warm days; close the house or pit early in the afternoon, say 2.30 to 3 o'clock, and maintain aerial moisture by wetting the walls and paths and the surface of the hot-bed between the plants, using for the latter warm water. The plants may be dewed overhead in very hot weather once a day. If the crowns grow freely, and they are likely to be unduly large, the house must be kept less moist, and the use of fire-heat at night somewhat reduced.

Successions.—Plants which early in the season were placed in the fruiting-pots will be, if they were strong plants at the time, about to finish their growth, and, if wanted for early forcing next year, they may soon be brought to a partial rest by being kept a little drier at the root, but not too much so or fruits will be prematurely thrown up. In houses and pits that have had to be shaded during the growth of the plants, shading may now be discontinued in most parts of the country, the foliage being harder and better enabled to bear the sun's rays without burning. Plants which are still in growth should be afforded water at this season twice a week in some cases, and the state of the soil ascertained twice or thrice a week. Suckers should not be kept crowded together, or

drawing of the leaves will occur; nor should they be allowed to get pot-bound, but re-arrange and repot whenever these operations become necessary.

Tomatos.—Any plants in full bearing, if showing signs of exhaustion in a stocking of the growth, &c., should be top-dressed with loam and dung, and afforded liquid-manure at alternate waterings. The top-dressings should be small in quantity, and frequent—i.e., as soon as the roots show on the surface. Rub out side-shoots, unless any are required to cover bare places. Where plants are allowed to grow and spread on trellises, the growth should be kept thin, and the points of the shoots stopped at the first leaf beyond the truss of flowers. Tomato plants grown on this modified extension method afford heavy crops of medium-sized fruit. Plants for winter fruiting should now be placed in their fruiting-pots, and securely staked, plunging the pots out-of-doors in the sunshine. Under this sort of treatment a quantity of fruit will set late in the season that will ripen during the late autumn and winter months.

THE KITCHEN GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

Late Peas.—The latest sowings must now be made of Ne Plus Ultra, or if dwarf-growing varieties are desirable, Sutton's Latest-of-All and Omega. At Highclere these dwarf Peas do not fill their pods well when sown late, although when sown on warmer and lighter soils they may be quite satisfactory. The ground for this sowing should be made firm before sowing. Some seed of an early wrinkled variety, as Early Giant, may likewise be sown at this date, to come into use in advance of the later Marrowfats.

Vegetable-marrows.—These plants, now growing apace, should have the weaker bine thinned-out, and the stronger pegged down to the soil, to prevent a confused growth, and the better to set the blossoms. Those plants in bearing may be copiously afforded liquid-manure. As soon as the Marrows are large enough for table use, remove them from the plant, otherwise a lengthy succession of fruits cannot be expected. The month of September will be early enough to select fruit for ripening.

Mushrooms.—Outdoor Mushroom-beds will generally be more satisfactory at this season than those in an ordinary Mushroom-house, the maggots being an unavoidable pest in these during the summer. A suitable place for an outdoor-bed is one under the shade of trees, or on the north side of a wall. Beds that are becoming exhausted may be improved in bearing by being afforded a liberal supply of weak liquid-manure from the cow-sheds, at a temperature of 75° to 80°; or the bed may be sprinkled with salt, which should be washed into the soil with tepid water.

Leeks.—If the late or main crop of Leeks is not yet planted, no further time should be lost. The soil must be well manured, and the plants set out in deep drills drawn 15 to 18 inches apart, 6 to 9 inches being the distance from plant to plant. As time goes on, the drills may be filled in, which will ensure 8 inches of blanched stem, a length sufficient for ordinary use. Early Leeks in trenches should be liberally supplied with liquid-manure, and earthed-up in good time.

Shallots and Garlic.—Pull up Shallots and Garlic when the tops begin to die off, and lay them out thinly to dry on the ground where they grew, turning them over a few times till dry. If the weather be wet, dry the bulbs in a cool airy shed.

Herbs.—Flavouring herbs being now about to show flower, may be cut in quantity sufficient for requirements, and spread out thinly in an airy shed to dry. Herbs dried in the sun become brittle, and the leaves fall off. All pot-herbs of perennial growth are the better for being cut over at this season, even when not required for drying, the fresh growth that will result being more compact and more useful if required in the green state in the winter months.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

Pot Strawberries.—Runners which have been layered into the fruiting-pots in the manner recommended at p. 400, vol. xxi., having established themselves by this time, may be given alternate waterings of weak liquid-manure and clear water. Pinch out all runners that push from the layered ones as soon as they appear. The plants may be sprinkled overhead on the afternoons of bright days when applying water at the roots. In the course of a few days the pot-plants

should be detached from the parent plants, and be transferred to a position where they will be fully exposed to the sun, affording space enough between the pots to prevent the plants becoming "drawn." Some boards placed on the side of gravel walks in the kitchen-garden will serve very well for the plants to stand upon. Thus placed a free passage from the pots is secured for the water, and the ingress of worms is prevented. The retaining walls of outside Vine-borders are also suitable, or any other having a south or south-west aspect which can be spared for the purpose. Rough rake the surface of the soil over, and then add between 1 and 2 inches thick of sifted coal-ashes. Stand the pots on this in breaths of about nine rows, the plants in each succeeding row standing anglewise to those in the preceding one, leaving a space of from 18 to 24 inches wide between each bed of plants that the whole may be within easy reach. Plants so placed will not require watering at the roots quite so often as plants stood on boards and retaining walls. When the pots are moderately well filled with roots, alternate waterings of diluted liquid-manure may be given, with top-dressings of some good artificial manure, bearing in mind that plants, like animals, enjoy a change of diet. The success expected next spring, in a measure, depends upon the care and treatment which the plants receive during the present and two following months.

PLANTS UNDER GLASS.

By G. H. MAYCOCK, Gardener, Luton Hoo Park, Luton.

Hot-house Plants.—Those plants of *Stephanotis floribunda* which have flowered, should have their growths regulated, and not be permitted to get into a tangle, and be kept as clean as possible. The shoots, if there are many, should be relieved of the weaker ones, which may be spurred back, the longer ones being laid in thinly, doing this at short intervals of time. Mealy-bug is a troublesome pest, which, if it once infest this plant, is seldom got rid of, but it may be checked by a pretty constant use of clean rain-water, and applied with the syringe twice daily. At the present time apply liquid manure liberally, and afford as a top-dressing sheep droppings or decayed cow-dung to the border or tub in which the plants are growing.

Exoras.—These plants should be afforded plenty of warmth, frequent syringing, and abundance of water at the root, shutting up the pit in which they are growing soon after midday. Any plant showing bloom may be removed to another house, where slightly more air may be given it on warm days, and somewhat less water afforded at the root.

Allamandas and Bougainvilleas may be similarly dealt with, except that the latter should be placed in a rather lower temperature when the flowers open.

Gardenias.—The young stock of plants may now be placed in the pots in which they are to blossom, viz., 8-inch ones. When, on turning a newly-potted plant out of its pot, fresh roots are seen to have run through the fresh soil, the quantity of water at the root may be increased, and the plant be well syringed daily. If the pots can be plunged to the rims in some tree leaves, tan, or cocoa-nut fibre, the plants will be much benefited during the hot weather, and the dropping of the flower-buds prevented.

Freesias.—The earliest-ripened bulbs may be shaken out, and the largest of them repotted, to the number of ten in a 5-inch pot. It is advisable to add a few fresh imported bulbs to the stock yearly, and for that purpose orders should be placed with the nurserymen as soon as possible, in order to ensure getting good bulbs.

General Hints.—Sow seed of *Mignonette* in 5-inch pots for winter use, thinning the seedlings when large enough to six in a pot, and cultivating them as advised in earlier Calendars. The best soil for *Mignonette* is a turfy loam of good quality which has been in stock for one year, mixed with one-quarter of its bulk of half-decayed cow-manure and leaf-soil, with some coarse sand, if the loam be stiff. Specimen plants trained as umbrellas afford plenty of bloom in the spring, and the best varieties are those that grow strongly, as *Machet*, *Miles's Spiral*, or *Parson's tree*. For raising this sort of specimen, sow a few seeds in the middle of an 8-inch pot, taking away all of the seedlings excepting the strongest, which, when large enough, secure to a stake of the desired height; rub off every lateral shoot till that height is reached, then pinch out the point and place on the stake a framework of neat stakes and wire, and on this train the shoots till the whole is covered, when the plant may be allowed to bloom, not earlier.

THE APIARY.

By EXPERT.

"Artificial" Increase, or Dividing Colonies (continued from p. 5.)—My second plan is to make one colony from each old one, on the principle of division of bees instead of division of brood, as in the above case. In using this plan, we must have queen cells nearly mature by the time our first colonies are preparing to swarm. Having such cells on hand, I go to a colony preparing to swarm, or one that has its hive full of bees and brood, and move it to one side of the old location, so as to put a new hive in its place. If a hive is not full of brood, and bees do not touch it, it is useless to try to increase the bees till such is the case. I now look over the combs till I find the one having the queen on it, when I place that comb in the new hive. I next give them a frame having some honey in it, and then fill out the hive with empty comb or foundation, when about two-thirds of the bees in the old hive are shaken in front of the new hive, and allowed to run in. After this I arrange the frames in the old hive, putting a division-board in place of the frames taken out, when the old hive is carried to a new location where I wish it to remain. After the bees thus removed have become reconciled to their queenless condition, I give them one of their nearly-matured cells, or a virgin queen, which will soon be laying. In this way I have secured my new swarm, controlled all after swarming, and introduced my young queen, all to my liking, and with but little trouble.

My third plan is one which I use on the weaker colonies, or those which do not get ready to swarm up to ten days or so before the honey-harvest arrives, when I proceed to make colonies from them, as follows: A hive is filled with frames of empty comb, and placed upon the stand of one of these colonies which have not swarmed, and all the sections are taken off and placed thereon; then all the bees are shaken and brushed off their combs of brood and honey in front of the hive, into which they will run as fast as shaken off. Thus I have a colony that is ready for the honey-harvest, as they have the queen-bees and partly-filled sections all in readiness to work. Previous to this, nuclei have been started, so I have plenty of laying-queens to use as I need them. I next take all the combs of brood from which the bees were brushed, except one, arranging them in the hive the bees were shaken out of, and carry them to the stand of another colony which has swarmed. I next take the comb of brood which was left out, go to one of the nuclei, take out the frame having the laying-queen on it, and put the frame of brood in its place. I take the frame—bees, queen and all—and set it in the place left vacant for it when arranging the combs of brood. I now put on the sections, and having all complete, I move the colony to a new stand, and set the prepared hive in its place. Thus I have a laying-queen, and enough of her own bees to protect her, together with a hive filled with combs of brood, and all the field-bees from the removed colony. The loss of bees to the removed colony stops the swarming impulse, and in about a week they have so regained their loss that they are ready for the sections again. In this way I make one colony from two old ones, but have all in the best possible condition to take advantage of the honey-harvest, which is soon upon us. These plans look toward a host of bees in time for the harvest, with no desire to swarm; and thus, having them gives an assurance of a large crop of honey.

VARIORUM.

CARROTS.—"The root (Carrot) was formerly, cooked in this country in a greater variety of ways than at present, and the leaves of the plant also were used as 'greens.' Between forty and fifty years ago, when the Royal Western Yacht Club at Plymouth had their club-house in Milbay, it was famous for a sweet-savoured carrot-pudding made by their cook. . . . She boiled the roots with the tops, then pressed them through a sieve, and, adding a little syrup of angelica, together with some stiffening, such as isinglass, set the dainty dish to bake. The almost metaphysical subtleties of its simple quality were the very ecstasy of taste. She also confectioned of less transcendental dulcitude a soft (*glace*) candy of the chopped root, most toothsome morsels." *Sir George Birdwood in Mem. on the Purchase in Europe of Carrot Seed*, &c., 1896.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	JULY 10	Rose Show in the Botanic Gardens, Manchester. Royal Botanic Society, Meeting.
TUESDAY,	JULY 13	Wolverhampton Horticultural Show and Fête (3 days). Royal Horticultural Society's Committees.
THURSDAY,	JULY 15	National Rose Society's Show at Norwich. Helensburgh Horticultural and Rose Show.

SALES.

FRIDAY,	JULY 16	Imported and Established Orchids, at Protheroe & Morris' Rooms.
---------	---------	---

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three years, at Chiswick.—63° 4'.

ACTUAL TEMPERATURES:—

LONDON.—July 7: Max., 68°; Min., 54°.

PROVINCES.—July 7 (6 P.M.): Max., 60°, at York; Min., 45°, at Sumburgh Head.

VICTORIA MEDAL OF HONOR.

WE are requested by the Council of the Royal Horticultural Society to give publication to the following list of the sixty gentlemen selected to receive this distinction. The honour thus conferred on eminent horticulturists of various classes in connection with the sixtieth anniversary of the Queen's reign has the distinct sanction and approval of Her Majesty:—

Baker, J. G.	Maries, C.
Balfour, Professor.	McIndoe, James.
Barr, P.	Milner, H. E.
Barron, A. F.	Molyneux, Edwin.
Beale, E. J.	Monro, G.
Boxall, Wm.	Moore, F. W.
Bull, W.	Morris, Dr.
Bunyard, G.	Nicholson, G.
Burbidge, F. W.	O'Brien, J.
Crump, W.	Paul, G.
Dean of Rochester,	Paul, W.
The Very Rev. the	Rivers, T. F.
Dean, R.	Rothschild, The Hon.
Dickson, G., Chester.	Walter.
D'Ombra, Rev. H. H.	Sander, F.
Druery, C. T.	Schroder, Baron.
Dunn, Malcolm.	Seden, J.
Ellacombe, Rev. Canon.	Sherwood, N.
Elwes, H. J.	Smith, J. (of Mentmore).
Foster, Professor M.	Smith, Martin R.
Fraser, J. (Woodford).	Speed, H.
Gordon, G.	Sutton, Arthur.
Heal, J.	Thomas, Owen.
Henslow, Rev. Professor.	Thompson, W., Ipswich
Herbst, H.	Thomson, D., Drumlanrig.
Hooker, Sir J. D.	Turner, H.
Horner, Rev. F.	Willmott, Miss.
Hudson, J.	Wilson, G. F.
Jekyll, Miss.	Wolley-Dod, Rev. C.
Kay, Peter.	Wright, J.
Laing, John.	Wythes, G.

The prevailing feeling, we imagine, on scanning the above list will be, that the omissions are more remarkable than the entries. It would be invidious now to allude to particular individuals whose services to horticulture are at least as great as those of many who are honoured as bearers of the "V. M. H." We may be allowed to point out that there are good reasons for these omissions. The Council, as we have reason to know, took counsel with a large number of horticulturists in all parts of the kingdom, with a view to secure perfect

representation and absolute impartiality, and their task must have been one of the utmost difficulty and delicacy. The members of the Council, very properly, as we think, decided that no member of their own body should be selected, and many others not officially connected with the Society, have, for various reasons, been unwilling to accept the proffered honour.

Some of the members of the Council may, on retirement, and on the occurrence of a vacancy in the list of sixty, be elected, and thus the apparent defects may in time be removed. In any case, we think the President should have headed the list as "Grand Master" of the Order; and we venture to suggest that for public, as well as personal reasons, Sir TREVOR LAWRENCE be a medallist *de jure*.

It is to be hoped that those gentlemen connected with the horticultural trade who have been selected to bear the honour will not besmirch it by using it for advertising purposes.

We think the Society deserves the gratitude of the horticultural community for this effort to confer honour on its eminent representatives.

ONCE again has been held the annual metropolitan exhibition of the National Rose Society at the Crystal Palace, and a most satisfactory one it has been. The disappointment rosarians experienced recently at Portsmouth has quickly been superseded by natural jubilation in the presence of one of the best displays of Roses that has been seen at the Palace, at any rate during recent years. It is satisfactory to know that in 1897, when anything that can be construed into "national" is unusually popular, and the means of exciting much enthusiasm, the most important display of the national flower has been one equal to the occasion. In all its sections, so different from each other, in charming variety of form, and colour, and habit, the Rose was seen on the 2nd instant as near to perfection as is possible at any one time or place.

It is quite evident that in the ripper years of the Victorian Era the Rose is increasingly popular, and a commoner garden plant than it has ever been, and this in spite of the fact that there is no institution known as Rose-day, or other fanciful means of glorifying the flower. The Rose is popular because of its exquisite form, its beautiful colours, and delicious fragrance. It is admired, not because it is known as the national flower; on the contrary, it has attained this distinction owing to the universal admiration it commands, and will retain, whether or not special efforts are made to surround the flower with the species of sentiment that exists in Ireland in relation to the Shamrock; or even in the improbable event of its ceasing to be the idol of a special society, much as this society has done to develop certain characteristics in the flower. It will be seen from a letter in our present issue, for which we are obliged to our courteous correspondent, Mr. ED. MAWLEY, that the number of exhibition blooms staged at the Palace was 7200, being 1450 more than the average for the past five years, and 100 more than at the large exhibition in 1892.

We were not surprised to find that there were no Scotch Roses shown on this occasion, as they could hardly be expected to be in condition at this date in the present season, which is naturally rather late, and which a few weeks ago promised to be much later than it really is. As it happened, the date fixed for the metropolitan show proved to be the most fortunate that

could have been arranged, just as the show at Portsmouth was an unfortunate one, because it was too early for obtaining a good exhibition. At the Palace there were Roses from Ireland, England, and Wales, and ED. MAWLEY has further divided the exhibits into the various counties. Messrs. HARKNESS SONS, of Bedale, Yorkshire, had the best exhibit of seventy-two blooms in the mixed class, and thus beat the Colchester, Chesham, and Irish growers; but Messrs. HARKNESS have now land at Hitchin, and it may be that the fact explains the circumstance that this northern firm was successful over southern exhibitors in a moderately late season. The severe frost that devastated a large part of Essex should also be borne in mind. In any case the Roses staged by Messrs. HARKNESS were Roses to be proud of, many of the blooms in the standard being faultless. In the Tea and Noisette divisions Messrs. FRANK CANT & Co. of Colchester took the leading prize with a better collection of blooms than has been seen at the Palace for some years. They were remarkably free from damaged petals; the size and form of the flowers were better, and they had more substance. These satisfactory qualities were just as observable in the amateurs' classes—indeed it was remarked many times, that the high character of these exhibits was a feature of the show. The Trophy and Replica for the principal mixed class was won by that excellent Rose grower, E. B. LINDSELL, Esq., and the equal important class for Teas and Noisettes by O. C. ORPEN, Esq. In each of these cases, Mr. C. GRAHAME was a near competitor.

The garden varieties made a brave display, but the competition was not so extensive as in some other classes. In Messrs. PAUL & SON'S exhibit, we noticed a bunch of a new, large semi-double variety, named Dawn, that appeared to be more than equal to any other in the collection in point of showiness and beauty.

The Medal Roses in every instance were worthy of the distinguished award. Last year it was indeed difficult for the judges to fix blooms that they could conscientiously award them to, but the very reverse was the case on this occasion. The names of them will be found in our report, and we will but mention here the grand bloom of the new Rose Muriel Grahame, awarded the Medal among amateurs as being the best bloom of a Tea and Noisette, and exhibited by Mr. LINDSELL.

New Roses were very conspicuous throughout the exhibition. Two of the four medals were awarded to new varieties; and in the special classes for novelties the number of exhibits was unusual, and the Society's Gold Medal was awarded in one instance. Some of the new Hybrid Teas were especially remarkable in many of the first-prize collections, notably Marquis de Litta, a French Rose of peculiarly rich colouring, and Kaiserin Augusta Victoria.

Altogether, the exhibition was a magnificent one, and the weather, though fair, being dull, the blooms remained fresh throughout the day and visitors were able at any hour to carefully inspect and admire the exhibits.

ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral Meeting of the Royal Horticultural Society will be held on Tuesday, July 13, in the Drill Hall, James Street, Victoria Street, Westminster, 1 to 5 P.M. A lecture on "Mutual Accommodation between Plant Organs," will be given by the Rev. Professor GEO. HENSLAW, M.A., F.L.S., at 3 o'clock.

UNIVERSITY COLLEGE CONVERSAZIONE.—The grounds and buildings of the college in Gower Street

presented a very gay appearance on the occasion of the annual conversazione held on the evening of the 30th ult. The whole of the scientific and other departments were thrown open, and numerous exhibits and experiments were on show for the entertainment of the guests. In connection with the botanical department numerous exhibits of plants had been arranged. Messrs. Wm. PAUL & SON, of Waltham Cross, had a splendid collection of pot and cut Roses in the south cloister; whilst Messrs. VEITCH of Chelsea, and Messrs. H. CANNELL & SONS, of Swanley, were well represented in the spacious anatomical museum—the former by *Nepenthes* and other carnivorous plants, *Orchids*, &c., the latter by *Begonias* and *Cannas*. Here also was a representative collection—kindly lent by CLAUDE BEDDINGTON, Esq., of dwarf Japanese trees, including *Conifers*, *Acers*, *Prunus*, &c. This attracted much attention, many of the little plants, not over 1 foot high, being quite a hundred years old. Sea-weeds and fresh-water plants were shown as transparencies by the electric light, and were very effective. In the botanical laboratory, besides other objects of interest, there was an admirable exhibit of herbaceous plants by Mr. THOMAS WARE, of Tottenham, while banks of flowers in the window-bays testified to the artistic capacity of the lady students of the department. We cannot close this notice without allusion to the decorations in the Slade School. Here the staircases and corridors were a scene of splendour. Ropes of Roses festooned the balustrades and balconies, and twined around the columns. On slabs and tables lay, in appropriate colours, quaint conventional patterns in cut flowers—altogether a very notable artistic success in floral decoration.

NATIONAL CARNATION AND PICOTEE SOCIETY (Southern Section).—The annual show of the above will be held at the Royal Botanical Gardens, Regent's Park, on Wednesday, July 21. On this occasion, the Royal Botanic Society offer two Silver instead of two Bronze Medals as previously announced; and in addition to the money prizes offered, a Silver Medal will be awarded to the best exhibit in class 1, twenty-four Carnation blooms, Bizarres and Flakes only, not fewer than twelve dissimilar varieties. And a Silver Medal for the best exhibit in class 5, twelve Carnation blooms, selfs only, dissimilar varieties. MARTIN R. SMITH, Esq., president of the society, will preside at the luncheon provided in the gardens.

ENORMOUS STRAWBERRY CROP.—In some parts of Kent this year the crop of Strawberries is quite phenomenal. From Sandwich alone during the last seven days over 100 tons of this luscious fruit have been despatched. In one day the consignments exceeded 30 tons, requiring special goods trains to convey them to London. Large quantities, however, go beyond London to the great centres in the Midlands and North, the average price being 1s. per gallon. There is now a very considerable acreage under Strawberry cultivation in Kent. *Westminster Gazette*.

LONDON WEATHER.—At the meeting of the Royal Meteorological Society, on June 16, a paper, by Mr. R. C. MOSSMAN, on the non-instrumental meteorology of London, 1713–1896, was read by the Secretary. The author has gone through the principal meteorological registers and weather records kept in the metropolis, and in this paper discusses for a period of 167 years the notices of thunderstorms, lightning without thunder, fog, snow, hail, and gales. The average number of thunder-storms is 9.7 per annum, the maximum occurring in July, and the minimum in February. The average number of fogs is 24.4, and of "dense" fogs 5.8 per annum. The decadal means show that there has been a steady and uninterrupted increase of fog since 1841. The average number of days with snow is 13.6 per annum. The snowiest winter was that of 1887–8, with forty-three days, while in the winter of 1862–3 there was not a single instance of a snowfall. The mean date of first snowfall is November 9, and of the last snowfall March 30. Hail is essentially a spring phenomenon,

reaching a maximum in March and April; the minimum is in July and August. The average number of days with hail is 5.9 per annum. *Nature*, July 1.

CRIMSON RAMBLER ROSE.—Mr. FRASER of Lea Bridge obligingly sends us a sporting branch of *Crimson Rambler*. The shoot bears two trusses of bloom. The flower-stalks in the one are relatively short, and the flowers of the usual crimson colour; whilst, in the other truss, the peduncles are twice the length of those on the normal branch, and the flowers are smaller and white as in *Rosa polyantha*. The stalked glands are alike on both branches. This may throw some light on the origin of this popular Rose.

KEW GARDENS FLAGSTAFF.—For the first time in the history of the fine flagstaff at Kew Gardens a flag was hoisted during the Jubilee week. The Government, it is said, gave a magnificent Royal Standard, valued at £70, for the purpose.

ANCIENT SOCIETY OF YORK FLORISTS.—The third of the series of minor shows held under the auspices of this society during the summer months took place on Wednesday, June 30, in the Guildhall, when there was a meritorious collection of flowers and a few plants. Cut-flowers formed the principal attraction, and included a very excellent show of *Roses*. Mr. J. W. HUTCHINSON, Kirbymoorside, was a prominent exhibitor in all the classes, and practically carried all before him. *Pinks*, the finer varieties of which appear to be going somewhat out of cultivation, were a moderate collection, but the hardy herbaceous perennial flowers made a brave show. Some very fine *Pansies* were staged, and there was the usual display of buttonholes, bouquets, &c. In the plant section there was a very pleasing exhibit of exotic and British Ferns.

JUBILEE OUTINGS.—Messrs. CHARLES SHARPE & Co., Limited, seed merchants, Sleaford, treated their workpeople to a most enjoyable day's outing on Saturday, July 3. About 200 of the women employed at the Sleaford, Ruskington, and Heckington warehouses were taken by special train to Skegness. A substantial dinner and tea were provided, and the weather being beautifully fine, nothing was wanting to make the trip a great success. On the same day forty of the clerks and male employees were treated to the Royal Agricultural Show, at Manchester, and thoroughly enjoyed the outing.

A NEW PUBLIC PARK FOR GLASGOW.—Many and varied as have been the municipal enterprises of Glasgow in recent years, none has been more remarkable than the movement for extending the public parks and open spaces of the city. Until a few years ago it was deficient in that respect, but under Sir JAMES BELL's régime an immense development took place, and during the last six years the number of the public parks of Glasgow has been more than doubled. Hitherto it has been a common complaint that the Corporation has favoured the well-to-do West End and other suburbs, and neglected the toiling thousands of the industrial East End in regard to open spaces. An important step in removing any ground for that reproach was taken on Saturday, 19th ult., when Lord Provost RICHMOND threw Tollcross Park open to the public. This consists of the grounds, extending to about 84 acres, surrounding the mansion of Tollcross, long occupied by the Dunlop family, which for two centuries has been so closely associated with the commercial development of Glasgow. When Mr. JAMES DUNLOP died two years ago, a feuing plan was suggested to meet the ever-growing demand for houses in the district; but the Corporation stepped in, and for £30,000 purchased one of the most picturesque spots in the neighbourhood of Glasgow for the use of the public. Situated three miles from the Cross, the park is just beyond the eastern boundary of the city, within a short distance of the villages of Tollcross and Shettleston, and is bounded on one side by the high road to Edinburgh. Lord Provost RICHMOND performed the opening ceremony in the course of his tour round the public parks, where the children's fêtes were in progress. *From "Edinburgh Evening Dispatch."*

INCARVILLEA DELAVAYI.—The flowering of this beautiful hardy *Bignoniad* is mentioned in a note on Prof. FOSTER's garden at p. 427 of the last volume. It may be interesting to record that a Scottish correspondent has obligingly sent us flowers from Munches in Perthshire, N.B.

THE GARDENERS' COMPANY.—At a meeting of the Court of the Gardeners' Company, held at Vintners' Hall, Upper Thames Street, on Tuesday, Mr. N. SHERWOOD was installed as Master, and Sir WILLIAM FARMER and Mr. PHILIP CROWLEY as Wardens, of the guild for the second year in succession. The ceremony was followed by the "Master's installation banquet," at which the Master, who presided, was supported by, amongst others, Mr. R. J. SEDDON, Premier of New Zealand. Lord AMHERST proposed the toast of "The Colonies." Mr. R. J. SEDDON responded. He represented, he said, "the Garden of England," and he felt that an injustice had been done to New Zealand and the other colonies by their Prime Ministers having been invited within the last forty-eight hours to visit Ireland "in native costume." Colonists, he proceeded, were proud of their connection with the mother country, and throughout all their many privations they had never had the slightest desire to sever that connection. But he was in the habit of speaking plainly, and he desired to say that the Prime Ministers of the colonies had found, during their present visit to the mother country, that they were more in touch with the people of the mother country than they had been with its rulers. They warmly appreciated the reception they had had from the people, and the earnest desire which had been manifested to welcome them and to promote their welfare and happiness.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meeting of this Society on June 12 last, the Floral Committee awarded First-class Certificates to *Anemone coronaria* fl. pl. *The Bride*, shown by Messrs. E. H. KRELAGER & SON, Haarlem; to *Pteris Wimsetti*, shown by Mr. H. J. LEMKES, Jr., Alfen a/R; to *Rosa hybr.* *Thea Souvenir du President Carnot*, R. h. T. *Souvenir de Madame Eugène Verdier*, and R. h. T. *Fiamette Nabonnand*, shown by Mr. JAC. SMITS, Naarden. Certificates of Merit were awarded to Messrs. J. STRAVERS & SON of Willige, Langerak, for *Pelargonium zonale Hortulanus Budde*; and Messrs. E. H. KRELAGER & SON, for *Tropaeolum Leichtlini*.

THE NATIONAL AMATEUR GARDENERS' ASSOCIATION held an exhibition and garden party in the grounds of the Royal Botanic Society in Regent's Park on Saturday, the 3rd inst. Mr. R. G. DOUGALL, of Walthamstow, secured the prize for the "Pye" championship for *Violas*; Messrs. JNO. LAING & SONS, Forest Hill, made a display with *Begonias*; Messrs. CANNELL & SONS, Swanley, and Mr. H. J. JONES, of Lewisham, had also meritorious exhibits.

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT ASSOCIATION.—The monthly meeting of the above association was held at Shanklin, on Saturday, July 3. Dr. J. GROVES, B.A., presiding; and a paper was read on the "Cultivation of *Gloxinias*" by Mr. N. JOLLIFFE of Woodside Gardens, Wootton. The exhibits, which were many and meritorious, included *Streptocarpus*, *Roses*, *Shirley Poppies*, *Cannas*, and *Violas*. Arrangements were made for an excursion to Brooke House, the residence of Sir CHARLES SEELY, president of the association, on July 14. The next meeting will be held at Ventnor, when Mr. C. ORCHARD will read a paper on the "Progress of Horticulture in England in the last sixty years."

IMPORTATION OF PLANTS TO THE CAPE.

IN reply to a correspondent, we publish, through the courtesy of the Cape Government Agency the following regulations at present in force at the Cape of Good Hope in virtue of a Proclamation by Sir Hercules Robinson, Bart., Governor of the Colony, dated March 25, 1896, as follows. It will be seen that considerable relaxation has taken place in the regulations affecting the introduction of plants other than Vines.

IMPORT REGULATIONS.

"I. The importation into this Colony from places beyond the boundaries thereof, of all Grape Vines or cuttings or portions of Grape Vines, is absolutely prohibited, with the exception of Vines or portions thereof, imported by the Government of this Colony under such precautionary measures as it may decide to be necessary.

II. All trees and plants other than Vines, and all parts thereof, and all fruits of any description, and all tubers, roots, bulbs, or portions thereof, and all packages, cases, pots, or coverings whatsoever containing such, shall, before being introduced into this colony from places beyond the boundaries thereof, undergo a strict examination by a competent officer appointed for that purpose, to determine as far as possible the absence of noxious insects and plant diseases which it would be prejudicial to this colony to allow to be introduced; and it shall be the duty of the consignee to open all such packages, cases, or coverings, for the purpose of the examination aforesaid, and to afford every facility to the said examining officer during his examination.

III. On the aforesaid officer being satisfied as to the absence of noxious insects and plant diseases in such trees, plants, fruits, tubers, roots, bulbs, or portions thereof, and their packages, cases, pots, or coverings, he shall give a certificate to that effect to the consignee; and without such certificate no such articles shall be landed.

IV. All trees, plants, fruits, tubers, roots, bulbs, or portion thereof, or the packages, cases, pots, or coverings in which they may be packed, which shall be found to be infected with any noxious insect or plant disease, shall be cleansed or disinfected by the consignee in the manner prescribed by and to the satisfaction of the examining officer; and if not so cleansed or disinfected, or if such disinfection shall be deemed or found to be ineffectual, shall be immediately destroyed.

V. The importation or introduction of any stone-fruit tree, or any fruit, scion, cutting, graft, root or seed, the growth or produce thereof, from the United States of America or the Dominion of Canada, is hereby absolutely prohibited, and anyone importing or introducing such fruit tree, or other article the growth or produce thereof, as aforesaid, shall, upon conviction, be subject to the penalty provided in the body of this Proclamation; and in addition thereto, the fruit tree or other article imported shall forthwith be destroyed.

VI. Save as in the preceding clause mentioned, all stone-fruit trees, or other articles, the growth or produce thereof, may be imported and introduced into this Colony, subject to the provisions laid down in Clauses 2, 3, and 4, preceding, provided that such consignment of trees or other article be accompanied by a sworn declaration from the consignor that the articles proposed to be imported were not grown in the United States of America or in the Dominion of Canada, and without such declaration no such articles shall be imported.

VII. On the examining officer being satisfied as to the sufficiency of the declaration in section VI. above mentioned, he shall give a certificate to that effect to the consignee; and without such certificate no such articles shall be imported.

VIII. The Government does not hold itself responsible for any loss or damage that may result from the destruction of the articles under the provisions of these regulations, or from any process that may be considered necessary to cleanse or disinfect the articles or to discover the existence or otherwise of any noxious insect or plant disease.

IX. These regulations shall not apply to canned or preserved fruits."

KEW NOTES.

CAMOENSIA MAXIMA.—The Kew plant of this fine African Leguminous plant is again flowering. I suggested last year that probably age was the principal factor in the flowering of this plant, and that it would most likely flower annually now that it had reached what we may call maturity.

HIBISCUS ARCHERI.

This is a hybrid between *H. rosa-sinensis* and *H. schizopetalus*, which originated in the West Indies, from whence it was sent to Kew, where it flowers all through the summer in the porch of the Water Lily-house, along with a selection of forms of *Hibiscus*. It has the habit of *H. rosa-sinensis*, and the form of flower of *H. schizopetalus*; but in size, the flowers are about three times as large, and they are coloured bright crimson. I am informed by Mr. Hart, of Trinidad, that this hybrid is a well-known garden plant in the West Indies, but I never saw it in England before last year, when it flowered at Kew for the first time. It is named in compliment to Mr. A. S. Archer, of Antigua, who sent it to Kew.

KALANCHOE FLAMEA (Stapf).

This is a new species, of which a description will shortly be published in the *Kew Bulletin*. It is a beautiful greenhouse plant, quite distinct from all other *Kalanchoes* in the size and colour of its flowers, whilst in habit it is all that the market grower could desire. The stems are erect, a foot high, each bearing about ten pairs of fleshy-green spatulate leaves, 2 to 3 inches long, and a terminal erect flower-stalk 6 to 9 inches long, bearing a compound umbel 5 inches across, composed of crowded four-petalled spreading flowers $\frac{3}{4}$ -inch wide, and of the richest orange-scarlet colour. In effect the flower-heads are intermediate between *Crassula coccinea* and *Bouvardia President Cleveland*. It has been in flower in the Cape-house at Kew for over four weeks, and it will last several weeks longer. For its introduction we are indebted to Miss Edith Cole, who collected seeds of it in Somaliland, and sent them to Kew in 1895.

CALOCHORTUSES.

A collection of these has been and still is an attraction in a narrow, sheltered border on the south side of the T Range at Kew. They were planted in November, and until April the rain was kept off them by means of lights. They commenced to flower about the middle of May, and they are likely to go on flowering for some weeks yet. Some of them are small in flower, and would be considered weedy by many cultivators, but the following are large and handsome, and quite as worthy of cultivation as the best of Tulips: *C. clavatus*, flowers nearly 3 inches across, the segments forming an elegant cup coloured rich citron-yellow, with a faint zone of brown at the base and a lining of yellow hairs; *C. Vesta* has flowers as large as those of *C. clavatus*, white, with feather-like markings of maroon inside; *C. macrocarpus* is the giant of the genus, the stems being nearly 2 feet long, the flowers 4 inches across, the three outer segments long and narrow, the three inner very broad; the colour is a rich mauve, paler in the throat, where there are numerous yellow hairs; *C. venustus* has elegant cup-shaped flowers, 2 inches across, white, tinted with mauve and blotched inside with purple-brown; the variety *oculatus* is white with yellow throat, mottled and blotched with dark brown; and the variety *venustus* is citron-yellow, with three eye-like blotches of maroon. W. W.

SCOTLAND.

NOTES FROM ROYAL BOTANIC GARDEN, EDINBURGH.

SAXIFRAGA LINGULATA.—Plants of this showy species are grown here in pots for the purpose of greenhouse decoration, and when in flower form quite a pretty group, the lightness of their inflorescences lending themselves well for use in this way. The stems rise about a foot above the glaucous, serrated rosette of leaves, and bear many flowers with white petals bearing numerous dots of red at their base.

Another plant resembling the previous one is *S. Macnabiana*, raised in these gardens from seeds of *S. pyramidalis*, supposed to be crossed with *S. lingulata* or *S. Hostii*. In habit and colour it is like the first-named, and is a desirable greenhouse or frame plant.

HIBBERTIA VOLUBILIS.

This is undoubtedly the finest of these free-growing plants, and bears the largest flowers of the genus. If planted out in a fairly rich, sandy soil against a wall in a greenhouse, it quickly throws up its long twining branches, from which short secondary branches are given off, bearing at their apex the large bright yellow blooms, 2 inches in diameter. This method of growth shows off to better advantage the flowers than that of growing upon the roof, as the foliage in this position forms a better background. *H. dentata* is also a good climber, but far less showy. They are both now in flower here, and will continue in bloom for some time longer.

OXALIS VARIABILIS RUBRA AND ALBIFLORA.

For greenhouse decoration these plants are among the best of this large genus, and as an edging to a stage or bed are extremely showy and attractive. They are of low growth, the green foliage of three leaflets being borne upon short petioles about 2 inches long. Above this bed of green the single flowers are raised. The flowers are about an inch in diameter, of a rosy colour, with a yellow throat. Grown together, they form a pretty patch of colour during their flowering, and in this respect they are most profuse, some sixteen to twenty flowers being counted on 4-inch pots. R. L. H.

COLONIAL NOTES.

BATS FERTILISING FLOWERS.

A RECENT *Bulletin of Miscellaneous Information*, from the Royal Botanic Gardens, Trinidad, contains the following note about bats fertilising the flowers of *Bauhinia megalandra*, a species indigenous to Trinidad. This plant grows to as much as 30 or 40 feet in height, and forms a stem of large size. Its flowers are large, white, and their anthesis takes place in the evening hours only, from about 4 to 6 o'clock, darkness setting in with us at the latter hour at this season of the year (January). For about half-an-hour before darkness sets in, various species of bats (*Cheiroptera*) can be seen rapidly visiting flower after flower, and as they leave, portions of the white petals can be seen to fall to the ground. An examination of the tree on the following morning will show that not a single perfect flower remains, all being more or less ragged, torn, and deprived of their large white stamens and petals. The bats on visiting a flower alight upon and hold fast to the protruded stamens, and appear to attack the erect and recurved petals, as these are completely scratched or broken to pieces, and sometimes torn quite away from the flower. Sometimes the stamens also are broken short off at their base, but the stigma seldom appears to be injured. There does not appear to be any nectar secreted by the flower which it is possible for the animals to obtain, and it is therefore probable that they visit the flower for the purpose of securing the insects that are attracted thereto by the odour it exhales, and to effect this purpose, place themselves in such a position as to bring the stamens of the flower into contact with the stigma, and secure the fertilisation of the flower.

PRUNUS JACQUEMONTI.

THE much more extended limits given to the genus *Prunus* in the later and now generally accepted classifications make it a very large one, and of its various groups none is more charming than that which includes the dwarf Cherries. To this section belongs the species now shown (fig. 6). It is one of the latest to be introduced, seeds of it having been sent to Kew by Dr. Aitchison less than twenty years ago. They were collected in the Kurrum Valley, and from them the first cultivated plants were raised. The largest, and the one from which the flowering branch now figured was obtained, is now about 7 feet high, and nearly as much through—a rounded bush, sweeping

the ground with its lower branches. It is a native of Thibet, Afghanistan, and the north west Himalaya, at elevations of 6000 to 12000 feet; it is perfectly hardy in most parts of this country.

The leaves are ovate, toothed, $1\frac{1}{2}$ to 2 inches long, and covered with short hairs when young. The flowers are very like those of the dwarf Almond (*Prunus*—or *Amygdalus*—*nana*), being half an inch in diameter, and of a bright rosy-pink. It is at its

Jacquemonti. The chief botanical distinctions between the two are to be found in the stipules and in the lobes of the calyx. In *P. Jacquemonti* the stipules are lacinate, in *P. humilis* they are ciliate and glandular; in *P. Jacquemonti* the calyx lobes are pointed and reflexed, in *P. humilis* they are blunt, erect, and twice the proportionate length. Both may be planted singly or in groups, towards the front of the shrubbery. *W. J. B.*

FIG. 6.—*PRUNUS JACQUEMONTI*. (SEE P. 22.)

best about the middle of April, and its beauty and the great profusion of its blossoms at that time will recommend it to all lovers of hardy trees and shrubs. A species closely allied to this is *P. humilis*, so closely, indeed, that the two may easily be confused. *P. humilis*, however, is Chinese, and in my experience not so free-growing and beautiful a shrub as *P.*

the north side of the Campsie range of hills, and at an altitude of over 600 feet above sea-level, being a cold one; and I asked Mr. Taylor, the gardener, what were his methods of growing Cauliflowers to obtain them so early? The variety he said that I saw was Early Snowball, and the seed was sown in the open air last August, and after the plants were large enough for handling, they were pricked into a cold frame, where they were protected from frost during the winter. About the first or second week in January they were put into pots, and taken into a vinery just about to be started, where they were kept as near the light as possible. After the roof became covered with the foliage of the Vines, they were shifted into cooler quarters, and gradually hardened-off. As the plants were then of large size, they had to be carefully handled when planting them out in the first week in April on a border in front of a range of glasshouses, in a sort of double line, quite close to the glasshouse. At night they were covered with light material, conveniently arranged, to ward off frost. By the end of the month of May the first of them were ready for cutting, and the crop off the ground before the end of last month. This method has something in it to commend itself to gardeners in general, because most of them have the accommodation above mentioned, and by using Methven's June Broccoli, they would have a continuous supply without the necessity of growing their first crop under glass. *D. L. M.*

PEARS.—Surely "H. H. R." is somewhat captious in his reference to my remarks on Pears in 1837 and now. I have said nothing whatever to discount the high merits of Marie Louise, or of Citron des Carmes, or of Williams' Bon Chrétien, all first-rate varieties of their season. I praised or blamed none individually, but in mentioning a dozen of the best of 1837, said that a select list now would show very superior excellence. Of the eating varieties mentioned the very few ranking high to-day are the three mentioned, and Passe Colmar, Glou Morceaux, and Duchesse d'Angoulême when well grown. But several others would not come in at all. Besides Doyenné du Comice, a variety that is amongst Pears what Cox's Orange-Pippin is amongst Apples; both fruits having raised our estimate of true flavour and quality materially in each case. There are Winter Nellis, Louise Bonne, Beurré Rance, Marie Benoist, Thompson's, Seckle, Easter Beurré, Brown Beurré, Josephine de Malines, Beurré Superfin, and indeed many others that could be named, in which average excellence is much higher than it was in Pears sixty years since. As to baking Pears, I specially exempted these from the qualification. It was eating Pears only that were compared. *The Writer.*

THE CRYSTAL PALACE ROSE SHOW.—If the exhibition of the National Rose Society at Portsmouth was the smallest the society has yet held, that which took place at the Crystal Palace on the 2nd inst. proved on the other hand the most extensive on record. The number of exhibition Roses staged in competition on that occasion amounted in all to 7,200, or 1,450 more than the average for the five previous metropolitan shows of the society, and 100 blooms more than at the largest of those exhibitions, that of 1892. There were over 100 exhibitors, whose exhibits arranged according to the number contributed by each county were as follows:—Essex heads the lists with 71 exhibits, Surrey comes next with 51, then Middlesex with 35, Herts 34, Kent 32, Oxford 29, Notts 26, Somerset 20, Sussex 20, Worcester 19, Gloucester 15, Suffolk 15, Berks 12, Leicester 10, Wilts 8, Bucks 7, Devon 6, Hants (including Isle of Wight) 6, Derby 5, Northampton 5, Yorks 3, Bedford 2, Cambridge 2, Shropshire 2, Dorset 1, Stafford 1, and Warwick 1. In addition to the English contributions, seven exhibits came from Wales, and eleven from Ireland; but, unlike last year, there were no Scotch-grown Roses. Seldom, if ever, has the society held a more enjoyable exhibition. The day, although dull, proved fine and cool, thus allowing the blooms to continue fresh and bright during the whole day. The general quality of the flowers was remarkably good, and particularly was this the case in the exhibits from many of the smaller growers. Moreover, there was at no time any overcrowding, so that the blooms could be inspected in comfort by both members and visitors. *E. M., Berkhamsted.*

HOME CORRESPONDENCE.

EARLY CAULIFLOWER.—When visiting Mr. J. C. Dun Water's gardens at Craigton, Stirlingshire, on June 5, I was surprised to observe a large number of Cauliflowers ready for consumption. This was the more striking from the fact of the valley of the Endrick, on

CELERIAC.—In the article of July 3 on "Plants of the Victorian Era," you state that Celeriac was added to our varieties of Celery during the Queen's reign, but it was grown in 1791, as proved by the

following quotation taken from an old *Gardeners' Kalender* I possess, by Thomas Mawe, gardener to the Duke of Leeds; John Abercrombie, gardener, Newington, Surrey, formerly of Tottenham Court, Middlesex, and other gardeners. "Let it be observed there are two sorts of Celery; one known by the name of Italian, or upright Celery; the other called Celeriac, or Turnip-rooted Celery." A. Goldring. [It was known long before, but not in general use here till the time mentioned. Ed.]

ANNUAL STRAWBERRIES.—Strawberries grown as annuals have many advantages over those grown as perennials. In the first place, you save a year by very little extra labour; layering them into small pots does not take so much more time than laying them into nursery lines till the spring, as is generally done. Then, what fine fruit you get off the annuals! and so far as I have practised the annual system, nearly all sorts do well treated so, especially Noble, Royal Sovereign, Keen's Seedling, and British Queen. Here let me say Noble ripens quite a week earlier than Royal Sovereign or the Vicomtesse. Perhaps it will be of interest to those of your readers who have not tried this plan if I give a short account of how I proceed. I plant a few lines of runners in the spring of the varieties I wish to treat as annuals, keep all flowers picked off, so as to throw all the strength of the plant into the runners; layer them into 3-inch pots as soon as I can get them, sink the pots level with the soil, which keeps them moister, and there is less danger of the miniature plant being displaced. I usually place a small stone on the pots to keep the runners in place till rooted, though pegs do equally well. As soon as nicely rooted in the pots, severing them from the parent plant, placing them behind a north wall for a week or ten days, till fully established, then planting them out from 1 to 1½ foot apart in well prepared ground, deeply worked with plenty of rotten manure incorporated with the soil. When planting, they want to be made quite firm, which conduces to sturdy growth, well matured in dry weather, and frequently stirred with a hoe. It is the practice of some good cultivators to mulch them in the autumn, but I do not think it at all necessary to do so; in fact, I think leaving them fully exposed to the frost is an advantage, especially on heavy land such as I have here. And by leaving them unmulched till the end of April, you can conveniently keep them well stirred with the hoe. A light sprinkling of some good artificial manure dusted over them in showery weather will help them greatly when showing their flowers, and the cultivator will be rewarded with fruit of large size and first quality. The sorts I find to do well thus treated are Noble, Royal Sovereign, Sensation, Keen's Seedling, and British Queen. *James Dryden, Grove Park Gardens, Kingsbury, Middlesex.*

STRAWBERRIES.—Royal Sovereign, for size, form, flesh, brightness of colour, and nice flavour, is an early variety unsurpassed. Here, with us, growing alongside of Laxton's Noble, it ripened at the same time, but the fruits were better in every respect; if the variety behaves as well generally, it is likely to become very popular. As a forcer I have seen it very fine. Mr. Hall, at Roydon Hall, Tonbridge, who forced some of the plants, speaks in the highest terms of it. In the north of England, too, I had the opportunity of seeing very fine plants heavily cropped. As regards some of the newer Strawberries, I found but little, if anything, to recommend them in preference to old varieties. There is no utility in cultivating a great number of varieties, and six to eight are, in my opinion, ample in most gardens. Where a great number are grown, there is much care required to keep the stocks true. I always found Noble, when grown on the single-crown system, useful fruit for affording early dishes, but the flavour is poor, and the pulp soft—still, it is of use as forming a succession to the forced plants. Royal Sovereign will probably take its place in course of time. Vicomtesse d'Horcail du Thury, Sir C. Napier, La Grosse Sucrée, President, Sir Joseph Paxton, Oxonian, and British Queen, are amongst the best Strawberries that I ever grew, and I can speak of all of these doing well in pots, too, with the exception of the last-named, which I never grew as a pot-plant. Auguste Nicaise grows to a great size, but I do not think much of it, the fruit being coarse—still, it may be excellent in some places. Fruits of the better class which turn the scale at, say, 1 oz., are, in my opinion, large enough for dessert purposes. Those who like deep-coloured fruits will find in Waterloo one to suit them. Some

twenty years ago I was living in North Lincolnshire, and in that part Dr. Hogg and Admiral Dundas were largely grown. The fruits of the latter grow to a good size, and are of very good flavour. *H. Markham, Margate, June 28.*

THE RENAISSANCE OF THE HOLLYHOCK.—In a measure I wish to corroborate one of the statements of your correspondent "D. T. F.," p. 407, on the above subject. About two years since I was looking round Messrs. Sutton's nursery and trial-ground in the London Road, Reading, in company with Mr. Martin, the well-known foreman, and in that well sheltered and favourably situated piece of ground, I saw the healthiest piece of Hollyhocks I had seen for many years. I asked Mr. Martin if the disease still gave trouble, he said, "Well, those do not show much sign of it, do they?" and I thought so too, but he said, "We do them well, and as soon as a diseased leaf shows itself we burn it." I have tried many remedies for the Hollyhock fungus, but without success. Twenty years ago a gentleman connected with the horticultural press asked me to try some remedies and report thereon, but they did no good, and I let the matter drop. This year I have tried the mixture I use for the Apple and Pear trees, viz., a weak solution of the Bordeaux Mixture and Paris Green—and with no effect. I had them dressed with bone superphosphate, and dusted with sulphur, but with no beneficial result; it is still a case of an affection for which a remedy is still wanted. *R. M., Newbury.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JUNE 29.—*Present:* Mr. McLachlan (in the chair); Rev. W. Wilks, Prof. Church, Dr. Bonavia, and Rev. G. Henslow, Hon. Sec.

Romneya, diseased.—The following report was received from Kew upon the specimens sent to the last meeting:—"The disease is caused by an obscure organism, considered by Prunet as a species of *Cladochytrium*. A preliminary notice is given in *Comptes Rendus*, October 1, 1894. The detailed account there promised is not yet to hand."

Grapes attacked by Gloeosporium.—With reference to the examples sent to the last meeting, Mr. Malcolm Dunn writes, after inspecting the Vine-houses at Aughterarder House, that "the vine is of the usual 'lean-to' form, well heated and ventilated, with everything in good order for growing healthy Vines and first-rate Grapes. The Vines comprise some six or seven varieties, but only Black Hamburgh suffers to a serious extent from the disease; although it could be detected on a few berries of Foster's White Seedling, and still fewer of Alicante. As far as I can remember, Muscat of Alexandria, Lady Downes, Madresfield Court, Gros Colman, and one or two others were not affected, although intermixed with the Vines attacked. The Vines are all in vigorous health, and bearing a fine crop of splendid bunches of Grapes. With regard to the treatment they were receiving, I saw nothing to which I could object."

Harpalus ruficornis attacking Strawberries.—Mr. McLachlan showed specimens of this beetle, which belongs to a carnivorous family. Its prevalence in Strawberry-beds is probably caused by the presence of the litter. That it will attack Strawberries has been known for the last ten years, and that it has destroyed entire crops. As it is nocturnal in its habits, it must be looked for at night, for it lives in the soil.

Fruit and Vegetable Committee.

JULY 1.—A meeting of the Fruit and Vegetable Committee was held at Chiswick on the above date, and there were present Messrs. BUNYARD, Chairman; and Messrs. W. Wilks, J. Smith, G. Sage, W. Pope, J. H. Veltch, R. Fyfe, A. Dean, A. F. Barron, A. H. Pearson, and J. Hudson.

Fifty-four varieties of Peas, including several of standard varieties for comparison, were examined, but only three awards of the lowest class were made—that is, 2 marks. It is well to make clear that, in Chiswick parlance, 2 marks represent a commendation, 3 marks high commendation, Award of Merit very high commendation, and First-class Certificates only very superior excellence and distinctness.

The Awards of 2 marks were made to Saccharine (SIX), having haulm 4 feet in height, and long green, somewhat sugary pods; to Dickson's Harbinger, with haulm 4 feet high, very productive, medium-sized pods, but early; and to Parchment Pea (VULGARIS), an odd appellative for one of the flat-podded forms that are esteemed by some when cooked whole. Generally the Peas grown showed no advance or variation on older varieties, and indeed there was none so good as the best of last year's trials.

Some Broad Beans were next examined, and an Award of Merit was given to Dobbie's Champion, a good cropper, the pods long, clean, and handsome. Three marks were given to Harrison's Robin Hood, a Green Long-pod, and a capital

stock; and also to Exhibition Long-pod, from Messrs. R. VERRIN & SONS, practically confirming a previous award. This is a capital stock of the Seville type of Bean.

A large collection of Strawberries was then examined, the bulk of the plants being in fine condition, and cropping well, some having remarkable produce. Of these, Newton Seedling, Wonderful, Acquisition, and others were strikingly productive. The only award made was to Wonderful, a variety having long scarlet fruits, not large, but produced in great abundance; to this an Award of Merit was given. Edward Lefort, Countess, Auguste Boisselot, Royal Sovereign, President, all so good last year, were again of the best for flavour—a feature so markedly absent in the bulk of the varieties. Two new ones of yearling plants only, Admiral and G. Wythes, showed considerable promise, but they will have to be examined another year. No doubt, as a huge cropper, where quality and solidity of flesh is of little importance, Acquisition is the variety to grow; and for preserving, Newton Seedling is, without doubt, a marvellous cropper.

Mr. HAWES, of Slough, sent a Melon, Golden Jubilee, which was thought to be a reproduction of Hero of Lockinge; and a second fruit came from elsewhere that was imperfectly ripened, though showing fair flavour. Mr. A. J. WARD, of Richmond, showed from his allotment on the corporation group, splendid examples of Daniel's Alderman Pea (a superb variety), Maincrop, Eureka, Gradus, stragatema, and The Daniels, a good Telephone, and was unanimously awarded a Cultural Commendation. He also showed a good sample of exhibition long-pod Beans.

Floral Committee.

Roses and Violas at Chiswick.—The Floral Committee met at the Chiswick Gardens to inspect the trials of Tea Roses and Violas, the former as to their adaptability for bedding or planting-out for garden decoration. Some had not done well, and others were not yet fully in bloom; but the following were selected for Awards of Merit:—Innocents Pirola, Souvenir de Paul Neyron, Marie Van Houtte, Grand Duc de Luxembourg, Etoile de Lyon, François Kruger, Hon. Edith Gifford, White Lady, William Allen Richardson, Madame Pernet Ducher, Augustine Hatern, and Edouard Sallabelle. Of Violas the following were selected for Awards of Merit:—Iona, Pencilland, Blue Gown, Mrs. Bellamy, and William Niel. The Floral Committee made a recommendation to the effect that a comprehensive trial of Violas should be arranged for at Chiswick in 1898, and the varieties of one colour, such as yellow, blue, white, &c., be planted side by side so as to admit of close comparison.

NATIONAL ROSE.

JULY 2.—The Metropolitan Show of this Society was held at the Crystal Palace on the above date, and was very successful. The exhibits were staged in the space opposite the great organ. (See also pp. 20 and 23).

Seventy-two distinct single trusses.—The unusual quality of the blooms throughout the show was well illustrated in the first and most important class, by which the Trophy and Replica were won. There was plenty of competition, and an abundance of good flowers. However, Messrs. HARKNESS & SONS, Bedale, Yorks, and Hitchin, the winners of the same class last year, were well let. The blooms staged were—Back row: Ulrich Brunner, Mrs. Paul, Etienne Levet, Mrs. S. Crawford, Horace Vernet (a very pretty bloom, and awarded a Medal), Mrs. Jno. Laing, Gustave Piganon, Marquise de Litta, Dupuy Jamain, François Michelin, A. K. Williams, Helen Keller, Marquise de Castellane, Her Majesty, S.-M. Rodocanachi, Marchioness of Londonderry, Marie Verdier, Exposition de Brie, Caroline Testout, Earl of Dufferin, Madame E. Verdier, Marie Baumann, Comte de Rahm-baud, and Madame Jos. Bonnavier. Centre row: Madame Gabrielle Luizet, Prince Arthur, K. A. Victoria, Comte de Ludro, Mrs. W. J. Grant, Marie Rady, Star of Waltham, Marchioness of Dufferin, Camille Bernardin (good), Catherine Mermet (fine), General Jacqueminot, Thomas Mills, Lady Mary Fitzwilliam, Captain Christy, Chas. Lefebvre, Marchioness of Downshire, Duc d'Orleans, Madame Montet, Ed. Andry, Souvenir d'Elise, Captain Hayward, Maréchal Niel, Mrs. Jowett, and La France. Front row: Dr. Andry, Duchess de Morny, Madame Hausmann, Baroness Rothschild, Fisher Holmes, Silver Queen, Duke of Connaught, Madame Cusin, Duke of Wellington, Beauty of Waltham, Abel Carrière, White Lady, Xavier Olibo, Margaret Dickson, Jean Linbaud, Madame de Watteville, Duke of Edinburgh, Duke of Kent, Madame Delville, Victor Hugo, Vicomtesse Folkestone (?), Crown Prince, The Bride, and Sir Rowland Hill.

The veteran exhibitor, Mr. B. R. CANT, of Colchester, was not many points behind Messrs. HARKNESS, and his collection of blooms made a capital exhibit for 2nd place. Marie Baumann, Caroline Testout, A. K. Williams, Gustave Piganon, Madame Eugénie Verdier, Madame de Watteville, Countess of Rosebery, Madame Cusin, Lady Helen Stewart, Maman Cochet, The Bride, Souvenir d'un Ami, Duchess de Morny, Alfred Colomb, Madame Hoste, Souvenir de S. A. Prince, &c., were all good and exemplary. The 3rd position was taken by Messrs. FRANK CANT & CO., Braiwick Nursery, Colchester. The following were instances of capital blooms in this stand, Bridesmaid, Madame Cusin, General Jacqueminot, Jeannie Dickson, Souvenir de President Carnot, Pride of Reigate (the striped Rose), Star of Waltham, Marie Rady, and Souvenir de Elise. Messrs. PAUL & SONS, Chesham, and ALEX. DICKSON & SONS, Newtownards, Ireland, also competed with credit.

Forty distinct Roses (trebles).—Mr. B. R. CANT was the winner of the 1st prize in this class, and it was won with an exhibit of much merit. The trebles most effective were those of Etienne Levet, L'Havre, Earl of Dufferin, La France, Madame Eugénie Verdier, Camille Bernardin, Marquise de Litta (this new Rose in excellent form), A. K. Williams, Mrs. Jno. Laing, Mrs. Sharman Crawford, Gustave Piganeau, A. Colomb, Victor Hugo, Helen Keller, Madame Cusin, Duchesse de Morny, and Beauty of Waltham. Messrs. HARKNESS & SONS were little behind the winners of the premier honours, for their stand was beautifully bright, and some of the trebles of first-class quality. Such were Gustave Piganeau, Marquise de Litta (a really good Rose), Marie Baumann, Camille Bernardin, Helen Keller, Comte de Raimbaud, Horace Vernet, &c. The 3rd prize was taken by Messrs. F. CANT & Co., of the Braiswick Nursery, Colchester.

Forty-eight distinct trusses.—The quality of the blooms in this class was below that in the competition for the best seventy-two blooms. Messrs. TOWNSEND & SONS, Lower Broadmeath, Worcester, were 1st, and the varieties they exhibited we append. Back row: Gustave Piganeau, Lady Mary Fitzwilliam, Heinrich Schultheiss, Pride of Waltham, Chas. Lefebvre, Mrs. Sharman Crawford, White Lady (good), Alfred Colomb, Marquise de Litta (very fine), Caroline Testout, Camille Bernardin, Mlle Eugénie Verdier, Victor Verdier, La France (good), Dupuy Jamain, and Mrs. Jno. Laing. Centre row: Victor Hugo, Kaiserin A. Victoria, Marie Verdier, Innocente Pirola (very pretty bloom), Comte de Raimbaud, Marchioness of Londonderry (bloom much damaged), Fisher Holmes, Madame G. Luizet, La Duchesse de Morny, Her Majesty, A. K. Williams, François Michelin, Xavier Olibo, Marie Van Houtte, S.-M. Rodocanachi, and Catherine Mermet. Front row: Prince Arthur, The Bride, Horace Vernet, Souvenir de S. A. Prince, Duke of Wellington, Margaret Dickson, Lord Bacon, Caroline Kuster, Marie Baumann, Jean Ducher, Madame Cusin, Comtesse de Panisse, Duke of Edinburgh, Anna Olivier, Beauty of Waltham, and Medea. There being at least nine competitors in this class, the 2nd position, which was secured by Messrs. J. BURRELL & Co., Howe House Nurseries, Cambridge, was also a very coveted one. Indeed, the collection of blooms in this stand was a very fine one. The following varieties were displayed best: Horace Vernet, Duke of Wellington, Ethel Brownlow, Princess of Wales, Mrs. John Laing, Bridesmaid, Ellen Drew, and Comte de Raimbaud were good. Messrs. G. & W. H. BUNCH, Peterborough, were 3rd, and it was an easy matter to point to a number of Roses of much excellence in this stand.

Twenty-four distinct single trusses.—Mr. CHAS. TURNER, Royal Nurseries, Slough, beat all competitors in this class, and staged the following varieties. Back row: Victor Hugo (weak), Marchioness of Londonderry, Xavier Olibo, Mrs. J. Laing, Reynolds Hole, Duchesse de Morny, Prince Arthur, and Her Majesty. Centre row: Marie Baumann, François Michelin, Penelope Mayo, Louis Van Houtte, Ulrich Brunner, Mons. E. Y. Teas, Caroline Testout. Front row: Madame Victor Verdier, Lady Sheffield, Fisher Holmes, Ernest Metz (good), Dr. Andry, Madame Gabrielle Luizet, A. K. Williams, and Gustave Piganeau. Of the nine other exhibitors, Mr. J. SO. MATTOCK, New Headington Nursery, Oxford, succeeded in obtaining 2nd prize, but was closely followed by Mr. RALPH CROSSING, Penarth Nurseries, South Wales.

Twenty-four distinct Trebles.—A very commendable collection of blooms from Messrs. D. PRIOR & SONS, Colchester, secured for the firm premier position, amid very extensive competition. The following trebles were the best: Mrs. Sharman Crawford, La Rosière, Gustave Piganeau, Kaiserin Augusta Victoria, Ulrich Brunner, and Marquise de Litta. Mr. GEO. MOUNT, Canterbury, who was 2nd, exhibited a fine lot of Roses; and Messrs. TOWNSEND & SONS, who were 3rd, had likewise many very meritorious trebles. There were about a dozen competitors in this class.

Extra Class.—This was for twelve distinct single trusses of varieties sent out by Messrs. A. DICKSON & SONS. The 1st prize was taken by Messrs. HARKNESS & SONS, staging the following fine varieties that have been placed into commerce by the above firm: Helen Keller, Earl of Dufferin, Mrs. W. J. Grant, Marchioness of Londonderry, Marquis of Downshire, Muriel Grahame, Mrs. R. G. Sharman Crawford, Marchioness of Dufferin, Marjorie, Ethel Brownlow, Jeannie Dickson and Margaret Dickson. Mr. B. R. CANT, who was 2nd, included Lady Helen Stewart, and in this stand, and that from Messrs. F. CANT & Co., the variety Tom Wood was staged.

TEA AND NOISETTE SECTION.

Twenty-four distinct, single trusses.—Messrs. FRANK CANT & Co., gained the 1st prize in this class, and staged a very fine even lot of blooms of very superior quality. The varieties were:—Back row: Maman Cochet, Madame de Watteville, Souvenir de S. A. Prince, Madame Cusin, Hon. Edith Gifford, Souvenir d'un Ami, The Bride (good). Centre row: Souvenir de Elise, Comtesse de Nadailac, May Rivers, Catherine Mermet (very good), Amazon, Jean Ducher (very pretty specimen), Madame Bravy, Madame A. Etienne. Front row: Comtesse de Panisse, Anna Olivier, Medea, Ethel Brownlow, Francisca Kruger, Ernest Metz, Etolle de Lyon, and Marie Van Houtte. Messrs. D. PRIOR & SONS were 2nd, and included excellent specimens of Madame A. Watteville, Madame Cusin, Ethel Brownlow, The Bride, and others. The collection from Mr. GEO. PRINCE, Oxford, would have taken 1st honours at last year's exhibition, but in the present case it gained 2nd prize only.

Eighteen distinct single trusses.—Messrs. J. BURRELL & Co. were 1st in this case, and again the blooms were above the

average. Ernest Metz, Catherine Mermet, Princess of Wales, Golden Gate, Madame Cusin, Muriel Grahame, Bridesmaid, and Madame de Watteville were all capital. The 2nd prize was taken by Mr. JAS. MATTOCK, New Headington, Oxford, and the 3rd by Messrs. J. TOWNSEND & SONS, Worcester, there being several other competitors.

Eighteen distinct, three trusses of each.—Mr. G. PRINCE had the best trebles in this class, and the exhibits throughout were very satisfactory. Mr. Prince's best were Maman Cochet, Madame Cusin, Comtesse de Nadailac, Anna Olivier, Innocente Pirola, Ethel Brownlow, and Princess of Wales. A very even lot indeed obtained 2nd prize for Mr. B. R. CANT. His collection included superb trebles of Madame Cusin, Luciole, and Madame de Watteville. 3rd, Messrs. D. PRIOR & SONS.

GARDEN ROSES.

Thirty-six bunches, distinct, not fewer than three trusses to a bunch.—Always an interesting section of the show, and frequently the brightest also, are the classes devoted to the display of "garden" Roses, a term used to describe varieties that may not be suitable for exhibition, but which in the majority of instances are the very best wherewith to adorn a garden, furnish a vase, or decorate a room. On this occasion they were exquisite, and it was a splendid collection that won 1st prize in this class for Messrs. PAUL & SON, Cheshunt, the trusses good, and representative of some of the most showy of the class. Conspicuous was a new variety named Dawn, with uncommonly large semi-double flowers of a soft and beautiful tint of rose colour, the foliage being also broad and vigorous-looking. Messrs. COOLING & SONS, Bath, though 2nd, had a most attractive exhibit in this class.

Eighteen bunches, distinct varieties, not fewer than three trusses to a bunch.—This class was won by Mr. CHAS. TURNER, Royal Nurseries, Slough. Amongst the varieties we noticed several of the Polyantha section, also the showy Bardon Job, Perle d'Or, Turner's Crimson Rambler, and others equally well known. Mr. J. SO. MATTOCK, who was 2nd, included a larger number of the Noisette Roses; 3rd, Messrs. TOWNSEND & SONS.

OPEN CLASSES.

Bunches of Roses.—This class is for bunches of Roses as one would cut them for furnishing a vase. There are twelve bunches, distinct, not more than seven trusses to a bunch. Mr. J. SO. MATTOCK was 1st, and showed Margaret Dickson, Ulrich Brunner, Violet Bouyer, Louis Van Houtte, Mlle. de Watteville, Comtesse de Nadailac, Duchess of Bedford, Madame Hoste, Horace Vernet, Innocente Pirola, Anna Olivier, and Marie Van Houtte. These bunches were arranged—faced slightly—so as to display the flowers fully. Messrs. PAUL & SON, Cheshunt, were 2nd; and Mr. R. CROSSING, Penarth Nurseries, 3rd, there being two other collections staged.

Twelve trusses of Hybrid Tea, not fewer than nine varieties.—A stand containing some excellent blooms from Messrs. D. PRIOR & SON obtained 1st prize; Marquise de Litta, Caroline Testout, Kaiserin A. Victoria, La France, Captain Christy, Mrs. W. J. Grant, White Lady, Lady Mary Fitzwilliam, La Fraicheur, and Auguste Guinolaeseau were the varieties shown. The 2nd prize was awarded to a collection of small-r, well-formed blooms, from Messrs. A. DICKSON & SONS; and Messrs. FRANK CANT & Co. were 3rd. If the term hybrid "Teas" is not a very happy one, it is the name given to a class which undoubtedly includes some of the prettiest Roses.

Best Stand of Yellow Roses.—The best twelve blooms of any yellow Rose were from Mr. GEO. PRINCE, who had very good specimens of the peculiarly distinct and beautiful variety, Comtesse de Nadailac; Messrs. J. TOWNSEND & SONS, who were 2nd, were followed by Mr. B. R. CANT, with good specimens of Madame Hoste.

Best Stand of White Roses.—Messrs. ALEX. DICKSON & SONS were 1st with beautiful examples, of fine form, of the variety Kaiserin Augusta Victoria; Mr. B. R. CANT following with Marchioness of Londonderry.

Best Stand of any Tea or Noisette Rose.—The unique Madame Cusin gained the 1st prize for Mr. B. R. CANT, who had a dozen magnificent specimens; Mr. GEO. PRINCE was 2nd; and with Madame de Watteville, Mr. FRANK CANT was 3rd.

Best Stand of Crimson Roses.—The 1st prize was won by the variety A. K. Williams, from the nurseries of Messrs. ALEX. DICKSON & SONS. Ulrich Brunner, from Messrs. D. PRIOR & SONS, was 2nd; and Messrs. TOWNSEND & SONS, who were 3rd, showed the same variety as the winners.

The best specimen of a Dark Rose.—This was seen in a stand from Messrs. HARKNESS & SONS, who had the velvety crimson variety Horace Vernet. The same variety won 2nd place for Mr. B. R. CANT; and Messrs. A. DICKSON & SONS were 3rd.

Twelve single trusses of any light-coloured (other than white) Rose.—The excellent variety Mrs. Jno. Laing was again much the best in this class. It was shown by Messrs. TOWNSEND & SONS; Mr. B. R. CANT and Messrs. D. PRIOR & SONS, who were 2nd and 3rd respectively in each case, staged Her Majesty.

Twelve single trusses of any new Rose.—The new Roses were of more than usual interest, some being exceptionally good and promising, while there were no fewer than eleven new varieties staged for the Gold Medal, and cards of commendation. Messrs. A. DICKSON & SONS, Newtownards, Ireland, were well in front with their grand Hybrid Tea, Mrs. W. J. Grant; Messrs. HARKNESS & SONS following with Helen Keller (also an introduction from Newtownards), and Messrs.

F. CANT & Co. with their new H.P. Mrs. Frank Cant. There was a good box of Maman Cochet from Messrs. PRIOR & SON Colchester. Nine lots were staged.

Twelve new Roses distinct.—Messrs. A. DICKSON & SONS, Newtownards, were a long way ahead, and staged, we believe, varieties only of their own raising. Countess of Caledon, Tom Wood, Lady Clamorris, Ulster, Killarney, Eileen, Mrs. W. J. Grant, Mrs. Mawley, Bessie Brown, First Cross, Mrs. Grahame, and Daisy: one of the best boxes of new Roses we have seen. Messrs. F. CANT & Co. were 2nd, having Tom Wood, Helen Keller, and Sylph in good form; and Mr. B. R. CANT, Colchester, 3rd.

Three single trusses of any new seedling-Rose or distinct sport.—The following were staged for the Gold Medal. F. W. Sanford, a pale blush H.P. from Messrs. CURTIS, SANFORD & Co., Torquay. Ulster, a new H.P. from Messrs. A. DICKSON & SONS, Newtownards, secured the Gold Medal. This is a Rose of immense substance, vigorous in growth, and with smooth wood. Its main colour is the deep shade found in Caroline Testout, but the whole flower is quite distinct. A card of Commendation was awarded to a deep scarlet single, named Royal Scarlet. Messrs. DICKSON & SONS also staged Countess of Caledon and Mrs. Mawley (a little too much like a pale or badly-coloured Maman Cochet). Messrs. G. PAUL & SONS, Cheshunt, put up their H. P. Rev. Allen Cheales, in fair form, but not so good as we saw it at Portsmouth; evidently a free grower and bloomer, with a combination of the colours found in Marquise de Litta and Madame Cusin. Mr. RUMSEY, Waltham Cross, showed H.P. Mrs. Rumsey, a pretty clear pink that is destined to become one of our most popular decorative Roses, especially for autumnal cutting. Plants of Madame Berard, with variegated foliage came from Messrs. G. BUNYARD & Co., Maidstone, but were at once passed over, as no flowers were shown. A Hill Gray, from Messrs. PRINCE, Oxford, although of not quite the same growth, reminds one too strongly of an indifferent Comtesse de Nadailac. The same may be said of Mrs. Jefferies, from Messrs. JEFFERIES & SONS, Cirencester, the growth and blooms far too much resembling Maréchal Niel in some of its stages. H. P., R. B. Cator, from Messrs. COOLING & SONS, Bath, is promising; somewhat after the colour of H. Keller, but more cupped, and distinct in growth. Mrs. F. Cant reminds one of a very pale Madame Gabrielle Luizet, but was exceptionally well shown in the class for twelve new Roses, and again in twelve of any new variety.

A particularly promising new Rose named Killarney, came from Newtownards; it appears to be a hybrid Tea, of grand size, substance, and form; a clear, soft, salmony-peach, with silvery edges, and most distinct.

Single-flowered Roses, nine bunches, distinct.—Messrs. COOLING & SONS, Bath, were 1st, and included the following varieties:—Rugosa, macrantha, Green Mistle, Paul's Single White, Cooling's Single Crimson, Himalaya, Lucy Ashton, Pissardi, and Lucida; Messrs. PAUL & SONS, Cheshunt, who were 2nd, included a bunch of R. rubrifolia; and Miss MELLISH of Hodssock Priory, Worsop, 3rd.

Roses suitable for Buttonholes.—These exquisite Roses were well shown by Mr. J. SO. MATTOCK, in a class for not fewer than six varieties in twelve bunches. Those shown were the following, and, without exception, all of them are splendid for the purpose as the bud commences to open:—Comtesse de Nadailac, M. Pirola, Ma Capucine, Niphetos, Amazon, Anna Olivier, Madame Falot, Hon. E. Gifford, Madame Hoste, Madame de Watteville, Rubens (beautiful), and Gustave Piganeau; 2nd, Mr. GEO. PRINCE; and 3rd, A. G. GREEN, Esq., Colchester.

AMATEURS.

All through the amateurs' classes the competition was both numerous and keen, scarcely a bad flower was to be found; while in the main classes, the average standard was even ahead of that found among the largest trade growers.

The Champion Trophy and Replica for thirty-six single trusses, distinct, was open to all amateurs, and brought out five grand stands: E. B. LINDSELL, Esq., Bearton, Hitchin, winning with Ulrich Brunner, Charles Lefebvre, Marchioness of Londonderry, Marchioness of Dufferin, Gustave Piganeau, Her Majesty, Alfred Colomb, S.-Marie Rodocanachi, Comte de Raimbaud, Mrs. W. J. Grant, Duc d'Orleans, Mrs. John Laing, Duchess of Bedford, Innocente Pirola, Horace Vernet, Muriel Grahame (Silver Medal), Prince Arthur, Madame de Watteville, Fisher Holmes, Catherine Mermet, Earl of Dufferin, Madame Cusin, Sir Roland Hill, Merville de Lyon, Louis Van Houtte, K. A. Victoria, Alfred K. Williams, Gabrielle Luizet, Madame Hausmann, La France, Dr. Sewell, Madame Hoste, Madame Victor Verdier, Comtesse de Nadailac, Dr. Andry, and François Michelin. C. J. GRAHAM, Esq., Wyrolands, Leatherhead, was 2nd, and had superb blooms of White Lady, Charles Lefebvre, Xavier Olibo, K. A. Victoria, Horace Vernet, and Fisher Holmes; H. V. MACHIN, Esq., Gateford Hill, Worsop, being 3rd.

In this class the Rev. J. H. PEMBERTON staged a grand lot, but was disqualified for duplicating Earl of Dufferin; an unfortunate oversight.

For thirty-six singles, open to all amateurs.—Mr. E. B. LINDSELL was again in front, his twelve best flowers being Ulrich Brunner, A. K. Williams, Gustave Piganeau, Marie Baumann, Captain Hayward, Catherine Mermet, E. Y. Teas, Innocente Pirola, Alfred Colomb, Horace Vernet, and K. A. Victoria. T. HONNS, Esq., Eaton, Bristol, was 2nd, with a very neat and clean stand, but flowers much smaller than Mr. LINDSELL's; A. TATE, Esq., Downside, Leatherhead, 3rd. No fewer than nine competed in this class.

For eight trebles, distinct.—Eleven lots were staged, Mr. E. B. LIND-ELL again proving victorious; the varieties were Earl of Dufferin, Marchioness of Londonderry, Horace Vernet, Her Majesty, A. K. Williams, Mrs. John Laing, Ulrich Brunner, and Mrs. W. J. Grant; the Rev. J. H. PEMBERTON, Havering-atto-Bower, and A. TATE, Esq., Leatherhead, followed.

For twelve of any Rose except a Tea or Noisette (seven competed).—H. V. MACHIN, Esq., Worksoop, winning with good examples of Gustave Pigeon; S. GURNEY FOWLER, Esq., Glebelands, Southwoodford, 2nd, with Her Majesty; and Rev. J. H. PEMBERTON 3rd, with Mrs. John Laing.

Open only to growers of fewer than 200 plants of exhibition varieties.—Twelve competed in the class for twenty-four distinct varieties, S. S. BEROE, Esq., Braybury, Stevenage, Great Wooden, winning. His best flowers were Maurice Bernardin, Sénateur Vaisse, Her Majesty, Alfred Colomb, Catharine Mermet, and A. K. Williams. Mr. E. MAWLEY, Berkhamsted, was a remarkably close 2nd, showing Sénateur Vaisse, Dupuy Jamain, S.-M. Rodocanachi, Duke of Fife, Charles Lefebvre, Innocente Pirola, and others in grand form. R. E. WEST, Esq., Reigate, being 3rd.

Six distinct trebles.—Mr. E. MAWLEY won with some good blooms of Gabrielle Luizet, Ulrich Brunner, Marie Finger, Mrs. John Laing, Horace Vernet, and Dupuy Jamain. G. P. BURNAND, Esq., Hill Grange, Reigate, being 2nd; and CONWAY JONES, Esq., Huicelcote, Gloucester, 3rd.

Nine blooms of any variety except Tea or Noisette.—Nine competed in this class. O. G. ORPEN, Esq., Colchester, was a good 1st, with the finest box of K. A. Victoria we have seen, among which was the Silver Medal flower for a H.P. or H.T. bloom. E. M. BETHUNE, Esq., Horsham, 2nd, with Marie Baumann; and Mr. A. SLAUGHTER, Steyning, 3rd, with Charles Lefebvre.

For growers of fewer than 1000 plants of exhibition varieties.—For nine varieties, distinct, Mr. G. MOULES, Hitchin, won from eleven competitors, his blooms being Ulrich Brunner, Souvenir d'Elise Vardon, C. Mermet, C. Testout, Earl of Dufferin, François Michelon, Her Majesty, Beauty of Waltham, and Comte Raimbaud. M. WHITTLE, Esq., 56, Belgrave Avenue, Leicester, was a good 2nd; and A. F. PERKINS, Esq., Holmwood, Surrey, 3rd.

Six distinct trebles.—G. W. COOK, Esq., The Briars, North Finchley, won with good blooms of Mrs. J. Laing, Captain Hayward, La France, Ulrich Brunner, General Jacqueminot, and K. A. Victoria, in a strong class. R. H. LANGDON, Esq., Raymead, Hendon, 2nd; and M. WHITTLE, Esq., Leicester, 3rd.

For growers of fewer than 500 plants.—Here also there were eleven competitors in the class for nine blooms, distinct, R. F. HOBBS, Esq., Bromyard Road, Worcester, winning with Catharine Mermet, Heinrich Schultheiss, Ulrich Brunner, Maréchal Niel, A. K. Williams, Victor Verdier, Lady Mary Fitzwilliam, S.-M. Rodocanachi, and Comtesse de Nadailac. R. W. BOWYER, Esq., Halfway Cottage, Hertford, was 2nd; W. KINGSTON, Esq., 52, Gray Street, Bedford, 3rd.

Six single trusses, distinct.—No fewer than fourteen competed. A. MUNT, Esq., Templewood, Slough, winning with good flowers of Ernest Metz, The Bride, K. A. Victoria, A. K. Williams, Her Majesty, and Innocente Pirola. E. R. SMITH, Esq., Melford Lodge, Muswell Hill, was 2nd, and G. A. HAMMOND, Esq., Cambrian House, Burgess Hill, 3rd.

For four trusses, three of each, there were nine lots. H. P. LONDON, Esq., Shenfield, near Bruntwood, winning with Victor Hugo, C. Testout, La France, and Mrs. John Laing. J. PARKER, Esq., The Croft, Old Headington, was 2nd, and R. F. HOBBS, Esq., Worcester, 3rd.

A Silver Challenge Cup was presented by C. J. GRAHAME, Esq., in the above divisions, for an extra class of twelve distinct varieties. W. KINGSTON, Esq., 52, Gray Street, Bedford, won from thirteen competitors, his varieties being Xavier Olibo, A. Colomb, Souvenir d'Elise Vardon, Catharine Mermet, Ulrich Brunner, Louis Van Houtte, Mrs. John Laing, Camille Bernardin, Etienne Lovet, General Jacqueminot, La France, and A. K. Williams. Rev. C. JOHNSON, Capel St. Mary, Ipswich, was a very close 2nd, and M. WHITTLE, Esq., Leicester 3rd.

Six blooms of any Rose except Tea or Noisette.—Seventeen boxes were staged in this class. G. W. COOK, Esq., The Briars, North Finchley, winning with Mrs. John Laing; J. C. TRUMAN, Esq., Oaklands, Swanley, 2nd with Her Majesty; and R. W. BOWYER, Esq., Halfway Cottage, Hertford, with Caroline Testout.

The Silver Cup offered by Mr. C. J. GRAHAME for six single trusses of Roses sent out by Messrs. DICKSON & SONS, Newtownards, was easily won by E. B. LINDSELL, Esq., with Muriel Grahame, Helen Keller, Marchioness of Londonderry, Marchioness of Dufferin, Earl of Dufferin, and Mrs. R. G. SHARMAN CRAWFORD. Rev. J. H. PEMBERTON, Havering, was 2nd; and A. SLAUGHTER, Esq., Steyning, 3rd.

A Piece of Plate offered for six Roses distinct, grown by members who have never before won a prize at a National Rose Society's exhibition, was secured by the Rev. C. JOHNSON, Capel St. Mary, Ipswich; J. C. TRUMAN, Esq., Oaklands, Swanley, 2nd; and F. BAUER, Esq., Wood Green, N., 3rd. For a similar number, open only to amateurs joining the National Rose Society since the last Crystal Palace show, there were a ven lots, the 1st going to S. S. BEROE, Esq., Braybury, Stevenage, for Mrs. J. Laing, Prince Arthur, Madame Victor Verdier, Charles Lefebvre, General Jacqueminot, and Paul's Early Blush. Miss JESS, Firbeck Hall,

Rotherham, and Rev. R. POWLEY, Warminster, were 2nd and 3rd respectively.

The Piece of Plate, presented by E. MAWLEY, Esq., for six distinct Roses, grown within eight miles of Charing Cross, brought out eight competitors. G. W. COOK, Esq., The Briars, North Finchley, winning with Captain Hayward, Mrs. John Laing, Caroline Testout, Comtesse d'Oxford, Duke of Wellington, and La France. Mr. J. BATEMAN, Rose Vale, Archway Road, N., was a good 2nd; and E. R. SMITH, Esq., Melford Lodge, Muswell Hill, 3rd.

Six New Roses.—The Rev. J. H. PEMBERTON won 1st, showing good blooms of Charlotte Guillemot, Mrs. Crawford, Helen Keller, Captain Hayward, Marquise de Litta, and Marchioness of Downshire. O. G. ORPEN, Esq., West Bergholt, Colchester, 2nd; and Mr. J. BATEMAN, 3rd.

TEA AND NOISETTE SECTION.

These were very numerous, and in most cases the blooms were more free from bruised and discoloured outside petals than we have seen them for several seasons.

Nine competed for the Challenge Trophy and Replica offered for eighteen distinct singles, O. G. ORPEN, Esq., West Bergholt, Colchester, winning with a grand stand, consisting of Maman Cochet, Madame Hoste, Souvenir d'Elise Vardon, Souvenir d'un Ami, The Bride, Ernest Metz, Souvenir de S. A. Prince, Innocente Pirola, Comtesse de Nadailac, Madame Cusin, Cleopatra, Marie Van Houtte, Catharine Mermet, Medea, Maréchal Niel, Sylph, Caroline Kuster, and Madame de Watteville. C. J. GRAHAME, Esq., Wyrelands, Leatherhead, had grand flowers of Etiole de Lyon, Catharine Mermet, The Bride, Madame de Watteville, Niphotos, and Caroline Kuster, in his 2nd prize stand. Dr. L. P. BUDD, Bath, was 3rd.

For twelve distinct singles, ten competed, Mr. HARRIS, gr. to E. M. BETHUNE, Esq., Denne Park, Horsham, winning with Madame Cochet, F. Kruger, Madame Cusin, Medea, Catharine Mermet, The Bride, Marie Van Houtte, Etiole de Lyon, Ethel Brownlow, Madame Margottin, Bridesmaid, and Caroline Kuster, in good form. The Rev. H. BERNERS, Harkstead Rectory, Ipswich, was 2nd; and Dr. L. P. BUDD, 8, Gay Street, Bath, 3rd.

The Townsend-Boscawen Memorial Plate was secured by C. J. GRAHAME, Esq., against eight competitors. There was not a faulty flower among his trebles of Madame de Watteville, Caroline Kuster, Maman Cochet, Innocente Pirola, F. Kruger, Catharine Mermet, Madame Cusin, and The Bride. Dr. L. P. BUDD, Bath, 2nd; and O. G. ORPEN, Esq., Colchester, 3rd.

For nine blooms of any Tea or Noisette.—E. M. BETHUNE, Esq., Horsham, won with Catharine Mermet; C. J. GRAHAME, Esq., was 2nd, with Madame Cusin; and O. G. ORPEN, Esq., was 3rd, with the same variety.

For growers of fewer than 500 plants of exhibition Teas and Noisettes.—There were eight competitors for twelve distinct singles, Mr. J. PARKER, The Croft, Old Headington, winning; the Rev. J. H. PEMBERTON, 2nd; and CONWAY JONES, Esq., Huicelcote, Gloucester, 3rd.

For nine singles.—Miss BAKER, Holmfels, Reigate, was ahead; P. G. BURNAND, Esq., Reigate; and E. MAWLEY, Esq., Berkhamsted following.

For growers of fewer than 200 plants.—The class nine single trusses, distinct, found Rev. A. CECIL JOHNSON, Capel St. Mary, Ipswich, well ahead; Mr. G. MOULES, Hitchin, 2nd; and Mr. J. PARKER, The Croft, Old Headington, 3rd.

In the class for six singles, distinct, nine competed, Rev. F. R. BURNARD, Berrington Rectory, Shrewsbury, winning from M. WHITTLE, Esq., Leicester, and R. W. BOWYER, Esq., Halfway Cottage, Hertford.

For the Piece of Plate offered for four trebles, distinct, twelve competed, Mr. J. PARKER winning with The Bride, Madame Cusin, Marie Van Houtte, and Catharine Mermet, in good form; A. SLAUGHTER, Esq., Steyning, was 2nd; and C. JONES, Esq., Huicelcote, Gloucester, 3rd.

Six single trusses of any one variety.—F. HOBBS, Esq., Bromyard Road, Worcester, won with Catharine Mermet; Mr. J. PARKER, Old Headington, 2nd, with the same variety; and Mrs. E. CHOFF MURRAY, Ryde, 3rd, with Edith Gifford.

Messrs. Paul & Son's Piece of Plate for six bunches of distinct varieties was won by O. G. ORPEN, Esq., Colchester, for F. Kruger, Madame Hoste, Medea, Madame Cusin, A. Olivier, and Marie V. Houtte in good style. S. GURNEY-FOWLER, Esq., South Woodford, was 2nd; and Mr. J. PARKER, Old Headington, 3rd.

GARDEN ROSES.

The Silver Cup, presented by the Right Hon. Lord PENZANCE, for eighteen bunches of distinct varieties was won by H. V. MACHIN, Esq., Gatefold Hill, Worksoop with Ma Piquette, Madame Pernet Ducher, Red Damask, Rosa Mundi, Perle d'Or, and Laurette Messing, the best half-dozen bunches. A. TATE, Esq., Leatherhead, was 2nd, and had Mochata nivea, Moss cristata, and Gustave Regis in capital form.

The piece of plate for six bunches was secured by Mrs. A. F. PERKINS, Oak Dene, Holmwood, Surrey, Madame Plantier, Camens, Marquise of Salisbury, Madame C. Guinoleau, Madame Pernet Ducher, and Triomphe de Pernet Père being the varieties. F. W. CAMPION, Esq., Colley Manor, Reigate, was 2nd; and Rev. J. H. PEMBERTON, 3rd.

DECORATIVE SECTION.

Table decoration of Cut Roses and suitable greenery.—This was open only to lady members of a family of a subscriber to the Society, and was described as the Victorian Reign Com-

memoration Class. The 1st prize was won by Mrs. O. G. ORPEN, whose exhibit was an object-lesson in how not to spoil such efforts by introducing too much variety, or by too profusely furnishing the table. The arrangement of Noisette Roses, here and there a bloom of a Polyantha variety, and a little Maidenhair Fern, was as simple as pleasing.

Vase of Cut Roses, with cut foliage &c.—O. G. ORPEN, Esq., was 1st, with a vase lightly furnished with pink and white Roses, and a little Adiantum cuneatum Fern, &c.

MEDAL ROSES.

In the amateurs' divisions, the Silver Medals were awarded as follows: The best H.P. or H.T. was Kaiserin Augusta Victoria, shown by O. G. ORPEN, Esq.; and the new Rose Muriel Grahame (grand), shown by E. B. LINDSELL, Esq., was the best Tea or Noisette.

Among nurserymen, the best H.P. was a perfect but not extra large bloom of the well known Horace Vernet, in Messrs. HARKNESS & SON'S stand of seventy-two blooms distinct; and Madame Cusin, from Mr. B. R. CART, was the best Tea or Noisette. This was a fine bloom, but not so highly coloured as the variety sometimes is.

MISCELLANEOUS EXHIBITS.

Messrs. W. PAUL & SON, Waltham Cross, Herts, made a display with Roses in pots, and a fine lot of cut blooms. Many of the varieties represented have been raised by this firm during the present reign, and are well known, and some extremely popular. Spenser H.P., Emperor Alexander of Russia, 8 ar of Waltham H.P., bright purple-crimson, and the new Waltham Standard and Aurora, in company with many others, were shown as good general blooms. The plants in pots were young and dwarf, usually carrying about half-a-dozen blooms. An interesting exhibit.

Messrs. JARMAN & Co., Chard, Somerset, showed Roses; and Messrs. CHEAL & SONS, Crawley, Violas and Pansies, together with blooms of other hardy plants. Mr. FORSTER, of the Brookhampton Nurseries, made a display with Sweet Peas; and Messrs. WALLACE & Co. of Colchester, exhibited flowers of varieties of Lilies and Calochortis.

Messrs. JNO. LAING & SONS, Forest Hill, London, S.E., had a gigantic exhibit of plants, including, of course, a capital display of their tuberous-rooted Begonias, double and single. In addition to these, however, there were many Palms, 8 feet to 10 feet high, arranged upon the seats behind the dwarfier plants, also many good Caladiums, Souvenir de la Malmaison Carnations, Lilliums, and pretty foliage plants. Upon one side of these plants the same firm had an excellent lot of hardy herbaceous flowers in bunches, which made a gay picture.

Mr. M. PRITCHARD, Christchurch, had a few bunches of hardy herbaceous flowers also, the whole of them bearing evident indications of first class culture.

Messrs. A. W. YOUNG & Co., Stevenage Nurseries, Herts, were the contributors of yet another collection of similar hardy flowers so much in season at the present time. Most of these exhibits were arranged upon the temporary seats erected under the Royal Box, and immediately opposite to the great organ.

EALING HORTICULTURAL.

JUNE 30.—No more delightful place can be selected in which to hold a flower show than Gunnersbury Park, and this was the thirty-third exhibition of the society. Ealing, in respect of high-class exhibits, is suffering from the breaking-up of small estates, and the setting of them out for building operations, so there is a falling off both in the quantity and quality of the exhibits at the annual exhibition, more especially as the large specimens disappear, and are not replaced. As it was, five tents were required to take the exhibits which were forthcoming.

Roses are a leading feature, and the Jubilee Silver Cup offered for twenty-four blooms was won by Mr. C. TURNER, they were a fine fresh full lot of blooms, brilliant red H. P.'s predominating. There was a fair display of locally grown Roses, but the great heat in the tents soon told upon them.

Messrs. CHARLES LEE & SON, Messrs. JAMES VEITCH & SONS, and Messrs. E. SPOONER & SONS all contributed collections of Roses not for competition.

As far as plants are concerned, groups for effects take a leading place, the best of the large ones came from Mr. W. Roberts, gr. to J. HARRIS, Esq., Ealing; Mr. C. EDWARDS, gr. to C. TAYLOR, Esq., Ealing, was 1st with the smaller one. Specimen plants were of fair size, and shown in several classes; but with the exception of a good flowering piece of Lagerstromia indica and Datura suaveolens from Mr. C. Long, gr. to E. P. OAKSHOTT, Esq., Ealing, they called for no special remark. There were some very good specimen Gloxinias, good tuberous-rooted Begonias and Fuchsias, all well grown and bloomed. In the way of foliated plants there were well-grown Adiantums from two or three exhibitors.

Of miscellaneous productions there were fine and striking groups of plants from Mr. G. REYNOLDS, Gunnersbury Park Gardens; and Mr. HUDSON, of Gunnersbury House; also one of the same character from Messrs. FROMOW & SONS, Turnham Green; and, in addition, a good one of Japanese Maples. Messrs. C. LEE & SON had a large group of pictorial trees and shrubs, and Mr. C. TURNER, Royal Nursery, Slough, several very good specimen Pelargoniums, show and fancy which were greatly admired.

Fruit was fairly good, but by no means largely represented.

Vegetables were not up to the usual mark, owing, no doubt, to the earlier period on which the show was held; still, good samples were staged.

As is usual, a tent was set apart for table-decorations, shown in several classes. Chief among them were some exquisite bouquets and baskets by Mrs. H. B. SMITH, a well-known local florist.

The cottagers' productions from allotment-gardens were very good for the early period at which the show was held.

CROYDON HORTICULTURAL.

JUNE 30.—This was, as usual, an excellent show, the cut Roses being of especially good quality, and also plentifully shown.

NURSERMEN.

There were five competitors in the forty-eight varieties class. Messrs. HARKNESS & SONS, Bedale and Hitchin, leading Mr. R. R. CANT and Messrs. PRIOR & SONS, both of Colchester. The blooms here were particularly bright and clean. The winners for twenty-four varieties, shown in triplets, were 1st, Mr. B. R. CANT; Messrs. PRIOR & SONS, and Messrs. HARKNESS & SONS.

Messrs. G. & W. H. BURNS, Peterborough, were in front of Mr. G. W. PIPER, Uckfield, for a class of twenty-four varieties. In the class for eighteen Teas or Noisettes, all the winning stands came from Colchester, Messrs. PRIOR & SONS, F. CANT & Co., and B. R. CANT winning in the order named. Messrs. F. CANT & Co. were 1st with Kaiserin Augusta Victoria in twelve of any H. P. or H. T. class; and Mr. B. R. CANT for twelve Teas or Noisettes, with Madame Cusin.

AMATEURS.

The competition for the new challenge cup, offered for thirty-six distinct varieties, was keen, but Mr. E. B. LINDSAY, Hitchin, was an easy winner, with superb flowers, including on his stand the two silver medal blooms, viz., Her Majesty, the best H. P., and Mrs. J. LING, the best flower of that variety. T. B. HAYWOOD, Esq., Woodhatch Lodge, Reigate, was 2nd in the cup class. Mr. Mease, gr. to A. TATE, Esq., Leatherhead, was 1st for a good lot of twenty-four flowers of distinct varieties; and Mr. Harris, gr. to E. M. BARNES, Esq., Denne Park, Horsham, was 1st for eighteen Teas or Noisettes.

For growers of less than 2000 plants, Mr. E. MAWLEY secured 1st for twelve distinct, and also for twelve Teas and Noisettes, Mr. HARRIS being 2nd in each class. Mr. J. W. COOK, The Briers, North Finchley, Mr. W. D. FRESHFIELD, The Wilderness, Reigate, and Mr. M. HODGSON, Shirley, were very successful among amateurs. The Challenge Cup and the National Rose Society's Silver Medal for local growers, were secured by Mr. A. C. GIFFORD, South Norwood.

Plants and Groups.—Mr. Mills, gr. to F. G. LLOYD, Esq., Combe House, Croydon, won for twelve table-plants, six Dracaenas, and six Caladiums, for some grand Selaginellas, and for twenty-four varieties of hardy cut-flowers; Mr. C. J. SALTER, gr. to T. R. HAYWOOD, Esq., Reigate, winning for twenty-four stove and greenhouse varieties.

One of the most successful exhibitors in this division was Mr. Harris, gr. to PHILIP CROWLEY, Esq., Waddon House, Croydon, who was well ahead for groups, for nine ornamental foliage plants, for six stove and greenhouse plants in bloom, for six exotic Ferns, and for specimen foliage and flowering plants.

Vegetables were particularly good throughout.

Non-competitive exhibits were very numerous, and of high quality, the best being Begonias, Caladiums, and herbaceous flowers, from Messrs. J. LAING & SONS, Forest Hill; herbaceous flowers from Mr. BOX, Messrs. CHEAL & SONS, and Mr. CHARLTON; while Messrs. WALLACE & Co. staged a grand lot of Calochortus and Lilies.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 1.—The exhibits tabled on the Coal Exchange on the above date were choice and interesting throughout, and all bore marks of good cultivation. The committee consisted of W. Thompson, Esq., Walton Grange (Chairman), and Messrs. W. A. GENT (Hon. Sec.), G. S. BALL, J. ANDERSON, S. GRATRIX, H. GREENWOOD, G. LAW-SCHOFFIELD, A. WARBURTON, Wm. STEVENS, P. WEATHERS, E. J. SIDEBOTHAM, Robert JOHNSON, and J. CHARLESWORTH.

The Chairman (Mr. Wm. Stevens, gr.) put up the following plants: *Odontoglossum crispum giganteum* (Award of Merit). This was a very large flower, with chestnut blotches on a clear white ground, the sagittate lip being similarly adorned; the spike carried about a dozen flowers, rather open in the segments, and thus depriving it of the premier award. *Cattleya tenebrosa* Charlesworthi (Award of Merit) is a striking-coloured flower, the rich cinnamon-coloured segments a little elongated, contrasting well with a deep maroon-shaded lip, very prominent indeed from its oblong blade. The same exhibitor had *Laelia purpurata* Stevensii with a good dozen flowers on it, rather intra coloured lip, but depreciated in the strap-form of its segments. In addition was a fine grown and flowered piece of *Odontoglossum Coradinii* Waltonense (Award of Merit). This is a much broader-limbed flower than the normal form, suggesting natural hybridisation; the lip is panduriform; the spike had fifteen superb flowers on it. Mr. STEVENS also put forward a *Cattleya Rex* of striking

colour, greenish-white, with the convolute division of lip of saffron colour, quite a departure from the normal type; as it was only shown as a cut flower, it received no award.

Mr. W. A. GENT, Brooklands, put up a small healthy piece of *Brassavola Digbyana*, with a single flower, which the committee requested to be brought up again. The lip had an unusually deep fringe. HUGH LOW & Co., Clapton, had *Cypripedium* × Mrs. E. V. Low (Award of Merit). The parentage was *C. niveum*, with another unknown. Judged by the white ground standard, with the ruby spotting and the form of the segments, it partook of the same character as *C. insignis*, and the lip resembles that of *C. niveum*, and the leaves indicate the *insignis* type. The two committees (London and Manchester) took the same view as to its intrinsic merits (see *Gardener's Chronicle*, p. 10, col. c).

A. WARBURTON, Esq., Vine Lodge, Haslingden (Mr. Tom Lofthouse, gr.), exhibited the choicest lot of the day, viz., *Cattleya tenebrosa* Victor Warburton (First-class Certificate). The well-formed segments are self-coloured, of a captivating pale shade of saffron, with a roundly ovate entire lip, rich purple towards the orifice of the tube, with the lines shading out to the base of the column, and running from the solid blotch towards the extremity of the blade, stopping short at the margin, which is white—altogether a pretty combination. The next most important plant was *Cattleya Mossii* bellissima (First-class Certificate), an albino of fine form and good substance, the limbs pure white, the lip with a fine dash of yellow distributed up to the column base, and that rests on a white ground colour, the only drawback to the flower being a slight semblance of flushing at the front of the lip. The same exhibitor had *Cattleya Mossii* Reineckiana (Award of Merit), with six fine flowers in true character. The lip has fine stencillings of rosy-purple, and the yellow stained orifice adds to its merits. Another albino of the *Mossii* type, named Warburtoni, received an Award of Merit.

WALTER C. CLARKE, Esq., Sefton Park, Liverpool, exhibited *Cypripedium* × *Lawreli* (Award of Merit). This is one of the best of the bellulatum section, with its peduncle elongated, and showing the brilliant admixture of colour of the famed Lawrenceanum much more pronounced, in having black orbicular spots. It was a little past its best, or it might have fared better, as being shown here for the first time. The same grower had also *Cattleya gigas* Sanderiana, with a crowd of brilliant flowers on it.

THOMAS STATTER, Esq., Stand Hall (Mr. R. Johnson, gr.), had a finely-grown piece of *Cattleya gigas*, with very large flowers (Award of Merit). The white eyes at the orifice, with the fine crimson-purple on the lip, solid from base to extremity, makes this one of the champion *Cattleyas* in our whole list. The same exhibitor had *Laelio-Cattleya Hippolyte* (Award of Merit). The colour of this hybrid (Nankin-yellow) makes it a pleasing addition to our list of real hybrids, possessing both desirable colour and form.

G. SHORLAND BALL, Esq. (gr. Mr. A. Hay), had several good things, the best being *Cypripedium Harrisoni* superbum (Award of Merit). This is an improvement in form and colour, and is one of the best of the novelties. Another pretty and distinct flower was *Cypripedium Curtisi* viride.

SAMUEL GRATRIX, Esq., Whalley Grange (gr. Mr. R. McLeod), showed a well-cultivated plant, bearing four extra fine flowers, of *Cypripedium grande atratum* (Award of Merit). In size, substance, and beauty of colour of the flowers, it excels the normal form; the dorsal and inferior sepals are of shaded bronzy-green, with bold roseate lines, while the linear petals, much elongated, are of greenish cast, distinctly edged with claret, and adorned with glandular hairs; the pouch is ruby, with a highly ornamental interior of white spots and blotches, interspersed with carmine; and the long pedicels springing from the peduncle make this a most effective and distinct *Lady's-allipier*.

HARRY GREENWOOD, Esq., Highfield (gr. Mr. Spurr), showed a finely cultivated plant of *Cypripedium Elliottianum*, possessing two spikes, each three flowered, resembling *C. Rothschildianum*—Indeed, there is no difference between them. As the committee has had *Rothschildianum* before them it was decided to give a Cultural Commendation to this plant. A form of *Dendrobium* from New Guinea was shown from this exhibitor, it was dwarfier in habit than *D. superbiens*, and relegated as *Gouldianum*. It is more interesting than beautiful.

Messrs. CHARLESWORTH & Co., Heaton, put up a new hybrid *Cattleya* under the name of *velutina-elegans*. It is a good gain, as showing the intermixture of *granulosa* and *Laelia elegans*. The segments are purely those of *C. granulosa*, but the blade of the lip is coloured like that of *elegans*, and shows the broken outline of that choice species; it has four good flowers on it. It was voted an Award of Merit. It ought to be christened *Laelio-Cattleya velutina elegans*.

Messrs. COWAN & Co., Garston, had several plants; the best flowers (not on the plant, however) were a *Cattleya Mossii*, called Wagneri, but the slight pink flushing on the lip barred that name; the yellow was grandly in evidence. The plant of *Cattleya Warneri* was very brilliant, but it was past its best.

Archdeacon RAWSTONE sent a good *Cattleya Mossii*; D. GILMORE, Esq., sent *C. Mossii* chrysotoxa, and Captain SCHOFFIELD an extra bloom of the beautiful *Laelio-Cattleya eximia*.

TORQUAY ROSE DAY.

JULY 1.—The tenth annual Rose show, in aid of the Torquay and District Gardeners' relief Fund, was held on the above date in Messrs. CURTIS Sanford & Co.'s nursery, Torquay. Considering the excellence of the season, the

display of Roses for competition was hardly so good as might have been anticipated, but in the generality of cases the show was a week or ten days too late for amateurs.

The competition in the classes for groups of plants was poor. The miscellaneous cut flowers, particularly Carnations, were decidedly good. Table decorations were pretty, and light, and the competition showed a welcome increase on previous years. A feature of the show was, however, the large exhibition of cut Roses by Messrs. CURTIS, SANFORD & Co. They also made a display of various fruits from their fruit farm, and threw open their grounds, &c., to the public.

Messrs. VEITCH & SON, of Exeter, showed a new red-flowering hardy Cactus from Colorado, the first introduced into Great Britain; hardy Water Lilies, a new yellow hardy Honeysuckle, Bamboos, &c.

LEEDS FLOWER SHOW AND GALA.

JULY 7, 8, 9.—An attractive horticultural show was held in the Headingley Athletic Grounds, Leeds, on the above dates. The show has lapsed for several years, but was revived with considerable success on this occasion. The groups arranged for effect were excellent from every point of view. Mr. J. S. SHARP, gr., Almondbury, being 1st, and Messrs. R. SIMPSON & SON, 2nd. Collections of fruit were well shown by Mr. Edmonds, gr. to the Duke of St. ALBANS, Bestwood Park, Nottingham, 1st, and Mr. McIndoe, gr. to Sir J. W. PEASE, Bart., Hutton Hall, Guisborough, 2nd. The fruits of James Veitch Strawberry shown by Mr. Edmonds were especially fine examples.

Obituary.

MR. W. K. WOODCOCK, of Victoria Nurseries, Leicester, and for several years horticultural instructor for the Norfolk County Council, died at his residence on Friday, the 2nd inst., and was interred in Leicester Cemetery on Tuesday last. The deceased was much esteemed by all who knew him for his courteous demeanour, and uprightness of character. All the principal nurserymen and florists of Leicester, and other friends, followed his remains to their last resting-place.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 45° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grain, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

FLOWERS IN SEASON.—We have recently received from Messrs. J. Veitch & Sons, Ltd., Chelsea, two shoots and flowers of *Magnolia macrophylla*, taken from a plant growing in their Coombe Wood Nursery. Although introduced in the early part of the century, and flowered by Mr. James Vere in 1821, from whose plant a figure was prepared for the *Botanical Magazine* (see fig. 2189), the plant is not common in gardens. The leaves measure from 1 to 2 feet in length; and the flowers, which are white, are correspondingly large.

TRADE NOTICE.

We are informed that the business carried on for the past fifteen years, and known as "Eladon & Co.," the Vineeries, Milton, under the management of Mr. Thomas Eladon, will henceforth be known as "The Milton Nurseries," and will be under the sole management of Mr. William Willson.

ASPARAGUS PLUMOSUS: *G. P.* We have grown this plant in a vinery-border with success, but the best growers employ peat of good quality mixed with sand, in the proportion of one-sixteenth. This, we would remind you, is very different to sandy-peat, which is mostly a hungry kind of soil. In summer, the plant should be afforded cool stove treatment, and be shaded for a time after re-potting.

BEGONIA BLOSSOMS: *J. T.* An exceedingly fine variety of pleasing colour—worth preserving.

BOOKS: *J. K.* You will find all that you require in *Greenhouse and Stove Plants*, by T. Baines (London: John Murray).—*Fruit Farming:* *J. S.* Manuals dealing with the subject have been written in recent years by the following nurserymen, Mr. G. Bunyard, Maidstone; Mr. J. Cheal, Lowfield, Crawley; and Mr. Cranston, Hereford.

FREESIA BULBS: *H. F.* Any of the larger nurserymen, seedsmen, or florists, will supply them.

GALANTHUS (LATIFOLIUS): *J. P.* It is a variety of *Galanthus nivalis*, the common Snowdrop.

GREEN PEAS TO BOTTLE: *A. H.* Shell the Peas, put them into dry, wide-mouthed bottles, and shake them together, so that they may lie in as little space as possible. Cork the bottles closely, and seal the corks. Bury the bottles in the driest part of the garden, and take them up as they are wanted. They will keep good five or six months. Another way: Choose Peas which are large and fully grown, though not old. Put them into bottles, cork securely, and cover with bladder. Tie a wisp of hay round the lower part of the bottles, to prevent their knocking against each other in the pan. Put them side by side in a large saucepan, and pour into it as much cold water as will reach to their necks. Put the saucepan on the fire, and let it remain for two hours after the water has reached the boiling-point, then take it off, but do not remove the bottles until the water is cold. Seal the corks, and store in a dry place.

HERBACEOUS BORDER: *S. W.* Better is it than a mere list, which to those unacquainted with plants consists of names and nothing else, to visit a nursery where such plants are grown, and make a selection of those which please you at this season and during August, September, and October. Earlier than the present there bloom *Lilium dauricum*, great number of Irises of different sections of this lovely genus, *Narcissus* in great variety, *Paeonies*, *Iberis*, dwarf *Phloxes*, *Primulas*, *Violas*, numerous alpine plants, &c. Many species of herbaceous perennials increase fast in good well-trenched soil, and should not be planted at a less distance than 4 feet from their neighbours. The nurseryman would supply height, and probably size of the masses when at two to four years old. The spaces between plants of small annual growth may be 2 to 3 feet, and the smallest species may be planted at 1 to 1½ foot apart. Bulbs of *Narcissus*, *Lilies*, *Tulips*, *Hyacinths*, *Squills* (*Scilla*) of

all kinds, *Crocus*, *Chionodoxa*, *Ornithogalum*, *Watsonias*, *Colchicums*, &c., should be grouped among the other plants distant from the front of the border according to the height to which they grow.

LAND TAX EXEMPTIONS: *F. C. J.* You should obtain a copy of the Finance Act of 1896 from Messrs. Eyre & Spottiswoode, East Harding Street, E.C. (it costs but a few pence), and of the Memorandum prepared under the authority of the Board of Trade, 4, Whitehall Place, S.W. (which may be had gratis). You will then be in a better position for ascertaining the point you wish to clear up.

LILIAM BULBS DECAYED, &c.: *S.* *The Oaks.* Matters have now become so complicated, that it is impossible to say what was the first cause of the deterioration of the bulbs. There are fungus and many species of worms, and also the bulb-mite. We should throw all similar bulbs away, and plant afresh in well-drained, porous soil, free from fresh manure of any kind. This tuberose produces side-shoots in this case, because it has lost the centre one.

MELON FOLIAGE SPOTTED: *J. L.* The spotting of the leaves of Melon does not arise from any organic disease, but has been caused by some external circumstance. It is not likely to affect the fruit, or the general health of the plant. The soil would not appear to have had anything to do with it.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*H. K.* *Dendrobium macrostachyum*, and *Oncidium pumilum*. *H. K.* *Stanhopea inodora*.—*Foreman.* 1 and 3, varieties of *Cattleya Mendeli*, the former a very pretty white-petalled form; 2, *Cattleya Mossiae*, of the class commonly called "poor varieties."—*E. M.* *Linaria repens* (striata).—*East Norfolk.* Pink-flowered, *Spiraea Douglasii*; white, *S. arifolia*.—*J. W.* 1, *Cassia fulvida*; 2, *Indigofera decora*; 3, *Abies Pindrow*.—*Asplenium*. *Collomia linearis*, an annual; the Fern is *Lastrea serrata*.—*G. S.* *Carduus eriophorus* (Woolly Thistle).—*Constant Reader.* 1, *Forsythia suspensa*; 2, *Choisya ternata*; 3, *Combretum purpureum*; 4, *Phyllanthus nivosus*; 5, *Selaginella Martensii*; 6, *Corydalis lutea*.—*R. S. J.* 1, *Rhamnus alaternus*; 2, *Spiraea callosa*; 3, *Zenobia speciosa*; 4, *Veronica spicata*.

NAPHTHALENE EMULSION: *F. J. T.* For the methods of making and using this new sort of plant-dressing, you would do well to enquire of the principal of the South Eastern Agricultural College, Wye, near Ashford, Kent. See also paragraph on p. 8 of the last week's issue of the *Gardeners' Chronicle*.

ORCHID LEAVES TURNING BLACK: *J. H.* The leaves of Brazilian *Cattleyas* and *Laelias* are often affected in the manner shown in the specimens sent by you, in consequence of being kept too close, and in a too moist atmosphere after growth is completed. Or sometimes they may be caused to turn black by being caught by the rays of the sun.

PEACH CASTING ITS FRUIT: *W. C. G.* Probably a case of over-cropping, or at the least leaving more fruits than the tree can mature—hence it casts them off. One fruit to a square of 9 inches is close enough for a vigorous tree, and one per square foot for weakly trees, or when very large fruits are desired.

PEACHES, THE DECAY OF THE FRUITS EACH YEAR: *A. T. W.* The disease is caused by *Monilia fructigena*, a fungus whose presence shows itself in circular whitish or yellowish cushions on the surface of the fruit, which rapidly enlarge, and set up decay in the pulp. Another year you should remove the whole of the surface-soil to a depth of 3 inches, and whitewash the walls of the house, taking care to put a handful of flowers-of-sulphur into the wash. Use the Bordeaux Mixture on the trees when the fruits are stoned, and twice afterwards, also after the fruit is gathered.

PHYSALIS PERUVIANA: *J. E.* This plant has no other name excepting Cape Gooseberry, which it derived from the fact that it is cultivated at the Cape, as in many other warm countries. There is a yellow edible-fruited variety, *P. p. edulis*, syn. *Physalis edulis*.

SCOTS FIR DYING: *H. G.* There is nothing apparent to account for the death of the plants, but the position being an exposed one, they may have succumbed owing to their being too large when planted, and from being raised in a warm sheltered nursery.

The plant sent was ill-found in roots, and if all of the plants were like it, their chances of living were poor.

STRAWBERRIES: *G. P. H.* The Strawberries reached us in a deplorable condition, covered with a superficial mould, which was an after-product; otherwise we discover no actual infection of the fruit, and no fungus disease. We are inclined to the belief that the cause is a purely local one, and is due to external circumstances, which we cannot infer from the fruits themselves. There is something wrong in the surroundings, and not in the plants themselves, as is evident from the luxuriant foliage. *M. C. C.*—*Dr. K.*, and *P. S. C.*, *Wimbledon.* The plants are attacked by a fungus, *Botrytis vulgaris*. See reply to "*C. T. Slough*," in our last issue, p. 12, col. 1.

STRAWBERRY FRUITS DISEASED: *L. C.* Affected by *Botrytis vulgaris*; see *Gardeners' Chronicle*, last week's issue, p. 12, under initials "*C. T.*"

STRAWBERRIES SPOILED: *X.* The beetle sent is *Harpalus ruficornis*. See answer to "*A. G.*," p. 12 in our last issue.

THUJA GIGANTEA: *W. T.* The plant was shown under the name of *T. gigantea*, a name common in gardens. *T. Lobbi* is another name for it, but the true name is *T. plicata* (not of gardens); and *Libocedrus decurrens* was also once erroneously called *T. gigantea*. The former is from British Columbia, the latter from California. There are variegated garden forms of each. Whether the synonym was attached to the plant shown, our recollection does not serve us.

TOMATOS: *S. A.* There are no signs of the ordinary Tomato-mould on your plants. They appear to be suffering from something wrong in the treatment, and not from any organic disease. If the *Sclerotium* (referred to in a previous number) has anything to do with it, which is probable, it is not far enough advanced to be determined. The marks on the stems, and the discoloured tissue are suspicious of this disease in an early stage. *M. C. C.*

TOMATOS DISEASED: *H. P.*, *Frystone.* *Cladosporium lycopersici*, see *Gardeners' Chronicle*, last week's issue, p. 12; and figured at p. 533, vol. ii. for 1887.

VINES EXUDING SAP ON HOT DAYS: *H. A. C.* We suppose the very powerful upward flow of the sap owing to rapid evaporation from the leaves, is the cause, the pressure forcing some of it through the bark. If you could reduce the warmth of the house by ventilation, or the use of a thin shade over the Vines during the hottest hours, the flow of sap would be lessened, and no exudation occur. It is not likely to be followed by bad consequences to the Vines.

VINES WITH WARTY FOLIAGE: *G. G.* The warts are due to too great humidity in the air of the vinery; or, putting it in another way, to deficient ventilation. The warts do no harm, and the leaves are otherwise healthy.

CONTINUED LARGE INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "*Gardeners' Chronicle*" has, since the reduction in the price of the paper,

Increased to the extent of more than 90 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "*Chronicle*" circulates among

COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS

AND GARDEN-LOVERS at home, that it has a specially large

FOREIGN AND COLONIAL CIRCULATION, and that it is

preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle.

SATURDAY, JULY 17, 1897.

VEITCH MEDALLISTS OF 1897.

THE following awards of Medals of Honour have been made by the Veitch Trustees. Circumstances have this year prevented the attendance of the recipients in person, and the Medals have accordingly been sent to them.

NORMAN C. COOKSON in recognition of his great success in the hybridisation of Orchids. Among the earlier acquisitions, mention may be made of *Cypripedium Io*, *C. Godseffianum*, *C. nitidissimum*, and *C. Sanderæ superbien*, still highly appreciated. Besides these, some of the finest hybrid *Cypripedium*s obtained by other operators as *C. Calypso*, *C. Morganæ*, *C. cardinale*, *C. Niobe*, have been raised by him from the same pairs of species, and have very properly received the same names. In other genera he has obtained *Calanthe Cooksoni*, *Cattleya William Murray*, *Lælio-Cattleya Phoebe*, *Dendrobium Venus*, *D. Owenianum*, *Masdevallia Courtauldiana*, all hybrids of great merit. With these may be grouped *Phaius Cooksoni*, a plant of exceptional interest, on account of its being the first hybrid *Phaius* in which the remarkable Madagascar species *P. tuberculatus* has participated in the parentage. Among later acquisitions *Cypripedium Bryani*, *Lælio-Cattleya Doris*, *Dendrobium Sybil*, and *Phaius Cooksoniæ*, are beautiful hybrids, but especial prominence must be given to *Odontoglossum crispum-Halli*, one of the most remarkable of artificially-raised *Odontoglossum*s; and scarcely less interesting is the confirmation of the supposed parentage of *Cattleya Hardyana*. The hybrids raised by Mr. Cookson include a large range of subjects, and will bear enduring testimony of his horticultural skill.

MARTIN R. SMITH, in recognition of his great success in improving the garden Carnation. This success is the more remarkable from the fact that when Mr. Smith took up the subject he began to work in a field in which great results had been already obtained, especially by the late Charles Turner and Ephraim Dodwell, besides other cultivators of this popular flower, when further improvement seemed well nigh unattainable. It is well known among amateurs of the Carnation, that of the numerous seedlings raised annually, very few retain a permanent place in collections. A glance through the groups into which florists have distributed the different forms and colours, shows that some of Mr. Smith's seedlings possess qualities that will make them exceptions to the general rule, especially in the group known as Malmaison Carnations. In this group Mr. Smith's acquisitions are particularly valuable, not only to amateurs, but to horticulturists generally.

CHARLES NAUDIN, for distinguished services to botany and horticulture. He is one of the most eminent French botanists of the present

time, and has been for upwards of thirty years a member of the Académie des Sciences, the most important scientific body in France. He began his scientific career in the Jardin des Plantes, where he soon gained distinction by his accurate investigation of the subjects submitted to him. Among these were numerous experiments to determine the nature and validity of species, including the determination of the many cultivated varieties of the Gourd and Pumpkin. By carefully growing the numerous kinds side by side, by comparing one with the other, and by crossing or attempting to cross one with the other, he eventually succeeded in tracing all the edible and most of the ornamental forms to *Cucurbita Pepo*, *C. maxima*, and *C. moschata*. While connected with the Jardin des Plantes, he collaborated with Professor Decaisne a general treatise on horticulture, entitled *Manuel de l'Amateur des Jardins*, still the most scientific and best illustrated work on gardening in the French language. Failing health obliging him to leave the Jardin des Plantes about the year 1870, after passing some years in experimental horticulture at Collioures, he accepted the directorship of the Villa Thuret garden, established by M. Gustav Thuret and Dr. Bornet at Antibes, as a botanic garden for experiments in the acclimatisation of subtropical plants. The villa and garden are now the property of the French Government, and form a sort of southern branch of the Jardin des Plantes, under the direction of M. Naudin, in which are cultivated Australian, South African, and many other subtropical plants, for distribution among the French colonies, and for the use of the Universities of France. Since his instalment at the Villa Thuret, M. Naudin has published a valuable *Manuel de l'Acclimateur*, in which the author's extensive knowledge of the large and difficult genera *Acacia* and *Eucalyptus* is conspicuously shown.

MAX. LEICHTLIN, in recognition of eminent services to horticulture, especially the introduction of many new and beautiful plants. Herr. Max. Leichtlin occupies a unique place among the horticulturists of the present day. Apprenticed to a gardener in his youth, he subsequently held situations in several places, but finally settled down at Baden-Baden, where he founded a private Botanic Garden, which has since become a household word wherever rare and beautiful species of bulbous and perennial herbaceous plants are prized. In this remarkable garden, scarcely half an acre in extent, Max. Leichtlin has worked for upwards of forty years, with the assistance of only one or two skilled labourers. During this period, remote corners of the earth have been searched for plant rarities; and when once these treasures have found a home in the little garden at Baden-Baden, the skill of the owner has rarely failed to make them available for the gardens of Europe.

To enumerate the many plants introduced by Max. Leichtlin would require a very large page of letter-press; but to show how cosmopolitan his operations have been, a few representative instances should be noted. Thus, among his introductions we have *Anemone blanda* from Armenia, *Colchicum Szowowitzii* from Persia, *Bomarea oligantha* from Colombia (S. America), *Calochortus Leichtlini* from California, *Eremurus robustus* and *Ostrowskya magnifica* from Central Asia, this last the grandest of all Bell-flowers; *Galanthus Regine Olge* from Greece, *Glaudiolus platyphyllus* and other species of *Glaudiolus* from South Africa,

Kniphofia comosa from Abyssinia, *Leucocoryne purpurea* from Chili, *Meconopsis racemosa* from China, *Olearia insignis* from New Zealand, *Tigridia Van Houttei* from Mexico, and many more, forming a surprising record for one man. Besides all these, many beautiful forms have been raised in the Baden-Baden garden by hybridisation and selection, as the *Kniphofia* hybrids, *Præonia Moutan* varieties, *Clematis coccinea major*, *Crococsmia aurea imperialis*, *Aubrieta deltoidea Leichtlini*, and many more.

The plan adopted for the cultivation of so large a number of species within so small a space is a very simple one. As soon as new plants and bulbs have been proved and multiplied, they are distributed among the gardens of the world, and room is made for new introductions. Novelty and change are the predominant features of the Baden-Baden garden; the occupants of it at one epoch disappear within a short period afterwards.

Professor L. H. BAILEY, for eminent services to horticulture. As Professor of Horticulture in the Cornell University in the State of New York, Mr. Bailey has laboured earnestly to promote the science and practice of horticulture in the United States in various directions. This he has done primarily by lectures in which he has brought before his audiences, usually consisting of farmers and others engaged in the manual work of cultivation, the more important facts in plant physiology, which are apt to be over-looked by ordinary workers, besides other illustrations of plant-life, some knowledge of which is indispensable to those engaged in gardening and agriculture. He has done essentially good work in teaching and illustrating the use of insecticides, in investigating the origin of plant-diseases, and experimenting on the means of arresting them, especially in fruit-trees, in which he has rendered valuable service to the fruit-growers of America. He is one of the most prolific writers on applied botany in the United States; the numerous year-books on horticulture, and the useful *bulletins* issued by the Agricultural Station connected with the Cornell University, bear ample testimony to his great activity in disseminating useful knowledge, whether derived immediately from his own observations and experiments, or from the publications of others. He has published several important scientific works, among the latest of which is one entitled *The Survival of the Unlike*, a collection of evolution essays, suggested by the study of domesticated plants.

NEW OR NOTEWORTHY PLANTS.

EPIDENDRUM STANHOPEANUM, Krzl. (Amphiglottium Holochila).*

COLUMBIAN Andes, Ocaña, leg. Oscar Stanhope. Stems short, 8 to 10 cm. high, leaves distichous, ovate, green, with large transverse stripes or blotches

* *Epidendrum Stanhopeanum*, Krzl., n. sp. (Amphiglottium Holochila).—Caulibus subcapitibus ad 10 cm. altis; foliis 8–10, distichis ovatis (infima late-ovatis) obtusis antice minute papilloso-serrulatis, cartilagineis, ad 2.5 cm. longis, vix 1 cm. latis, vittis transversis purpureis ornatis (?), vagina ampla ochrea tenera petaloides pallide viridi-rosea (!) in ipsa basi racemi; racemo brevi paucifloro (–4), bracteis ovatis acutis quam ovaria multoties brevioribus; sepalis dorsali lineari-ligulato acuto, acuminata, lateralibus lanceolatis subobliquis; petalis lineari-oblongis apice papululorum latioribus, labello integro profundo cordato reniformi antice rotundato margine minutissime (sub lente) denticulato, disco omnino glabro, basi ipsa labelli sub fovea stigmatica incrassata; gynostemio pallidius marginato, osterium generis. Sepala petalorum 1.3 cm. longa, sepalum later. 5 mm. lata, labello 1 cm. longum, 1.5 cm. latum. Omnes floris partes necnon spatha virides roseo suffusæ, labello intensius roseo punctatum. F. Krzl. in.

of (as far as we can judge from Mr. Stanhope's drawing), a somewhat dirty purple. At the base of the short few-flowered raceme is a very peculiar sheath of weaker and evidently rather tender consistence. The three or four flowers are about 2.5 cm. across, the lip is deeply cordate, reniform or nearly half-circular in its circuit, with very minute toothlets around its border; the petals are linear, the lateral sepals narrow, oblong, or nearly lanceolate and oblique. The colour of the flower is light green, with a rosy-purplish hue, and some deeper spots on the lip; the sheath of the raceme has the same colour, but the green prevails. If I add that the apex of the leaves is minutely but sharply toothed, all characters of some value are enumerated. It is extremely difficult to day to determine *Epidendrum*, the literature being dispersed to the utmost degree, and with great hesitation I add this species to the crowd of more or less known and partly phantom-like species. I hope, too, that in a short time we may have the plant living in Europe. Mr. Stanhope gathered the plant in the remote surroundings of Ocaña, and sent me a good sketch in water colours, and two dried specimens.

The plant is far from being what we may call a beauty, but a dense cluster of the little stems with the marbled leaves will certainly make a good effect. The short racemes are clothed at the base by a large scale or sheath of about the same colour as the flowers, a character not very frequent in *Epidendrum*, the leaves, too, are toothed at their apex, also a good not very frequent character. The plant belongs undoubtedly to the affinity of *Epidendrum carinatum*, Lindl., *miserrimum*, Lindl., a group of little and mostly inconspicuous plants of merely botanical interest, and among those it may be considered as the best of them all. *P. Kränzl.*

NOTES FROM MENTMORE.

THIS, the Buckinghamshire residence of the Earl of Rosebery, has always had an interest for gardeners and those interested in horticulture, and especially in that which affects the fruit-growing industry, viz., the cultivation of the Apple, Plum, and Strawberry, but more especially the second named, so no experimental planting on an extensive scale having been instituted at Mentmore about twenty years ago. These orchards were, we believe, laid down by Mr. J. Smith, who was his gardener then as also at the present time. These plantations of Plums cover an area of about 200 acres. The produce from the orchards is in some years very heavy, and being graded to suit the requirements of the markets, it finds a ready sale at very remunerative prices. The soil is by no means everywhere of good quality, it being in parts a thin and infertile clay that cannot support a fruit tree for any length of time without considerable additions in the form of compost, dung, or other plant-foods. At the best, a Plum is not a profitable tree after twenty years' cropping, more especially if planted in grassed orchards as here; and we noted new plantations of this kind of fruit, intended, apparently, to take the place of the earlier ones, as these in the course of a few more years cease to be profitable.

A visit to the kitchen garden showed us that Mr. Smith still holds to his fancy for growing numbers of the finest varieties of Strawberries, which are kept till such time as he has thoroughly tested them in regard to their cropping capabilities, flavour, fitness for packing and travelling, forcing, and general appearance. The first variety shown us was, as belittled the time—Jubilee week—that showy fruit, Royal Sovereign, and an extraordinary crop it was, too. Alongside of it grew Noble (Laxton's), the fruit of which was fit for the table simultaneously with the first-named. Its crop was enormous, but as regards the flavour of the fruit, it must be said that it was flat and insipid as compared with Royal Sovereign, itself a fruit not particularly rich in flavour. A great number of the fruits of this last-named variety were of a wedge shape, but generally they resemble those of Sir Joseph Paxton, of which it is either a seedling or a

selection. Monarch is another large-fruited Strawberry, with a glazed surface, and prominent seeds, a form of fruit usually betokening firmness and suitability for market purposes. The fruits are often wedge shaped, and the plant crops heavily, but less than Royal Sovereign. It is a variety that is likely to find favour with gardeners and market-growers, as it has with Mr. Smith—that is, till, in its turn, it is superseded by something better.

A variety which crops heavily, but has soft pulp, sunken seeds, and a pale red colour, is Leader. The fruits are large, but the flavour has, however, nothing to recommend it as a variety for general cultivation. The old favourite variety, Keen's Seedling, although well grown, was a pigmy among these giants, but in flavour it was surpassed by none. Of late varieties, we were pleased to find the following still grown: Elton Pine, Alice Maud, Waterloo, and Late-of-All, all looking much alike at that date. If a Strawberry is considered to be worth cultivating it is not destroyed till the third year, that is, three crops of fruit are taken. The runners, taken early, are simply layered in restricted numbers per plant on the soil, no regard being taken whether a runner is the first or the second reckoned from the mother-plant. This method entails little or no labour spent in watering; the roots do not get coiled up in a small space, as will happen when the layering is done in 60's, but their roots radiate all round the ball, ready to seize upon the soil as soon as planted. The planting is done in July or the first week in August, a small crop is taken the first season, and usually heavy crops the two following seasons. There is thus a good breadth of Strawberry-land set free each year which comes in excellently well for Broccoli planted à la Richard Gilbert.

The exploration of the garden in search of Strawberries brought the principal crops of vegetables within ken. Of Peas mention may be made of Chelsea Gem, which was cropping very heavily. William I., which some gardeners no longer grow, is much liked, it being very prolific, and turning in in about ten weeks from time of sowing, than which there is no earlier Pea. Mr. Smith does not altogether favour those varieties of Peas that possess large haulm, and believes that, speaking generally, they are excelled in flavour by some of the older and smaller-growing varieties.

The variety of Cauliflower, Early London, is much liked here, than which there is none better when it can be obtained true, the curd being snow-white, well protected by the in-growing leaves, and mild flavoured.

The true and even-looking haulm of the various Potato patches would have charmed even an Irishman. Snowdrop (Perkins) claims to be the best-flavoured Potato grown, as it certainly is a good cropper. The stock of it seemed absolutely true—no small achievement where so many varieties are grown as here. Sutton's Supreme, a variety raised by the late Mr. Clarke, and introduced in 1893; Harbinger (Sutton), Up-to-Date, and Sharpe's Victor, received a word of commendation from the gardener. He showed us a fine strain of that excellent main-crop variety, Sutton's Triumph, first sent out in 1892; in form, the tuber resembles the Fluke. Among the earlies were noted Early Puritan, of American origin, a flattish round tuber, cropping heavily and ripening early; Veitch's Rivers', Royal, and Myatt's Ashleaf, the last-named being rather the later of them all, so that it forms a succession to them. One which is said to almost equal Snowdrop is Epicure's Delight, a piece of which was pointed out to us. Windsor Castle (Sutton's) was said to be the finest round Potato in cultivation. It is a heavy cropper, a good disease resister, of a handsome pebble shape, and when boiled the flesh is white and floury; it is what is known as a second early variety.

In the Apple quarters, the trees are in bush form; and those varieties which withstood the frosty easterly winds of the past spring on a fully-exposed site are Ecklinville, Lane's Prince Albert, and Stirling Castle, all of which are bearing abundantly. Keewick Codlin has a heavy crop. This old sure-cropping variety,

coming into use for cooking purposes before any other, is too often discarded now-a-days for much poorer cropping ones. Newton Wonder is a new Apple that is cropping well this season. Two long lines of Cox's Orange Pippin backed by a line of King of the Pippins, looked well. Calville Boisdun was a good crop—young bushes on dwarfing stock, likewise Gascoign's Scarlet. An Apple well spoken of by Mr. Smith is White Transparent; and of Duches's Favourite, a large lot of dwarf bushes were remarked. Seaton House is another sort of Apple that always bears heavily, making it just the one for the allottee or cottager; this and Worcester Pearmain and Keewick Codlin have good crops in most years. That fine late plum, Cox's Golden Drop, is extensively planted; for does it not fetch rare prices in the market—in fact, no other sells so well. Market growers in perspective should note this. A break of Pears was observed, which consists of trees of the following varieties, Marie Louise, Monarch, Easter Buerre, and some few others of our finest Pears, besides rows of the Catillac.

A march through the vinerias and other fruit-houses revealed some fine crops of Dr. Hogg Grape in the latest house; in another, excellent crops of Lady Downes, Lady Hutt, Appley Towers, Gros Maroc, and Mrs. Pince. In one vinery, the varieties Foster's Seedling, Madresfield Court were approaching ripeness. The earlier houses had either been cleared of their crops wholly or in part.

There are several Peach-houses, and we were informed that extensive additions were to be made shortly to the fruit-houses, including houses for Figs, Plums, Cherries, Vines, &c., so that the glass appurtenances of Mentmore will in the course of a year or two be very complete; and as regards the fruit-houses, they will be brought together as they should be—in the fruit-garden.

The plant-houses were in excellent trim, but time being short, only a cursory glance could be afforded them.

THE CORYANTHES.

THE members of this extraordinary section of the Stanhopea tribe, which are found rather widely distributed in tropical America, have been known to science for upwards of three-quarters of a century. Although the plants have remained uncommon, the limited number of them which have flowered in gardens have caused more wonder and admiration by reason of the extraordinary structure and general dissimilarity to other flowers than have any of the showier and more popular species and genera. Every portion of the floral structure in *Coryanthes* affords proof of the correctness of the theory that Orchid fertilisation is brought about by insect agency, and what was conjectured from a study of the plants under cultivation has been fully substantiated by such careful observers as Dr. Griseb., formerly Director of the Botanic Gardens, Trinidad; Mr. J. Rodway, F.L.S., and others, whose investigations were published in former issues of this journal.

The *Coryanthes* are strictly epiphytal, and it was noted by importers that the specimens obtained by collectors were mere tufts of pseudo-bulbs proceeding from long oval masses of roots, and with scarcely a particle of moss or other substance or growth about them. These suspended masses were, according to the collectors, the homes of innumerable ants, and it was even asserted that the presence of the ants was essential to the well-being of the *Coryanthes*. This, however, as Mr. Rodway explained, is only another of Nature's wise provisions—the masked root-growth of the plant supplies a congenial home for the ants, who in return attack the numerous other insects which would injure the plants, and thus in exchange for lodgings give protection.

Our illustrations of *Coryanthes Feildingii* (figs. 7, 8), one of the oldest but still one of the most rare species, will indicate the size that the flowers of most of the *Coryanthes* attain; while the analytical figure (p. 39) illustrates the method of fertilisation. The structure of the flower is exceedingly strange, and not the least remarkable feature about it is the contrast

between the membranous sepals and petals, and the thick fleshy labellum, the former soon curling back into comparative insignificance, leaving the large and complicated lip as the chief attraction. As soon as the flower expands, a strong and penetrating odour is emitted, and, to quote Dr. Crüger's words, "large humble-bees, noisy and quarrelsome, are attracted at first by the odour; but this probably only gives notice to the insects. The substance they really come for is the interior lining of the labellum, which they gnaw off with great industry. They may be seen in large numbers fighting with each other for a place on the hypochile. Partly by these contests,

with this peculiar appendage, to return nearly immediately to its feast, when it is generally precipitated a second time into the bucket, passing out through the aperture, and so inserting the pollen into the stigma while it forces its way out, and thereby impregnating either the same or another flower. I have often seen this, and sometimes there are so many of these humble-bees assembled that there is a continual procession of them through the passage specified."

The above remarks related to *Coryanthes macrantha*, but they apply equally to other species, and reference to the explanation of the analytical drawing will assist the reader to understand it perfectly. The

FIG. 7.—*CORYANTHES FIELDINGI*: FRONT VIEW OF FLOWER.

(SEE P. 30.)

partly perhaps intoxicated by the substance they are consuming, they tumble down into the bucket (epichile), which is half filled with the fluid secreted by the horn-like organs at the base of the column. They then crawl along the anterior inner side of the bucket, where there is a passage for them. If one is early on the look-out—for these Hymenoptera are early risers—one can see on every flower how fecundation is performed. The humble-bee, in forcing its way out of its involuntary bath, has to exert itself considerably, as the mouth of the epichile and the face of the column fit together exactly, and are very stiff and elastic. The first bee that is immersed will have the gland of the pollen-masses glued to its back. The insect then generally gets through the passage, and comes out

congregating of the insects takes place on the cap above the ribbed mesochile, and the fall of the insect into the bucket, and its passage out, during which the act of fertilisation takes place, is shown by the position of arrows.

The genus was founded by Sir W. J. Hooker in 1831 on *C. maculata*, joining with it *C. speciosa* and *C. macrantha*, which had previously been known as *Gongora*, and at different periods some ten or a dozen other species have been added. The prevailing colours of most of them is yellowish, with crimson and purple markings; though, as in the case of the *C. maculata* vitrina, imported by Messrs. F. Sander & Co., which is wholly greenish-yellow, varieties have appeared in which the coloured marking is suppressed.

A plant of *C. macrantha* flowered recently with

J. H. Kitson, Esq., Elmet Hall, Leeds (gr., Mr. T. Bonnell). A flowering plant of *C. elegantium* was figured under the name of *C. macrantha* in *Gardeners' Chronicle*, May 6, 1882, pp. 593 and 597.

Of comparatively recent introductions, five remarkably beautiful species may be specified, viz., *C. macrocorys*, distinguished by its slender, ungrooved mesochile, and narrow and long hood; *C. leucocorys*, with rich purplish-crimson bucket, and pure white hood; *C. Bungerothii*, a rich yellow-lipped species, spotted inside the lip with bright crimson, and in which the hood is prolonged over the neck-like mesochile, like a cape; *C. Wolfii* and *C. Mastersiana*, both of which are described by Consul F. C. Lehmann as of a new section of *Coryanthes*, with stout, ascending inflorescence, in the *Gardeners' Chronicle*, October 24, 1891, p. 483. The former has flowered in the Royal Botanic Gardens, Glasnevin, Dublin, and proved a very fine species.

Coryanthes, being epiphytal plants, require to be grown under cultivation in baskets, and with no great bulk of material, such as peat or sphagnum-moss around them. During growth an unlimited supply of rain-water should be afforded, and the plants should be placed in a warm, moist, but airy house. After flowering is past, the condition of the Mexican-house is best suited to their needs, but at no period should they be exposed to cool treatment. At the same time there is every reason to believe that the scarcity of the plants in gardens is mainly due to their being kept continually in the same excessively warm, and too often ill-ventilated house. It should be borne in mind that whether growing in hot or cool houses, all Orchids require ventilation. J. O'Brien.

CORYANTHES LEUCOCORYS.

This species well shows the peculiar structure of the genus. A plant is now in flower in the Botanic Garden, Edinburgh, carrying one flower upon the pendulous scape, which springs from the base of the furrowed pseudo-bulbs. They are short-lived; the sepals soon collapse, and, indeed, the whole flower lasts but three or four days. The principal attraction in the flower is, perhaps, the immense helmet-like structure into which the secretion drops—this being of a pale coral-pink, and the ivory hood white. The plant has been grown in an unshaded part of a pit devoted to *Nepenthes*, and in this position it is well suited. A figure of this species is to be seen in *Lindenia*, t. 293; its habitat is Peru. R. L. H.

ORCHID NOTES AND GLEANINGS.

CATTLEYA SCHILLERIANA.

To succeed well with this plant it should be placed in a basket with good fibrous peat and living sphagnum, to which a few lumps of charcoal should be added, or, if preferred, it may be placed upon a block with a little sphagnum. It should be suspended near the glass, at the warmest end of the *Cattleya*-house, but it will require to be shaded from the direct rays of the sun. During the growing season it should, of course, have a copious supply of water at the roots; in winter, however, it will do with much less, although care must be taken not to let the plants shrivel, as this would cause irreparable injury. *Orchid Album*, vol. xi, part 132.

LELIA LINDLEYANA.

To thrive well, this plant should be placed in the cool part of the *Cattleya*-house. It should be potted in a compost of good fibrous peat (from which all the earthy particles have been shaken out) and chopped-up live sphagnum. A few lumps of charcoal added will be beneficial in preventing the compost becoming sour. Care must be taken, above all things, to place an ample supply of draining material at the bottom of the pot, for if this be neglected the plants would stand but a poor chance of obtaining a hold. A liberal supply of water at the roots, as well as occasional syringing overhead, during the growing season, are essential to their well-being. During the resting period the supply of water should be

gradually diminished; at the same time, however, it must be borne in mind that the plant should never be allowed to become absolutely dry, as in that case the pseudo-bulbs would shrivel, and this would cause serious injury to the plant, which it would take years to undo, and in some cases it would even prove fatal. Thrip and scale should also be carefully guarded against, for if these pests once get the upper hand, they cause irreparable injury to the leaves. Steaming with Tobacco-juice, and the use of other fumigating apparatus, will effectually keep these insects in check. *Orchid Album*, vol. xi., part 132.

FLOWER BEDS IN RIVIERA GARDENS.

A PROMINENT feature of the Riviera gardens lies in the wonderful variety of form and colour found in the flower-beds. Such gorgeous displays in the open air, as one sees there, are much appreciated by visitors from our foggy island upon their arrival on the shores of the Mediterranean. In those establishments where the flower gardens must be kept bright during the whole season, that is from November to the end of April, it is necessary to make two almost distinct plantings. Those plants which bedded-out in November, furnish the first display, are supplanted about February by their floral successors. As the season is so short, the majority of the plants are necessarily near the flowering-stage when transferred to the beds.

The primary occupants of the beds are usually Salvias, Daisies, Primulas, Pansies, Solanums, and Carnations. Of *Salvia*, *S. patens* is, I think, the most largely used, and it has a distinct and showy appearance. The Daisies are remarkable for their size and colour; and in these respects they surpass English ones. Of Primulas, although the white and various shades of red are pleasing, by far the most effective are the deep blue ones [?]. These are generally placed in well shaded positions, where their colour is shown off to perfection. The Pansies retain their positions to the end of the season, and by that time they have developed into splendid clumps, covered with numerous fine, large blooms. Here all Pansies are raised from seed sown in pans in the month of June, and placed in some shady spot outside, and when large enough to handle, they are pricked off into *carrés*, i.e., beds prepared somewhat below the level of the ground, so as to retain water. They remain in the *carrés* throughout the summer, and in the autumn are taken up for planting as required.

Carnations are generally grown from cuttings, taken off early in January, and put into prepared *carrés* for the summer months; and any flower-buds which may appear during this time are pinched off, with the result that the plants develop a bushy habit of growth. Under this method of culture they bloom profusely the following winter. One very ornamental little plant often seen in beds is *Solanum ciliatum* var. *macrocarpum*. It is raised from seed sown in July or August, and cultivated in pots. As many as twelve or fourteen bright orange-red coloured fruits are produced by each plant. *Solanum capsicastrum* is also bedded-out, and when well berried it is a very attractive plant. The above-mentioned plants are followed by *Cinerarias*, *Freeseas*, *Ranunculus*, *Anemones*, *Hyacinths*, *Tulips*, &c.

The *Cinerarias* form the most gorgeous beds of all. It is rather difficult to grow them successfully in this district, owing to the great heat of the summer; and they have to be grown in pots in the shadiest place that can be found for them until the approach of inclement weather, when they are removed to cold-frames. As signs of flowering become apparent, they are gradually inured to the rays of the sun, so that when the time arrives for planting, they are quite hardened off. Sometimes as many as 600 plants, comprising an endless variety of colours, are put into one bed, the effect of which may be better imagined than described. As an experiment, several small beds at the Royal Gardens, Frogmore, were filled with *Cine-*

arias last spring, which were quite a success. With a little protection given at night, they were almost as fresh at the end of a fortnight as when put out.

Anemones do wonderfully well on the Riviera, and mixed beds of them are very fine. *Anemone fulgens* is usually planted in beds by itself, and the multitude of bright, red, star-like flowers it produces, fully justifies this little indulgence.

Freeseas and *Ranunculus* blend together admirably, and seem to thrive best in a moist situation, often being seen in beds by a lake or river-side. *Hyacinths* and *Tulips* are made use of in large quantities for bedding. Their beauty is intensified, and their rich colours are relieved by white moss placed over the surface of the beds after planting the bulbs. *Cliveias*, *Spiraeas*, *Azaleas*, *Genistas*, and *Lilacs*, are also, in lesser quantities, made use of in this branch of gardening.

Occasionally one meets with beds filled with forced *Roses*. The varieties usually cultivated for this purpose are Paul Neyron, Mme. Gabrielle Luizet, Ulrich Brunner, Baroness Rothschild, La France, and Jules Margottin. I think the choicest little bed I ever remember seeing, was one composed of *Amaryllis* in flower with a groundwork of *Adiantum capillus-veneris*. *H. T.*

KEW NOTES.

VICTORIA REGIA.—A new variety of *Victoria regia* is now flowering at Kew. It differs from all the forms hitherto known in the pale green colour of its leaves, in the depth of the turned-up rim, which is from 6 to 8 inches; and in the sepals being glabrous on the outside, instead of being covered with spines, as in the others. It also differs in its time of flowering, the flowers opening early in the afternoon instead of about 6 o'clock, as do the other forms. They are, moreover, not so large as the flowers of the normal form. Kew is indebted for this plant to Mr. Tricker, of H. A. Drier's nursery, Philadelphia, who says it flowers with him when grown in a 12-inch pot, and that it grows quicker and in a lower temperature than the other forms. With him a single plant has had from fifteen to twenty good healthy leaves on it at one time, and frequently two flowers open simultaneously. It is by far the most striking *Victoria* grown at Kew within the last twenty years. In the same tank, and growing side by side with this new variety is a plant of Dixon's variety, in which the rim is comparatively low. There are no signs of flowers upon this one as yet. There is an appropriateness in the appearance of a new *Victoria* at Royal Kew in this Jubilee year, and unless Mr. Tricker objects, we might distinguish this from all other cultivated forms of *Victoria regia* by calling it the Jubilee variety.

HARDY NYMPHÆAS.

The hardy aquarium at Kew is now gay with flowers of most of the best of the hardy *Nymphæas*, including *N. Marliacea ignea*, *carnea*, *Robinsoni*, *fulva*, *lucida*, *flammea*, *albida*, *Laydekeri* *lilacea*, *alba rosea*, *odorata rubra*, *tuberosa flavescens*, and *tetragona helvola*. The last-named is a yellow-flowered variety of what is known to botanists as *N. pygmaea*. It is impossible to speak too highly of some of these *Nymphæas*, and anyone within reach of Kew who wishes to make the acquaintance of beautiful aquatic plants cannot do better than pay the aquarium at Kew a visit.

CAMPTOSEMA PINNATUM.

A plant of this is now flowering in the Palm-house at Kew, where it has been grown since 1888 when M. Glaziou of Rio sent seeds of it—and a second species, *C. grandiflorum*—to the gardens. The genus consists of ten species of shrubs or climbers, but only one, namely, *C. rubicundum*, has hitherto been introduced as a garden-plant, and that was sixty years ago, when it was figured in *Paxton's Magazine* as a *Kennedya*. *C. pinnatum* is a woody shrub, or small tree, with erect stem and branches, large pinnate leaves, with three pairs and a terminal pinnae, each 6 to 10 inches long, and about 4 inches wide. The flowers are in erect, crowded racemes, as in *Erythrina caffra*, the Kew plant having twelve

flowers in the raceme, each 2 inches long, and of a beautiful rose colour, that becomes tinged with mauve with age. It is likely to become a popular plant for tropical gardening. *W. W.*

COLONIAL NOTES.

CEYLON BOTANIC GARDENS.

MR. J. C. WILLIS, who has recently succeeded the late Dr. Trimen, as Director of the Royal Botanic Gardens, Ceylon, has published his Administration Reports for 1896. These are on the whole quite satisfactory. The Tea-crop was very successful, the export being the largest on record. Fruit-trees did not do very well. As in previous years they grew rapidly at first, but were damaged by excessive sunshine and a south-west monsoon before the fruit was perfected. A plantation of Crescent Seeding Strawberries from runners taken from plants raised from seed sent in 1892 from the Royal Horticultural Gardens, Chiswick, did marvellously well. The herbarium and library at Ceylon now need enlarging; the latter in great measure owing to the number of books received from the collection of the late Dr. Trimen. Application has been made at Kew for assistance in completing the fourth and last volume of his *Flora of Ceylon*.

NEW SOUTH WALES.

We have received from the Government printer a copy of the *Agricultural Gazette* for April. The chemist, Mr. F. B. Guthrie, has a valuable article on the fertilising value of bone-dust, and the information given should be of interest to those who make use of that manure. Dr. Cobb's contribution is a long series of letters on subjects embracing Wheat—varieties and nomenclature—Diseases (smuts and bunt, whiteheads); Maize rust; Diseases of the Plum; Apple (bitter pit, canker); Potato (wet rot, scab); Orange (Melanose [?], mal digoma, verrucosia, die-back, blackspot); Peach and Nectarine (Peach freckle, curl, the crease in Peaches); The Gall-worm; Diseases of the Grape; Onion; Timber Diseases; Preparation and Use of Bordeaux Mixture; Compound Mixtures; Drying Fruit for Home Consumption.

All the diseases, &c., are illustrated by means of excellent figures; and as the Doctor has been careful to express his ideas in the plainest possible language, the contribution is of extreme interest, and should be carefully read by all engaged in Wheat-culture, and the treatment of diseases of orchard and farm crops. A chapter on the diseases of timber is instructive, while for the information of those who desire to try the various sprays recommended, the Doctor's suggestions concerning the preparation of the mixtures should prove useful. Those engaged in fruit-drying should note the remarks concerning the use of sulphur fumes.

CONSTANTIA VINEYARDS.

According to a report on the government wine-farm presented to the Cape of Good Hope parliament, these famous vineyards are free from phylloxera. In other districts it is spreading rapidly.

CISTUS.

In these notes, which notice briefly a few kinds of *Cistus*, species and hybrids, now flowering in Edge Hall Garden, the nomenclature is that of Willkomm in his *Monograph of the Cistaceæ*; the illustrations in Sweet's *Cistaceæ* (London, 1825) are also referred to, as well as the excellent descriptions in *Clusius* (*Historia Plantarum*), made from personal observation more than three centuries ago, and nearly all of them of easy recognition.

Perhaps the commonest and best white-flowered *Cistus* of gardens is one generally misnamed *C. florentinus*. Concerning *C. florentinus* (true), Willkomm (p. 31) says that he has never seen wild specimens; that those he has seen resemble closely *C. montpelienensis*, and have flowers not nearly so large as those figured in Sweet's *Cistaceæ*, tab. 59. In fact, Willkomm seems to doubt the existence of the species. The shrub

which in gardens generally usurps the name is *C. hirsutus* var. *platysepalus*, Willkomm, p. 36, figured by Sweet, tab. 47, as *C. platysepalus*. Willkomm, who is not lavish in his praise of Sweet's figures, calls this "icon bona," and those who will take the trouble to compare their specimens of so-called *C. florentinus* with it, will find in most cases that they exactly agree. The pink-tipped buds and the nearly stalkless leaves, tapering to each end, distinguish it at once from *C. florentinus*. It is one of the hardiest of the genus, and inhabits Spain and Portugal, being wrongly referred by Sweet to Crete. Clusius figures it as Ledon, No. 4, and found it abundant in Old Castile, where it was well known by the name of Ardivieja.

of the name to the plant which now bears it dates from *Lamarck's Dictionary*. It is figured in Sweet, t. 39. It is very hardy, but is not known as a wild plant in Cyprus or anywhere else. It never bears seed in cultivation, and I believe it to be a hybrid *C. laurifolius* × *C. ladaniferus*. The name *C. cypricus* is taken from Clusius, p. 78, Ledon No. 3, *Cyprium* ×, who describes it as having pure white flowers, and having been introduced to Belgian gardens from Italy. It is evident that his description refers to some other species, and that it was transferred in error by Lamarck to the hybrid which still bears the name. The true *C. ladaniferus* from South Western Europe is far more tender, and has larger

are tolerably hardy, and are ornamental in gardens. *C. creticus* is very nearly allied to the last species, and produces seed freely, which may be easily raised. Two very good hybrids should be added to these—*C. purpureus*, not known as a wild plant, but is probably a hybrid; *C. villosus* × *C. ladaniferus*—it has large purple flowers, with a spot at the base, and is very ornamental, though it must rank amongst the less hardy kinds (Sweet, t. 17). The last to be mentioned is called in nurseries *C. lusitanicus*. I can refer to no portrait of it. It has become common in gardens during the last twenty years. It may be *C. ladaniferus* × *C. hirsutus*; the flowers are intermediate in size between the two parents suggested, and in colour they resemble those of *C. ladaniferus*. The habit is dwarf and compact, and it is one of the best cultivated varieties flowering at the beginning of July. There are many very ornamental species with yellow flowers, formerly called *Cistus*, but now classed as *Helianthemum*. *C. Wolley* Dod, Edge Hall, Malpas.

BOOK NOTICE.

FIRST REPORT OF THE WOBURN EXPERIMENTAL FRUIT FARM. By the Duke of Bedford, and Spencer N. Pickering, F.R.S.

THIS is a work of an extremely interesting character to the fruit grower, and a worthy addition to horticultural literature, containing, as it does, a fund of elaborate tabulated statistics, evidently compiled at great trouble, bearing upon the important subject with which it deals so comprehensively. We rather fear the average reader will perhaps feel somewhat confused in his efforts to master or grasp the advanced metric system of weights and measures adopted, but which is explained in the preface, and which will eventually become as common here as it is on the continent.

Every horticulturist will readily acknowledge the need of an experimental station, where experiments can be carried out on intelligent lines and on an extensive scale. It therefore follows that by undertaking and carrying out such a series of expensive experiments and their publication, the noble philanthropist-author and his assistant have the entire accord both of the fruit-growing and of the fruit-consuming community.

Throughout the entire work there appears a honest and hearty attempt to find out the "reason why," and when we get to know that, directly or indirectly, improvement is sure to follow. One sees the effect of scientific knowledge and practical experience, working, as they always should do, hand in hand.

Even those who take a severely practical view of experiments and statistics, will find much to interest them. In the case of young bush Apple trees, we fail to see the utility of the elaborate statistics of leaf and shoot measurements, seeing the different—widely different—characteristics of the several varieties, also the influence of the foster stocks used, so variable upon individual trees. Firmness in planting, and conservation of root-moisture, are important factors in the production of fruitful growth and wood growth in proper proportions, facts apparently overlooked. We should have liked to have seen more attention given to experiments bearing upon the reciprocal action of root growth and of wood growth, the latter bristling with fruiting spurs, brought about by the encouragement of an abundance of fibrous roots situated near to the surface, especially as regards the Crab stock.

We regard it as of little practical value to give us leaf-measurements, unless the character of the growth is accurately described also. Of course, we may take for granted that the Paradise stock, which seems the most favoured, will, as a rule, supply fruiting-wood amply, but what of its lasting properties? Our own experience is greatly in favour of the seedling Crab, brought under a system of root-lifting (not root-pruning), the trees being superior in longevity, in vigour and in the quality of the fruit. We also consider it waste of power to submit such kinds as Stirling Castle to annual root-pruning, as this is a kind which, in our experience, always over-bears

FIG. 8.—*CORYANTHES FIELDINGII*: BACK VIEW OF FLOWER.
(SEE P. 30.)

Similar in flower, though more cupped, but distinct in leaf from the last, the leaves being stalked and acute-cordate, is one figured by Sweet as *C. Cupanianus*, t. 70; it is hardy and common in gardens, and is referred by Willkomm, p. 50, to *C. Corbariensis*. He calls Sweet's figure "pretty good;" it is a native of southern France. Clusius, who figures it (p. 78) as Ledon No. 2, says that he observed it on the Sierra Morena, where it has not been found recently. The hardiest and tallest of the white-flowered *Cistus*es is *C. laurifolius*. Another, a most abundant species in south-west France, flowering in every roadside corner near Biarritz, is *C. salviæfolius*; this is not common in English gardens, proving less hardy than those mentioned above. A common and tall-growing kind, with large white flowers, having a purple spot at the base, is called *C. cypricus*. The application

flowers and narrower leaves, and is easily raised (I have raised it here in dozens) from seed.

The hardiest of the pink-flowered kinds is *C. crispus*; colour deep rich pink, leaves glaucous, and crimped; well-known in gardens (Sweet, t. 22), a native of Southern France and Spain; a plant easily obtained, and easily kept. The commonest pink-flowered *Cistus* of Northern Italy is *C. albidus*; flowers of a paler pink, and larger than those of *C. crispus*. It is very impatient of damp, and is easily lost.

The Gum *Cistus* of the East, extending into Palestine and Syria, and producing the precious ladanum of ancient and modern commerce, is *C. villosus* of Linnaeus, figured in Sweet, t. 35, and again, t. 44, by the name of *C. incanus*. It is called by Willkomm *C. polymorphus*, who describes (p. 19), several varieties of it. Some of these

itself—on the let-alone principle even. The application of heavy dressings of London stable manure for young fruit trees, except as surface-dressings, is very questionable, as being calculated to make flabby wood, difficult to ripen, and prone to be affected with canker sooner or later.

The question of pruning or non-pruning at planting time seems undecided, although results are given when the pruning took place at the time of planting, and when the trees were pruned hard at the end of the first year. Our own practice appears not to have been tested. It is this—the trees are planted in November, left intact until the March following, then the shoots are thinned out to four or five, and those left are shortened to one-third or one-half the previous season's growth. This lays the foundation for a healthy, well-shaped tree. Moreover, pruning at this period removes the bulk of the eggs and larvae of the winter-moth and other insects, which generally deposit their eggs on the extremities of the shoots—no mean advantage to young, struggling trees.

We are surprised at the results of autumn, winter, and spring planting, which are altogether at variance with the bulk of fruit-growers' experience. We trust these experiments will be repeated, and tested carefully. We have seen, again and again, trees taken up in October and November, laid in temporarily for a week, that have, when again removed, shown numerous freshly-formed white rootlets. Now, the inference is, that these active roots, if properly cared for by a generous mulching in time of severe frost, must give a tree advantages over one that has had its roots freshly mutilated to a greater or lesser degree in the spring. Planting when the soil is too dry or too wet should be condemned, as in the case of the former it cannot be properly made firm, and in the latter the soil would be consolidated and rendered impervious to solar warmth or aëration, which may account for the stated results of autumn planting.

With the experiment of allowing turf or weeds to have possession of the surface of newly-planted trees, we are in complete accord, as nothing have we found in our experience so detrimental to the well-being of the tree, weeds and turf being robbers, draining the soil of its surface-moisture and nutriment.

Experiments have also been made with too many varieties. We should have preferred statistics prepared from the same total of plants, but in a dozen varieties only. The same may be said of the other fruits.

In offering these criticisms, we do not forget that the whole thing is in the embryo state. At the same time, we are inclined to consider many of the experiments somewhat complex, and of little practical value; for after all we must look for definite results in the form of fruit crops more than in any other direction, and we shall certainly watch with increased interest future reports bearing upon this subject, and such as relate to the crops realised. The vigour of a tree is no criterion as to its fruit-bearing capabilities, and this is the point where trouble begins with so many. We should like to see experiments extended in the direction of converting vigorous trees into fruitful ones.

There is also the matter of insect pests, such as Apple-blossom weevil, winter-moth, Pear-midge, Plum-aphis, red-spider, mildew, and red-rust, all of the greatest importance to fruit-growers, and the methods of combating them. Information is badly wanted, because any one of the above is sufficient to cause an entire loss of crop.

The subject of mulching the roots to conserve moisture, and to encourage surface fruit-giving roots, receives but scant notice; yet we hold it to be one of the greatest importance, especially as to when and how done, all of which will receive in future editions the necessary attention and information.

MARKET AND OTHER STRAWBERRIES.

A GARDENER, evidently of some experience, writes as follows on this subject in a recent number of *Westmoreland Gazette*: "Many amateurs with but

limited experience commencing growing Strawberries for market, err in planting unsuitable varieties. I was speaking to a market-grower a few days ago (writes J. Crawford in the *Field*) about the relative merits of Strawberries for pot culture for market, when he expressed his dissatisfaction with the justly popular Royal Sovereign, owing to the soft texture of the fruit, and the fact that it showed almost the slightest pressure from the hand, and became much bruised from the ordinary shaking of the railway and carriers' vans. In this respect he compared it to La Grosse Sucrée, and placed Vicomtesse before it as a packer and traveller. It is, however, difficult to see how Royal Sovereign can be dispensed with for first early market supplies, as, all points considered, it is far superior to Noble; and size, coupled with good appearance and flavour is indispensable nowadays, even in the earliest market consignment. To meet the difficulty, extra care must be bestowed in packing, which Royal Sovereign will well repay. President still holds its own, and may well be recommended to those about to plant, as taking its hardy constitution, freedom in cropping, flavour, and firmness for packing, it is hard to beat for market. It is one of those varieties that seems at home in almost any soil that is fairly sustaining. Gunton Park is destined to take a leading position as a market Strawberry, as, besides being a free and continuous cropper, it is one of the firmest, arriving at the end of long journeys, if fairly well packed, in splendid condition. No one having any knowledge of Gunton Park will for a moment dispute its fine appearance and flavour. Sir Joseph Paxton must still be included amongst the best Strawberries for sending to a distance, but it is rather particular as to soil, falling altogether in light shallow soil. The Premier, a Herefordshire variety, is very firm, and travels well. In habit of cropping it much resembles Gunton Park, the fruit being borne on stout upright stems, out of the reach of slugs and dirt. Sir Charles Napier is still grown by many market gardeners, and a wonderfully firm fruit it is, cropping heavily when doing well, but it should be planted sparingly at first by beginners, till once it is seen if the soil is suitable. It is useful for following the above-named sorts. As regards late varieties, the new Latest-of-All bids fair to be very profitable so far as cropping size and quality are concerned, but I am not yet able to speak of its texture. My opinion is that Elton Pine will still pay for late market work, as under good culture it crops enormously, the fruit is brilliant and pleasing in colour, though slightly acid, and it is a good traveller."

Those of our readers who do not send to market, but consume the fruit of their Strawberries at home, will duly note the above, but will continue to grow the deliciously flavoured varieties which mostly do not "travel well," although some do. The best of these old varieties are Black Prince, very early; Bicton Pine (white); British Queen, the best of all Strawberries, but particular as to soil; Carolina superba, Deptford Pine, resembling British Queen in flavour; Doctor Hogg, Duke of Malakoff, flesh-red throughout, and richly flavoured, and a good bearer; Dr. Roden's Early Crimson Pine, Filbert Pine, which the late Dr. Hogg, in his *Fruit Manual*, states, is a rich-flavoured fruit, the plant succeeding in light soils—where British Queen is a failure; James Veitch, Keen's Seedling, preferred by some to any other; President, Royal Hautbois, always making sure of having both sexes; Trollope's Victoria, Dr. Roden's The Countess, and Vicomtesse Héricart du Thury, one of the best of the earlies and forcers.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By G. H. MARCOCK, Gardener, Luton Hoo Park, Luton.

Roses.—Remove all decayed blooms, and syringe the plants once a week as previously advised, affording copious supplies of water to the roots. Plants in borders in the Rose-house should be treated similarly, and if the borders are raised above the ground surface, an examination should be made with a small

hand-fork to see that the soil is moist at the roots. Remove all suckers as they appear, and mulch the borders with a few inches of fresh decayed farmyard manure.

Cyclamen.—A sowing should now be made in shallow, well-drained pans, using a light sandy compost. Sow thinly and separately over the surface, and add just sufficient soil to cover the seeds. Place the pans in a temperature of about 65° by night, and from 70° to 75° by day. Plants in cold frames intended for this season's blooms should now be afforded more space. Spray them over lightly with the syringe each morning and afternoon. Attend carefully to watering, and frequently examine the foliage for thrips. In any case, the use of X.L. All Vapouriser occasionally will be safe practice.

Clerodendron Balfouriana.—Remove the flowers from these as they become discoloured, and encourage free growth by occasional waterings with liquid-manure. When growth has ceased, the plants will require a slightly lower temperature, and more air.

Tree Carnations may now be removed to a border out of doors, and the pots plunged to the rims in coal-ashes. Do not sift these before use, unless they are very rough, in which case pass them through a three-quarter inch sieve. This will ensure a free drainage among the plants. It will be found convenient to arrange the plants in beds about 6 feet wide, with a path between each.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

The American Cranberry (Oxycoccus macrocarpus).—This plant grows freely in boggy ground, inclined to be swampy, and on the borders of lakes, where the natural soil is of a peaty nature. It is a hardy, trailing North American shrub, and the fruit is appreciated by some owners of gardens for tarts, preserves, &c., and is fit for gathering in October. The Cranberry should therefore be given a moist situation, excavating about 18 inches of the ordinary garden soil, and replacing it with peat to within 4 or 5 inches of the surface, so as to form a sort of receptacle for water. The soil about the roots should never be allowed to get dry, and especially during summer and early autumn. Pull up weeds as soon as they appear, but on no account use a hoe among the plants, even where space admits of this being done. The object should be to get newly-made beds covered with plants as quickly as possible, and the firmer the soil about the roots and intervening spaces, the sooner will the plants establish themselves over the bed, and yield satisfactory results in the way of heavy crops of fruit.

Peaches and Nectarines.—Trees of the varieties of Alexander, Waterloo, and Amsden Peaches growing against south walls, also Early Rivers Nectarine, will require to have lengths of garden-netting placed over them, and looped up in the bottom, and at intervals between them and the top of the individual trees, so as to prevent any of the fruit that may happen to drop being injured by coming in contact with the net, as would occur were the netting not looped up in the manner indicated. A soft kind of netting is preferable to the hard material of which the ordinary fish-nets are made. Keep the trees well supplied with water at the roots, and wash them overhead every afternoon with clean water applied from the hand garden-engine, where the water is not laid on as ought to be done, in all gardens of any pretensions to completeness. If the trees are not kept washed as described during the hot dry weather which we have been having for some time past, they will soon become infested with red-spider.

THE KITCHEN GARDEN.

By W. POPP, Gardener, Highclere Castle, Newbury.

Rhubarb.—The beds and lines of Rhubarb which will be forced early next year should have the crowns exposed to the sun as much as possible, by removing decaying leaves, weeds, and rubbish, but retaining all healthy leaves and stalks, not pulling any for use, and keeping the plants in growth as long as possible. If outdoor produce is required in early spring, pulling should now be discontinued generally—reserving, however, a few roots for gathering from. If the land be not very rich, which may readily occur if it have been occupied by the crop for some years, afford the later Rhubarb liquid-manure, and thus tender stalks may be gathered till quite late in the autumn.

Dwarf French Beans.—Seed sown at about this date on a sheltered border, and protected from cold,

come in very useful in the late autumn. Some early variety should be chosen for this sowing, such as Sutton's or Osborn's Forcing, Ne Plus Ultra, &c., and the seedlings thinned out to a distance of 6 to 8 inches apart, 3 feet being the space from row to row.

Saving Early Potato-sets.—When storing tubers for planting, do not select the small ones from the daily diggings, these being as yet imperfectly ripened, and not likely to give good results; but reserve a sufficient number of rows or roots, and let these get ripe before lifting them, that is, the skin should adhere to the tubers so that it cannot be easily removed by rubbing. Do not let the sets remain on the ground for days to become green, but store them thinly on shelves in a cool, airy shed for a week or two after lifting them, and also do not put them into large heaps when lifted.

Capsicums and Egg-plants.—These plants succeed in warm districts if good strong plants are planted at the foot of south or west walls; but in other parts it is best to grow them in a cold frame or earlyinery beneath the Vines, if the shade be not too dense, and syringe the plants frequently, to keep them free from insects. If grown in frames, let these be closed early in the afternoon. Liquid-manure may be afforded the plants twice or thrice a week when growing in pots, but less often when planted out.

Grubs in Root-crops.—Where root-crops suffer from wire-worm, maggot, &c., it is a good preventive of attack to use petroleum, in the proportion of a wine-glassful to 3 gallons of water, keeping the mixture intimately mixed by stirring whilst applying it with a rose-can, enough being given to saturate the soil as deep as the roots go. If very badly affected, the crop should be destroyed, and the land utilised for late Celery, or some kind of green crop, seed being sown on a different quarter, there being yet time for Carrots to form serviceable roots by the end of October, if Early Horn or Sutton's Early Gem be chosen.

The Queen Onion, if sown at this date, will form nice bulbs late in the autumn. If the land be dry at time of sowing, let the drills be thoroughly moistened with water or liquid-manure an hour or two previously, and a small quantity of salt and soot applied to the land before the drills are drawn.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Ledbury.

Melons.—Plants for fruiting late should soon be planted after this date, as, unless this be done, the fruits are not likely to be good-flavoured. Before planting, thoroughly cleanse and white-wash the Melon-house, making sure that, as far as practicable, red-spider is destroyed. Afford the hills a good soaking of water when the planting is finished, which will settle the soil about the roots, but do not wet the soil round the collar afterwards, these late Melon plants being more than usually liable to get cankered at the ground-level. Melon plants which are setting their blossoms should be kept rather dry at the root, but not so much so as to cause suffering; and when the setting of the blossom is effected, push them on rapidly by closing early after well moistening every surface, the bed, and the foliage of the plants, and allow the heat to reach 95° to 100°. Plants carrying unripe fruits should be liberally watered and top-dressed; but those plants whose fruits show signs of approaching ripeness must be kept rather drier at the root, and the air of the house should also be less moist.

Peaches and Nectarines.—The trees in the early houses from which the crops of fruit have been gathered must be maintained in a clean and healthy condition by the occasional use of the syringe, and by affording sufficient water to the border as will keep up root-action. The necessary pruning, that is, the removal of the current year's fruiting shoots and fore-right and useless wood, and cutting back gross shoots to a lateral, near their base, and laying-in the reserved young shoots, should receive attention. See that all fruits now ripening are exposed to the light, by putting on one side the overhanging leaves, and be sure that the border does not lack moisture, and that the house is sufficiently ventilated. The trees in the later Peach-houses will stand in need of much attention in the matter of keeping the shoots tied in, and superfluous laterals cut off. Now that the sun shines powerfully upon the Peach-houses at a very early hour, no syringing of the trees should be done in the morning, but at closing time only, and if plenty of water be then used, red-spider will be kept

under till the crop of fruit is taken. I go over our Peach-trees every day when the fruit is ripening, and take every one that is fit, nipping it off with a pair of blunt-pointed Grape-scissors, which is better than pulling or lifting them, for however careful one is in removing them by hand, bruising is sure to be caused thereby.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Barford, Dorking.

Grammatophyllums.—Newly-imported plants of *Grammatophyllum Ellisii* that have gained sufficient strength will be pushing their flower-spikes from the base of the young growth, and should be placed well up to the roof-glass in the hottest division, where they will require liberal waterings at the root. *G. multiflorum*, *G. Fenzliaum*, and its variety *Mesuresianum*, are already showing new breaks, and if fresh rooting material be required, it should now be afforded them; or if the plants require more space wherein to root, they may be re-basketed before new roots are made. Shallow teak-wood baskets are preferable to pots, and they should be as small as it is possible to get the plant into. Shake the plant out of the old compost, cut away all dead roots and useless back bulbs, then place it in the basket, using three parts of fibrous-peat to one of sphagnum-moss. Only just sufficient material to hold each plant in its proper place is necessary. After the operation suspend the plants from the roof of the Cattleya-house, and until the root-growth becomes active do not afford much water, the young growths being extremely liable to damp off. As the plants become re-established, remove them to the highest position in the East Indian-house, where the foliage can be placed only a few feet away from the roof-glass.

Catasetums and Cycnoches.—Where suspended from the roof in the hottest division, the *Catasetums* and *Cycnoches* appear to enjoy great warmth and a clear light there afforded. As these species are now rooting freely, and their new growths making considerable progress, they will, owing to their being exposed to plenty of sunshine, require to be examined almost every day, and abundantly supplied with water until after the flowers fade, and the new pseudo-bulbs are matured and the leaves fallen.

Such Cypripediums as *C. niveum*, *C. bellatulum*, *C. concolor*, *C. Godefroye*, and *C. G. leucochilum* having now passed out of flower, the present is a good time to repot them. Plants that are healthy, and have room for further development, should not be disturbed; merely allow them to become rather dry, and they carefully pick out as much of the fine soil as possible, replacing it with fresh compost. The roots of these *Cypripediums* are very brittle, and easily injured; therefore, when re-potting a plant, instead of turning it out of the pot, as is generally done, it is better to break the pot all around, taking away piece by piece, and if the plant is well rooted, this can be done without disturbing the roots or drainage materials. Then place the whole mass in a clean pot of sufficient size to allow space for several seasons' growth, keeping the base of the plant on a level with the rim of the pot. Fill around the roots to about half the depth of the pot with drainage, surfacing it with good fibrous loam, working in amongst it pieces of limestone or tufa rock. It is important that the compost be made very hard and firm around these plants. Before water is afforded, the plants should be allowed to become thoroughly dry at the root, and to remain so for several days. Then dip the plants in a pailful of water, lowering them so as to just cover the surface of the compost, and allowing them to remain there sufficiently long to ensure saturation. During their growing season the immediate surroundings of the plants should be kept moist by damping well between the pots several times each day, but great care should be taken to avoid water getting into the growths. The species named luxuriate in the moist stove or East Indian-house in a position where fresh air can circulate freely around them; and they must be shaded at all times when the sun is bright. Sponge the foliage occasionally, but in so doing great care must be taken not to raise the leaves higher than is really necessary, as they are easily cracked.

Habenarias, &c.—For the purpose of giving contrast in colour, both as regards flower and foliage, *Habenaria militaris* is well worthy of extended cultivation. Other species, equally beautiful and attractive, are *H. carnea*, its pure white variety *nivosa*, and *H. Susanæ*. All of these plants are growing freely, and should be placed well up to the roof-

glass in the East Indian-house, in subdued light. Preserve a moist atmosphere around them, and keep them quite free from insect-pests, which, if not detected in their early stages, quickly disfigure the soft, tender leaves. The plants will now require plenty of water at the root until growth is finished, and the flower-buds commence to open; when the quantity should be gradually reduced.

THE FLOWER GARDEN.

By CHARLES HERRIS, Gardener, Dropmore, Maidenhead.

The Borders of Herbaceous Perennials.—The plants should now be at their best, and will, in order to preserve tidiness and cleanliness, require frequent attention. After the late rains, weeds grew rapidly, and now that a season of heat and dryness has set in, the beds and borders should be carefully hoed over, first hand-weeding the ground if that be necessary. The best kind of implement to use is a Dutch hoe of moderate width. The hoeing, whilst killing the weeds, will render the surface crumbly, and thus prevent loss of moisture by evaporation, and admit air to the roots. It will be found that *Achillea*, *Galega*, *Alstroemeria*, and a variety of other subjects, must be afforded slight support to maintain the flower-stems erect, and for this purpose short neat stakes of Ash or Hazel should be used, and the stems merely looped up to them with raffia or soft, thin string. With a view to prolonging the flowering period of *Delphiniums*, *Galegas*, *Liliums*, *Coreopsis grandiflora*, and others which soon feel the effects of drought, unless heavily mulched on light soils, water should be freely applied to them once a week in dry weather. Besides these, the following herbaceous plants are also now in flower: *Anchusa italica*, *Rudbeckia californica*, *Campanulas* in variety, *Helenium pumilum* and *grandiflorum*, *Centaurea macrocephala* and *C. ruthenica*, *Lysimachia thyrisiflora*, *Ranunculus aconitifolius* (Fair Maid of France), *Monarda didyma*, *Bocconia cordata*, some of the *Phloxes*, the showy and floriferous *Helianthus multiflorus*, *Aconitum bicolor*, *Oenothera Youngi*, *Erigeron speciosum* superbum, Iceland Poppies, *Bupthalmum cordifolium*, *Linaria dalmatica*, the handsome *Pentstemon*, *Cobaea barbatus* and *Richardsoni*, *Aquilegia*, *Cephalaria tartarica*, *Iris Kämpferi* in variety, *Spiraea venusta* and *S. palmata*, the soft yellow-flowered *Lupinus arboreus*; *Lathyrus grandiflorus*, *L. latifolius*, *Verbascum Chaixi*, *Funkia Sieboldi*, *Lychnis chalcidonica*, and *Chrysanthemum maximum*.

Heuchera sanguinea.—This extremely useful and elegant dwarf herbaceous plant should be lifted after flowering, pulled into small pieces, and be replanted if a larger stock of the plant is desired. If clumps of it are allowed to stand, the flowers become fewer, and the plant altogether unsatisfactory. It is a subject that is not fastidious as to soil, although it flowers with the greatest profusion in one that is moderately heavy and moist. The plant having now passed out of flower may be divided during the first spell of showery weather. In dividing the plant, reject pieces with woody stems such as those found in the middle of old clumps. The divisions should be planted not less than 1 foot apart each way if bedded, or they may be dotted about in the front line of the herbaceous border.

Iris germanica.—At the present season the clumps of these plants may be lifted and divided, or the clumps reduced in size. Plants which are taken up and divided become well established before the winter, and the flowering next year is not impaired in the least degree. A slightly shaded border is well adapted for the growth of German *Iris*, which, while they are in flower, are very handsome and effective, and at other seasons the foliage is not unpleasant. Surplus plants may be set out on the margins of lakes and streams, or on bold rockwork.

VARIORUM.

USEFUL PLANTS OF INDIA.—"But while the English have probably introduced a far larger number of flowering garden plants into India than the Buddhists, Arabs, and Portuguese, all put together, and the transcendent glory of the introduction of the febrifuge *Cinchona* trees will for ever be theirs (i.e., Sir Clement Markham's), the Potato and the Apple would seem to be their only contribution to the naturalised food-staples of the country." *Sir George Birdwood.*

ADVERTISEMENTS should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

GARDENER
TION.—We are

dent, Mr. J. MILBURN, hon. sec. of the Bath auxiliary of this institution, that at the recent horticultural show at Bath the sum of £15 was realised by the sale of Roses and other flowers. The auxiliary was founded in 1893, since which date the sum of £384 6s. has been transmitted to the central fund from Bath and Bristol. Thanks are tendered to exhibitors and others who have kindly given flowers, &c., for this purpose.

BOTANICAL MAGAZINE.—The following plants are figured in the last issue of the *Botanical Magazine* :—

Zamia obliqua.—A fruiting specimen of this New

Helianthus tuberosus, Linn., sp.—Under this heading the editor sums up the history of the "Jerusalem Artichoke," which he refers definitely to the above-named species, and thus settles an old controversy; t. 7545.

Lisochilus milangianus, Rendle. — This is the *Eulophia bella* described in our columns in 1889 by Mr. N. E. Brown; t. 7546.

HORTICULTURAL EXHIBITION AT HAMBURG.—The uninterrupted series of horticultural congresses at Hamburg has been very successful. So far, the spring and two summer flower shows have been held; a third exhibition will open on July 28; another

considerable number of exhibitors, and the congress was participated in by some of the principal botanical institutions and societies of Hamburg, Frankfort, Innsbruck, Berlin, Washington, &c. It thus became representative of the interest so widely felt for the undertaking. Another new idea is the historical section, including representations of parks and gardens from the beginning of the sixteenth century, and enabling visitors to study the characteristics during that period of landscape gardening in France, England, Sweden, and other countries, including, of course, Hamburg. All the pictures came from the Museum für Kunst und Gewerbe. On August 27, the autumn exhibition will open. The

small show has been arranged, and almost daily the journals speak of new fixtures. Already six minor exhibitions have been held of parlour plants grown by residents of Hamburg. Congresses followed them and were quite successful. I lately visited the scientific exhibits, which were well and attractively arranged. This section includes twenty-two classes devoted to creatures beneficial and injurious to crops, plant diseases, the biology and morphology of plants, the Sugar-cane, artificial manures, economic exotic plants, methods of instruction, especially that of gardening pupils, and ways of combatting the enemies of plants. There were a

programme mentions 439 classes, and, judging from the spring shows, will be well carried out, the committee having even to consider the necessity for erecting some new buildings, the present ones being insufficient. *Ch. de Bossière*.

—An exhibition in connection with the General Horticultural Exhibition now running at Hamburg is to take place from July 30 to August 3. We note in the programme among objects for which prizes will be awarded, tuberous Begonias, and other species of Begonias in flower. Borders or margins, and edgings of these plants will be permitted when these consist of one species or

variety. Carnations in pots with reference to beauty and successful cultivation. There is a section for Pelargonium zonale, and with variegated leaves; and another for cut blooms of Gladiolus, florists' Carnations, herbaceous perennials; a section for pot fruit-trees with fruit on them. These include Peaches, Apricots, Apples, Pears, Vines grown without artificial heat, also for the best assortment of Vines in which there is no restriction imposed as to heat. There is a number of classes for collections of hardy fruits in season, and for Peaches, Nectarines, and Apricots. We note about a score of special prizes of honour, ranging from 20 marks to 500 marks, which are offered for a variety of objects shown on this occasion.

AN AUSTRALIAN NURSERY.—We have received from Messrs. L. SUMMERLIN & Co. a series of photographs representing plant-growing and other departments in their nurseries near Brisbane, Queensland. One of these illustrates a Rose nursery of seventeen acres at Mount Gravatt, in which a fine bed of Tuberoses is seen, which commenced to flower in the open air in November last; (2) a large bed of Eucharis plants, in a house in the nursery at Woolloongabba; (3) a general view of the same nursery; (4) a house, about 66 feet long and 18 feet wide, containing miscellaneous plants; (5) two beds of Roses in the nursery at Mount Gravatt, said to have been budded in November last; (6) masses of Violets, Ericas, and Camellias, in the same nursery; (7) a house, containing hard-wooded plants, at Woolloongabba; (8) bed of Tuberoses, intended for winter flowering, planted in March last, in a situation where shelter can be afforded when this becomes necessary; (9) a view of the business premises in Queen Street, Brisbane. The photographs were taken in April, and we are informed that Mr. L. SUMMERLIN, who is desirous of retiring from business, is about to dispose of the establishments.

MR. THOMAS CHRISTY informs us that he has removed his collection of plants from Sydenham to Wallington, Surrey, to which place he is desirous that his correspondents should address post-packages of plants and books, and thus avoid the expense and delay of re-addressing them.

HORTICULTURE FOR CHILDREN AND ARTIZANS.—Our correspondent, M. C. DE BOSSCHERE, has published a brochure, entitled "*Culture des Fleurs par les Enfants et par les Ouvriers*." In this he comments on the attention paid in England to allotments and other small spaces cultivated by working-men, and to the encouragement given to children's gardening. M. DE BOSSCHERE suggests that, as profit and moral and physical benefit are the rewards of this rural occupation, horticulture on a small scale should receive that attention universally which is now only given to it in a few scattered localities on the Continent.

"OUR STAR-LIT ERA."—Mr. W. B. HARTLAND of Cork has issued, under this title, a nicely got-up handbook devoted to "Conference Daffodils," and including verse and prose lines appropriate to this—a special Jubilee issue. We wish more particularly to call attention to the drawings of Daffodils, which form the most attractive feature of this Album. They are not merely pleasing as pictures, but accurate, and their number—about sixty—is representative of the many varieties of Narcissus now under cultivation.

STOCK-TAKING: JUNE.—It will not be out of place here to briefly record the fact that the revenue returns for the past three months (the first quarter in the financial year) show an increase over the same quarter in last year of nearly a million sterling. Good news this for the Chancellor of the Exchequer. The increase is spread over every item excepting that headed "miscellaneous." As for the trade returns for June, there have been two hindrances to a "record" result—the occurrence of the Whitsuntide holidays, and the magnificent and universal Jubilee celebration. Still, with all these—in some sense—drawbacks, the imports for the past month amount to £36,321,809, against £35,229,255 in June, 1896; showing a gain of £1,092,554—a very fair show

indeed. In the section "animals" there is a very large increase; so also is there in the matter of food generally, Canada sending an enormous supply of cheese, and America great store of hams. There was also a fine show of butter; wine also looked up. We cannot expect much of a show from Coffee in the face of the various popular competitors for a place on the breakfast-table; and though tea does not foot up so largely in the past month, still it continues first favourite. There was an up and a down movement in the various materials for textiles, but none of startling importance. One noticeable increase is that of sawn timber: the streets in all our principal cities having afforded evidence of this. The following are the are giving usual extracts from the "summary" table:—

IMPORTS.	1896.	1897.	Difference.
Total value ...	£ 35,229,255	£ 36,321,809	+1,092,554
(A.) Articles of food and drink—duty free ...	12,504,956	12,879,583	+374,627
(B.) Articles of food and drink—dutiable ...	1,806,000	1,754,745	+148,736
Raw materials for textile manufactures ...	4,646,048	4,498,012	-148,036
Raw materials for sundry industries and manufactures ...	4,499,017	5,025,197	+526,180
(A.) Miscellaneous articles ...	1,246,702	1,044,379	-202,323
(B.) Parcel Post ...	92,424	49,998	-42,426

It is not unworthy of record here that whilst the demand for Japanese teas is steadily on the decline, that for Ceylon and Indian is rapidly increasing in other countries—notably, we are told, in the United States. Nor should we omit to note the falling off in the importation of cereals during the past month; this, however, will probably be corrected ere the present month closes. A most welcome addition to the fruit supply in June was an additional £150,000 worth of Oranges; and this brings us to the imports of fruits, roots, and vegetables for June as follows:—

IMPORTS.	1896.	1897.	Difference.
Fruits, raw:—			
Apples ... bush.	37,917	66,669	+28,752
Cherries	116,356	158,056	+41,700
Plums	7,466	14,773	+7,307
Pears	8	52	+44
Grapes	3,987	4,469	+482
Unenumerated ...	159,512	159,886	+374
Onions	366,339	221,824	-144,515
Potatoes ... cwt.	1,151,731	1,138,938	-12,793
Vegetables, raw, unenumerated ... value	£192,259	£208,171	+£15,912

It seems a pity that we can procure only so unsatisfactory a record of imported fruit as that under the heading "unenumerated," knowing the efforts put forth by our Continental friends to get early on the London market. All in good time, possibly. The record of imports for the past six months shows a total of £225,435,246, against £216,503,033—a gain of £8,932,211. Coming now to the

EXPORTS.

we find that the various jubileations have been operating here to some extent; thus we find a falling off amounting to £1,470,064, the figures for the past month being £19,089,997, as against £20,560,061. The greatest falling off is in textiles (£942,000). Affairs in the East, from Calcutta to Constantinople, have surely told on all the markets, and the tinkering with the United States tariff has not given encouragement to speculation on either side of the Atlantic. With but three exceptions, depreciations have to be recorded in the various sections into which the exports are divided. The six months show a total export of £117,410,452, against £119,145,740—a falling off, as compared with June in last year, amounting to £1,735,288. As a matter of course, this state of things will soon be altered, if we can steer clear of lock-out and strike!

"SYNOPTICAL FLORA OF NORTH AMERICA."

—A further instalment of this great work, commenced by the late ASA GRAY, has just been issued (London: WESLEY & SON, 28, Essex Street). It is a large octavo of about 300 pages, and completes the first part of the first volume. It comprises the Orders from Caryophyllaceæ to Polygalaceæ. The Gamopetalous Orders were published by Dr. GRAY himself in 1878 and 1884 respectively. The Thalamifloræ are now complete, Dr. GRAY's work having been continued by the late Dr. SERENO WATSON, Dr. B. L. ROBINSON, and others. The typography and arrangement are very convenient, and the index full. When it is remembered that the area dealt with includes the whole of North America outside Mexico, the delay in publication is fully accounted for.

INSECTS OF A LONDON BACK-GARDEN.

—Papers upon this subject, written by Mr. F. ENOCK, have lately appeared in our contemporary, *Knowledge*. It may well astonish those whose eyes have not been already opened to the stores of scientific treasures often concealed in unlikely places, to hear how many interesting and unexpected marvels Mr. ENOCK has brought to light. It is a bad workman who quarrels with his tools, and the too-zealous entomologist, longing for a country life, would do well to search his own city garden. By night and by day he will find insect treasures "under any old musty board, an odd brick-end, or a heap of leaves." The articles here referred to are pleasantly written and illustrated, and their study should lead the really earnest beginner on to the consideration of larger works on the subject, and, above all, should tempt him to seek and find for himself.

CHISWICK.—A large gathering of members of the various committees visited the garden on Wednesday, on the invitation of the council. Considering the heat, drought, and wind, the garden was found to be in excellent order, and reflecting great credit on Mr. WRIGHT and his staff. The luncheon, presided over by Sir TREVOR LAWRENCE, was a most successful "function." In the afternoon an address was delivered by Dr. MAXWELL MASTERS, with a view of eliciting a discussion on the methods to be adopted for the future development of the garden. A discussion followed, in which Sir JOSEPH HOOKER, Dr. RUSSELL, Dr. FLOWRIGHT, and the PRESIDENT, took part, but unfortunately no speaker treated the matter from the standpoint of the practical gardener. We may allude more fully to the subject in a subsequent issue. Letters were read from M. DE VILMORIN and Mr. MALCOLM DUNN, speaking in high terms of the value and impartiality of the trials conducted in the garden.

VICTORIA MEDALS.—A number of letters have reached us on this subject, a few written in a strain of indignation, but mostly treating the humorous side of the question. Considering the delicate nature of the circumstances, and the excellence of the intention, it seems to us that a discreet silence will be most acceptable to all parties concerned.

EXAMINATION IN HORTICULTURE.—The following is the Report presented to the Council of the Royal Horticultural Society by the examiners:—We beg leave to report that we have examined the papers submitted to us—in all 184. Of these we selected eighty-nine as worthy to be placed in the 1st class, fifty-five in the 2nd, and twenty-eight in the 3rd. The remainder, twelve, are not placed; the number of marks attained being below a hundred. The distribution of the examinees were 169 in England, six in Scotland, one in Ireland, one in Wales, and seven gave no address. The present examination shows a very considerable improvement upon the results of that held in 1896. This will be apparent from the following comparison of percentages:—Those not classed are only twelve in number, or nearly one-third of that last year (thirty-four). The percentage of the third class (100 to 149 marks) has fallen from 32.2 (1896) to 15.2 (1897). The percentage of the second class (150 to 199 marks) is nearly stationary, viz., 34.8 (1896); 29.8 (1897). The percentage of the first-class (200 to 300 marks)

has made the astonishing increase from 10.5 (1896) to 18.3 (1897). These results are most encouraging. Speaking generally, the answers are extremely well done. The information is accurate upon the whole, and the subject-matter well expressed. Perhaps the "Practical Horticulture" showed, as might be anticipated, a slight superiority over the "Elementary Principles." GEORGE HENSLow, JAS. DOUGLAS.

PUBLICATIONS RECEIVED.—*The Forester* (Princeton, New Jersey), June 1.—*Agricultural Bulletin of*

easily-grown nut been everywhere available?" The cultivation of it is to be widely encouraged. Reports of a successful flower-show and other notes are included in the issue.—*Bulletins* 142-4 from Michigan State Agricultural College, include a report of Small Fruit Trials at the college, Fruit Tests at South Haven, and Vegetables old and new.—*Agricultural Gazette of New South Wales*, April.—*Bulletin* 114, New York Agricultural Experiment Station. This is an issue devoted to the cultivation of Gooseberries, and the remarks of the writer (Mr. S. A. BEACH)

naire d'Horticulture et de Jardinage. This work has now progressed as far as the publication of the article on Samydacées.—*Reports of the Agricultural Assistants at Cape Town, Graham's Town, and Stellenbosch*; also, *Report of the Government Wine-farm, Groot Constantia* (Cape of Hope, Department of Agriculture). Both these publications refer to the unfortunate appearance and increase of Phylloxera in the Stellenbosch division, and to the great fears entertained of the rapid spreading of the pest, which has already positively destroyed whole vineyards, and "threatens more and more the existence of an agricultural industry which cannot be well substituted by any other." American Vines are being largely introduced, but the demand is likely to be far greater than the supply.

HOME CORRESPONDENCE.

PEACHES AND NECTARINES IN THE OPEN AIR.

There appears to be a very good crop of Peaches and Nectarines in the south, but in several gardens I have noticed the foliage terribly affected with blister (*Exoascus deformans*), so much so that when the affected leaves and shoots have been removed the trees have been almost nude of foliage. I once thought that ill-ripened wood was most liable to this disease, but this season ripe and unripe shoots are equally bad. Is there anything which might be applied early to the leaves that would prevent the malady spreading? [Try weak Bordeaux Mixture in spray as a preventative.] The only remedy I have ever practised was to remove the affected parts and burn them as soon as possible, after which I have syringed the trees with water containing soft-soap and sulphur. Cold nights are undoubtedly favourable to the disease. In the case of trained trees, select some young shoots to take the place of those to be cut away after fruiting, and when the selected ones are about 4 inches long, tie them about 2 inches above the base to the shoots they spring from, so that they may be afterwards laid in straight and without breaking. Trees require to be attended to in this particular several times during the season. At the same time, a certain amount of pruning should be done, so that at the end of the season only sufficient shoots to retain then remain. If the crop requires to be thinned, it should be commenced early, by removing only those that are ill-placed; or where they are uncommonly abundant, the final thinning should just precede the stone process. Some gardeners boast of the remarkable number of Peaches their trees bear, but a fairly good crop of fine, large, highly-flavoured fruits, is the most satisfactory in the end. Black and green-fly and red-spider are the most troublesome pests; but with a few good syringings of quassia-water, very little after-trouble will be experienced. H. Markham.

SWEET PEA "CUPID."—A few days ago, when visiting Mrs. Price's garden at Pen-Moel, near Chepstow, I was surprised to have some excellent clumps of this variety pointed out to me by Mr. Simpson, the gardener. He had planted the clumps in various positions, and each of them was a mass of blossom. Some of the clumps were also podding freely. Four seeds were sown in a 5-inch pot in early spring and placed in a frame, and after being thoroughly hardened-off were planted-out, but great care was necessary to prevent slugs from devouring the dwarf neat clumps. The garden at Pen-Moel is practically a limestone quarry, and before trees and shrubs could be planted, the rock had to be blasted, and fresh soil carted in. The soil is highly impregnated with lime, and to that fact I have no doubt Mr. Simpson may attribute his success with this beautiful novelty. R. Turnbull, Beachley, Chepstow.

APRICOTS, DAMSONS, AND CHERRIES A FAILURE.—The branches of Apricot-trees here die off annually to a great extent, and although they usually give a fair amount of blossom, and are protected with fishing-nets, &c., in the usual way, the trees only set a few fruits, and the greater part of them generally rot as soon as they commence the second swelling. The variety throughout is Moor Park. They are trained on a good south wall, and the roots are in a limestone soil. The trees have been planted about sixteen years. Some have died, and have been replaced with young trees in the best loam at command, with the addition of brick-rubbish; but notwithstanding attention to mulchings, have gone off in a similar manner. I have had experience in growing Apricots in various parts of the

FIG. 10.—DISSECTED FLOWER OF CORYANTHES FIELDINGII. (SEE P. 30.)

Explanation of figure: s, 1, 2, 3, sepals; p, 1, 2, petals; col, column; gl, glands; a, anthers; l, lip.

the Malay Peninsula, for April. This is devoted to reports and notes upon Spices: Nutmegs, Cloves, Cinnamon, Cassia, Sirih, Cucebs, Pepper, Kadok, and others.—*Agricultural Journal, Cape of Good Hope*, includes reports of agricultural experiments and experiences both with crops and stock.—*Proceedings and Journal of the Agricultural and Horticultural Society of India*, January to March. Contains an account of *Cyperus bulbosus* and of the preparation of "coffee" and "chocolate" from the nuts of this plant. It is queried "would millions have died in India during the last famine had this prolific and

should prove valuable to all growers. The carefully-prepared plates show the peculiarities in the shape and size of the berries of the different varieties treated of, the effects of pruning, &c.—*Erythea*. This West American and general journal of Botany, edited by W. L. JERSON, publishes, in the May issue, an illustrated article on *Boschniakia strobilacea*.—*Wiener Illustrirte Garten-Zeitung*, June.—*The Tropical Agriculturist* (Colombo), June, contains, as usual, much appropriate matter.—*Favourite Flowers of Garden and Greenhouse*. The forty-fifth part of the fourth volume of this publication is now ready.—*Dictio-*

country, and in many kinds of soil, and have seen gumming and dying-off of branches, but never to such an extent as here. Again, there are three large Damson-trees (I am unable to give the variety), in bush form, that are equally disappointing. They were planted, I believe, at about the same time as the above trees, and have never given satisfaction. They flower fairly well each year, but these fail to set, and many of the young shoots made this year are dying off now. Young trees of the Farleigh variety, when not hindered by frost, produce good crops in the same kind of soil. Morello and sweet Cherries growing on a north wall give a grand display of flower, but each year only a poor crop of fruit is the result. The shoots on these die in a similar manner. The Cherries are trained on a galvanised wire trellis, but the Apricots with nails and shreds. On first noticing this, some four years ago, I was of opinion that the wire was responsible for the mischief in the case of the Cherries, but found it was not so, as the greater part of the dying shoots did not touch the wire. Apples and Pears, taken as a whole, do very well indeed in this soil, and heavy crops of Plums have been obtained from trees trained on walls. As it is desired to improve matters respecting the three first-named fruits, if some of the numerous correspondents to the *Gardeners' Chronicle* having had experience in limestone soil, will kindly give a hint or two as to what additions can be made to the soil, or if other varieties of Apricots would be more likely to succeed, it would hasten matters to better results, as much time is often lost in trying experiments. *R. D. Long, Lincoln, July 13.*

BUD OR SEED VARIATION IN PYRUS JAPONICA.—I was interested in Mr. Parkin's note on this subject on p. 348, last vol. of the *Gard. Chron.* Though I grew the plant for many years, I noticed no transition of scarlet to pink, nor any other change of colour or of type such as he describes. But as this sport has developed and repeated itself, it is probably sufficiently fixed for propagation purposes. I have found *Pyrus japonica* very variable from seeds. Sow any colour, white, scarlet, pink, you will probably have plants of all colours from each, with not a few, more or less, novel, intermediate hues. Seedlings also vary widely in vigour, and habit as well as colour. The white fringe to the pink flowers should prove a welcome addition. *D. T. F.*

SPIRÆA ARGUTA ZABEL (S. MULTIFLORA × THUNBERGI).—I fully agree with Mr. W. J. Bean, that *Spiræa arguta* is the most beautiful of all early-flowering *Spiræas*. I have also recommended this *Spiræa* at various times as one of our best and most useful early-flowering shrubs both for forcing and for garden decoration. I wish, however, to correct a mistake made by Mr. W. J. Bean in saying that *Spiræa arguta* is a cross between *S. multiflora* and *S. media*. *S. arguta* is a cross between *S. Thunbergi*, Sieb., and *S. multiflora*, Zabel (being itself a cross between *S. crenata* and *hypericifolia*), and Mr. W. J. Bean was right in saying that *S. Thunbergi* seems to share in its origin. *Spiræa arguta* was raised by Mr. H. Zabel from seed of *S. multiflora*, perhaps occasionally fertilised with pollen of *S. Thunbergi*, and fully described by him as a hybrid between *S. multiflora* and *S. Thunbergi* in his book, *Die strauchigen Spiræen der Deutschen Gärten*, p. 44. This book dealing with all the cultivated species, crosses, and varieties of *Spiræas*, is a very useful and indispensable one for all who wish to study this difficult genus, so much enlarged with numerous varieties and hybrids of garden origin. Mr. Zabel has carefully studied this genus during twenty years, and cultivated all the species, crosses, and varieties he could get from everywhere in the botanical garden of the Academy of Forestry at Münden (Hanover); he has also raised a large number of crosses and varieties. The garden of Münden contained, at the time when Mr. Zabel had charge of it, one of the best and largest collections of trees and shrubs existing in Germany, and I often paid a visit at that time to Mr. Zabel and his garden, where I always found a wealth of interesting things for a lover and student of trees and shrubs. *A. Rehder, Erfurt.*

WASPS AND ROSES.—The cause of the condition of the enclosed Rose leaves has puzzled me for some days. I thought that the oval and disc-shaped pieces taken out of the leaves had been consumed by some of the looper caterpillars; but I had the pleasant and interesting experience of sitting on the lawn this afternoon and witnessing the exact *modus operandi* of the marauders, who are wasps. I watched the performance by seven different individuals, and this is

how they uniformly went about it: the operator lights on the edge of the leaflet he selects for the purpose, with his head pointing to the base of the petiole, he then commences cutting with his mandibles with a scissor-like action, in a circular direction, first towards and then away from the mid-rib of the leaflet, remaining on the piece he is cutting out. This piece he deftly tucks under itself, doubling it as he proceeds, and holds it in this form to the end of the operation, and in this form he ultimately flies away with it. Of course, in making the sweeping cut he ends with his tail pointing to the attachment of the petiole to the stem of the plant. What do the wasps use this material for? A singular feature of the matter is that they confine their attention to one particular kind of Rose (the old *Baronne Prévost*, I believe it to be): *Gloire de Dijon* and others they will not look at. *G. Paul, St. Mary's Avenue, Harrogate.*

A JULY FROST.—A frost in July in the Midlands is as rare as snow in harvest; but such was the case at Beckford, Gloucestershire, on the 8th inst. The terrestrial radiation thermometer belonging to Mr. Slade, F.R.Met.Soc., fell to 31°, the thermometer in the screen falling to 36°. Mr. Slade says there has not been such a low reading in July at Beckford in the fourteen years over which his observations extend. The altitude of the station is 120 feet. At Bredons Norton, three miles distant from Beckford (altitude 200 feet), our Kew-tested thermometer in the screen, 4 feet from the ground, fell to 42°, or 6° higher than the screen-temperature at Beckford. We have no exposed thermometer on the grass. There are generally more and severer frosts at Beckford than at Bredon's Norton, although when there is no frost the minimum and the mean of both places are nearly alike. Both these stations are at the base of the Bredon Hill, which has an altitude of 979 feet. *W. Burgess.*

LISIANTHUS RUSSELLIANUS.—This very handsome species, which is now known according to Nicholson's *Dictionary of Gardening* as *Eustoma Russellianus*, is a Victorian Era plant, as it bloomed for the first time at Bothwell Castle in the summer of 1837, and seed was first offered for sale by Mr. James Outhill in 1841—42. It appears to be in danger of being lost to cultivation, for it is now rarely met with. But then it is one of the plants difficult to cultivate successfully; and in these days, when there are many fine subjects which can be grown with comparative ease, plants requiring special management do not appear to find favour except with enthusiasts. Happily, it is one of the subjects which crops up occasionally, and is presented to view well grown, and by this means is preserved from being quite lost. Happily, also, there are botanical gardens in which such plants find refuge, and in this way they get handed down to succeeding generations. *R. D.*

LATHYRUS SPLENDENS.—I was much pleased to read that the blooming of *Lathyrus splendens* at Kew had attracted considerable attention; and your engraving is perfect (fig. 106, p. 315 of our last volume). only, allow me to take exception to your statement as to the colour being scarlet. It is a very peculiar colour, hard to define, I believe, but certainly to be classified rather as a shade of crimson than of scarlet. Under cultivation here, the bunches have at times up to twelve flowers. Foliage is very variable, in many cases reduced to a true filiform appearance. This plant is not common at all in California, growing only in San Diego Co. at the extreme south of our State, and is found also in lower California. Although a native of the desert high region of the interior, it adapts itself freely to liberal watering, provided it has sufficient drainage, and in this case it will keep growing and blooming all summer, and not die down as it does in its native habitat, where it is essentially a winter bloomer. Frost is not unfrequent there, and I believe the plant will prove hardy in many parts of England, at least, where they have made a success with *Fremontia* and *Romneya*. Under cultivation, at least, seed is very sparingly produced, and nobody in this country has ever succeeded in propagating it from cuttings. *Dr. F. Franceschi.*

FRUITS OF THE VICTORIAN ERA.—There is much force and truth in what your correspondent "H. H. R." says on Pears. But then the difficulty often lies between making a catalogue or doing seeming injustice to old favourites through what may appear disparaging omissions. The case is worse, however, when such fine varieties as *Marie Louise*, *Jargonelle*, *Williams' Bon Chrétien*, *Glout Moreau*, *Duchesse d'Angoulême*, are underrated. As a suc-

cessful caterer for large families, I should have been nowhere without these Pears. But Figs fare worse than Pears, if a summary of sorts grown, and which had not only maintained but added to their popularity, were intended. But if Figs introduced during the Victorian Era were meant, then it might be quite right to exclude the *Brown Turkey*, that is, *Lee's Perpetual*, and *Dr. Hogg* adds fifteen other aliases. This is probably the oldest, as it is by far the best Fig we have in cultivation, either for out of doors or under glass. There are other good Figs, but they are, as it were, the fringing of the dessert. For good measure, pressed down, running over, bursting wide open with luscious pulp, and never failing of supplies in possession and prospect, give me the *Brown Turkey* first, last, and all through the season. *D. T. F.*

FIRING STRAWBERRY PLANTS.—The answers to correspondents in the *Gardeners' Chronicle* are mostly so sound and practical, that the following instructions on p. 12 will probably startle not a few growers. For plants overrun with the fungus pest, *Botrytis vulgaris*, sprinkle straw over the bed and set it on fire. At a month or six weeks after this is done, a crop of new leaves will appear, and then spray with a dilute solution of Bordeaux Mixture, or with a solution of potassium sulphide, 1 oz. to 3 gallons of water. Most of us might be prepared to try the spraying, but the firing of Strawberries is quite a different matter. How the great Doctor (Lindley), lashed the practicals on his day for mowing or slashing off the leaves, runners, fungoid, or other pests of Strawberries, condemning all such short cuts to cleanliness and renewed health as ignorant barbarity. One can readily imagine with what gusto, force, and irony the old Doctor would have exhausted his unique collection of strong adjectives against firing. But, perhaps, after all it is of more practical importance to hear and see Strawberry plants under fire. The idea is so novel, the practice on the face of it so dangerous, that to all disposed to adopt "G. M.'s" advice, I should say do not until furnished with further particulars, stronger evidence. It would take a thickish layer of straw to burn off the leaves and leaf-stalks of Strawberry plants with sufficient energy and fierceness to destroy the vitality of this fungus pest. And unless the latter is done, where is the benefit of firing over mowing the tops to the ground, raking or forking them off and making a bonfire of them, heavily laden with vital spore, of such heat and intensity as must make an end of the growing-power of the latter? It will probably be a startling revelation to all growers that Strawberry crowns will pass through surface fires sufficient to consume their leaves and leafstalks, and live. Of course, much may depend on the degree of heat to which they are exposed, and the duration of it. But even Strawberry-leaves overrun to the uttermost with the *Botrytis vulgaris* are by no means inflammable material, and present a very striking contrast to common bracken or mature stems or leaves of Pampas-grass. These burn with tremendous fierceness, and though the heat is intense, especially of the latter, the plants pass through the fiery ordeal safely, because it is so short; it is a mere flash in the root, and root-stocks uninjured. But perhaps "G. M." merely means to pass a mere flash of dry straw over the Strawberry beds to frighten the fungus pest. It is certain from his receipts for repeated sprayings of the new growths afterwards that he hardly expects to roast the fungoid spores to death through his surface firing of his Strawberry beds. In that case, the firing does not seem worth the very serious risk of roasted crowns and runners, nor the candle, that is, the straw. *D. T. F.* (See article on p. 36.)

NURSERY NOTES.

MESSRS. CUNNINGHAM AND TRAYER,
EDINBURGH.

ON the occasion of a visit paid to this nursery on May 29 last, the following species and varieties of plants were remarked by the writer in bloom:—*Anemone palmata alba*, *Genista hispanica*, *Primula rosea*, *Sedum acre aureum*, *Hutchinsia petraea*, like a tiny Iberis; *Euphorbia epithymoides*, a compact, dense shrub, very strong, with a profuse display of golden bracts; *Thalictrum aquilegifolium rubrum*, *Corydalis nobilis*, *Scilla esculenta*, *S. e. minor*, *Ranunculus speciosus flore-pleno*; *R. aconitifolius flore-pleno*. A fine lot of both, popularly known in many rural districts as the white and yellow

Bachelor's Buttons, *Anemone sylvestris*, pure white; *Cytisus Ardoini*, an extremely pretty dwarf species, much resembling a *Genista*; *C. præcox*, a very graceful light lemon-colour flower, well adapted for the open, and much grown in pots, window-boxes, and in conservatories; Golden-leaved Marjoram, the most thoroughly golden of all herbs in the spring, but, like Mint and Thyme, losing something of its brightness as the season advances; capital stock of *Trollius europæus*, flore-pleno; *Doronicum plantaginum* var. *Harpur Crewe*, *D. p.* var. *Clusii*, and *D. p.* var. *excoelum*.

Among the fine collection of *Iberis* noted here, the best were *I. coriifolia*, *I. sempervirens*, *I. superbum*, *I. capitata*, and the improved variety of *I. sempervirens* Garroxiensis, a variety with smaller flowers, the racemes being much lengthened in the process of blooming, and the flower season greatly prolonged.

A good collection of *Funkias* is also grown here, the foliage adding much to the interest and richness of the grounds in May: *Funkia ovata*, *F. undulata* variegata, *F. alba marginata*, and *F. Sieboldiana*, were conspicuous.

Here, too, a strikingly distinct and handsome fine-foliage, bronze-leaved plant was noted, *Rodgersia podophylla*. The plant was not yet in bloom; but its long-stemmed curious-shaped leaves, reminding of a bronze-coloured Rhubarb, forming into a sort of crown of four leaflets on the surface, is a new feature in form and colour among herbaceous plants at this season of the year. It is a native of Japan, and was introduced in 1800, though it is seldom met with in gardens or landscapes. Among the fine collection of Saxifrages in bloom, among the most distinct and showy were *S. purpurascens*, *S. pectinata*, *S. aizoon*, and *S. sarmentosa*. *D. T. P.*

CARNATIONS AND PICOTEES AT MESSRS. J. VEITCH & SONS, CHELSEA.

The usual display of these favourite flowers is now at its best at the Royal Exotic Nursery, and numerous novelties were noted in the collection. All of what are best among older varieties are to be found, and for these we must certainly claim a preference; the plants in most instances being of short growth with robust habit, plenty of shoots, great floriferousness, and flowers that endure bright sunshine without injury for a long period of time.

Of novelties, good flowers were remarked of the selfs Garville Gem, a heliotrope-coloured flower, and the plant of better constitution than Theodore, besides being free of growth; Her Grace, a delicate flesh colour changing to white, large and full, and capital, as seen under glass; Sea Gull, also flesh-tinted, of fine form, and robust; and Sweet Briar, pale red with finely formed petals and flowers, which are of great size. New yellow ground Picotees were noted in Eldorado, a large, perfect flower, edged with rosy-red; Golden Eagle, a richly tinted flower edged with red, and of great size; Voltaire, a large full flower, distinctly edged with rose-pink.

Carnations of recent introduction, and mostly of Mr. Martin Smith's raising, were Cardinal Wolsey, a yellow-ground flower of the Victory type, but much superior in form and colour; Duke of Orleans, a large yellow flower of excellent form; King Arthur, a very distinct crimson-scarlet bloom, the perfection of form; Princess May, of the Souvenir de la Malmaison type, deep rose-coloured, and of which type The Churchwarden is another. A very beautiful variety was likewise remarked in Waterwitch, a delicate flesh-coloured flower.

The collection affords a capital example of what may be done in a London garden with Carnations and Picotees, by intelligent cultivation.

Obituary.

JOHN FINLAY.—We regret to record the death, at the age of sixty-one years, of Mr. John Finlay, on Saturday, the 3rd inst., at Meldon Park Gardens, Morpeth. The deceased was a well-known gardener, whose days were chiefly spent in his native county, Northumberland, first at Netherwitton, with his father as a drainer, afterwards as a garden-

apprentice at Mitford Hall. After leaving Mitford, he came south to gain experience, and returned to the North about thirty years ago, to take charge of the gardens at Meldon Park, serving the late Mr. J. Cookson, Mr. J. Blencowe Cookson, and latterly, Mr. R. Clayton-Swan. The *Newcastle Journal* says, in its issue of the 6th inst., "As an authority on natural history, he was known throughout the country. When little more than a boy he made a well-nigh complete collection of all the flowers and plants to be found in the county. These were all beautifully mounted, named, and anything special about them carefully written down. Botany he relinquished, however, for entomology, which he pursued with enthusiasm till compelled this spring, through failing health, to cease collecting. For many years the half of his nights might be said to be spent outside in pursuit of his hobby. His cabinets contain over 1500 distinct species of British moths and butterflies, with many duplicates of all the leading varieties. As far as the North of England varieties are concerned, they are complete. The collection is justly considered one of the finest in the country in private hands. He leaves a widow, four daughters, and an adopted daughter."

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 13.—An ordinary meeting of the committee was held on Tuesday last in the Drill Hall, Westminster, when the exhibits were considerably less numerous than for some time past. Collections of hardy flowers were again staged by many firms, indeed, on this occasion, they formed the major part of the show, and the same species of plant was seen in most of them. These bunches of cut-flowers shown again and again are hardly so interesting as exhibits at these meetings of the Royal Horticultural Society ought to be. Very few novelties in plants were staged, but in a few instances awards were made as will be seen below. Orchids were few. Before the Fruit and Vegetable Committee there were shown a number of seedling varieties of Peas, a few new Melons, and a collection of vegetables, which deserves to be described in most appreciative terms, as it exhibited the result of very exceptional culture.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. Jno. Fraser, Chas. T. Drury, H. B. May, Chas. E. Shea, W. Bain, H. J. Jones, D. R. Crane, E. Beckett, Geo. Gordon, J. Fraser, R. M. Hogg, and Jas. Walker.

Mr. B. R. DAVIS, Yeovil, staged single blooms of double-flowered tuberous Begonias. Though the method of exhibiting them upon brown-coloured boards is not particularly tasteful, the blooms sufficiently indicated that many of the varieties in crimson, rose, pink, yellow, and white, were meritorious ones. An Award of Merit was recommended to the variety Miss Griffith, a large double, tinted white flower with a delicate obscure yellow centre, the margins of petals prettily crimped. Roland Yorke, a rather loose-flowered salmon-rose variety, and J. Davis, fine scarlet-crimson flower, deserve mention also. Of each of the three varieties last-named, a plant was shown (Silver Banksian Medal).

Messrs. H. CANNELL & SONS, Swanley, Kent, showed a group of double-flowered Begonias, consisting of plants five months old. These were in 5-inch pots, and carried a few good flowers upon each. From seed sown in February it is evidently possible to obtain medium-sized, well-flowered, decorative plants by July (Bronze Banksian Medal).

Ferns were again shown by Mr. H. B. MAY, Dyson's Lane Nurseries, Edmonton, in a group consisting of admirable but small specimens of a number of choice varieties. *Nephrolepis exaltata*, and the varieties *multiceps*, *furcata*, *pluma*, also *N. cordifolia*, and several varieties, *N. Duffii*, a dwarf-growing pretty species; *N. Philippine*, *N. recurvata*, *N. Barteni*, *N. rufescens tripinnatifida*, and others, illustrate the number of species shown. Aspleniums in endless variety were included, and a selection of species and varieties of the effective *Gymnogrammas* (Silver-gilt Flora Medal).

A group of plants of the magnificent white flowering *Watsonia Ardeni* was shown by Messrs. F. SANDER & CO., St. Albans. This beautiful Cape bulbous plant was noticed at the last meeting in the Drill Hall, when fewer plants were shown.

A beautiful collection of bunches of Sweet Peas was exhibited by Mr. H. ECKFORD, of the celebrated Wem Nurseries in Salop. Besides each bunch being representative of a choice and new variety, they were staged in the most tasteful manner. Mr. Eckford knows how to raise and cultivate Sweet Peas, and more than that, he knows how to display them to the best possible advantage.

Messrs. WM. PAUL & SONS, Waltham Cross, Herts, exhibited a nice collection of Rose blooms, some of them in bunches, and all representative of sorts sent out during the last few

years. Sylph (W. Paul & Son), a pink Tea, of pretty form, and moderate in size, was recommended an Award of Merit. A curiously-tinted Rose, named M. Ada Carmody, was pink, with a shade of straw colour on the inner side of the petals. Waltham Standard was shown, and the lovely new Rose, Marquise de Litta, Enchautee (Tea), Empress Alexandra of Russia, Milton (a crimson H.P.), White Lacy, and Zephyr (Tea), were some others.

Messrs. F. CANT & CO., Braiswick Nursery, Colchester, made a display with Rose blooms, some of the varieties being shown in admirable specimens. Such were The Bride, Madame de Watteville, Madame Rady, Madame Lombard, Ethel Brownlow, Mrs. Frank Cant, A. K. Williams, and others. Bunches of garden Roses were very showy (Silver Flora Medal).

Messrs. R. WALLACE & CO., Kilnfield Gardens, Colchester, had a pretty display of varieties of Lilies, and of Calochortus. A beautiful yellow variety named aurea, of the species *C. plumera*, was recommended an Award of Merit. It has a dull brown jagged ring across the centre petals (Silver Flora Medal).

Flowers of several varieties of hardy Nymphaeas were shown by Mr. J. HUDSON, gr. to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton. To one of these, named *N. marliacea alba*, a First-class Certificate was awarded; and an Award of Merit to *N. Ellisiana* (new), a crimson-flowered variety.

Lobelia tenulor grandiflora, shown by Mr. B. LADHAMS, was recommended an Award of Merit. It is a pretty, very free-flowering plant, slender in growth, with larger blue flowers than the type, and about 1½ foot high.

Sir T. LAWRENCE, Bart., Bursford, Dorking (gr., Mr. W. Bain), exhibited flowering racemes of *Salvia bicolor*. This hardy biennial species grows about 4 feet high, and produce many flowers upon each plant. The upper lip may be described as heliotrope-purple, the lower one nearly white. Mr. Bain informs us that the bees are very fond of it, and are apt to disfigure the blooms (Award of Merit).

Aristolochia brasiliensis, a flower of which was shown by A. KINGSMITH, Esq., Harrow Weald, was awarded a Botanical Certificate. The perianth in this species is much curved, and the lobe rather spreading, but the flower is not so pretty or even remarkable as others of the genus.

Carnation flowers in elegant bunches were shown by Mr. J. DOUGLAS, Edenside Nurseries, Bookham, Surrey. Many of the best and newer varieties raised by Mr. MARTIN E. SMITH, and Mr. DOUGLAS were shown. Awards of Merit were recommended to *Polegia* (Douglas), a most bizarre-looking flower of silvery-slate colour marked with very bright rose, Badmington yellow ground edged rose, of fine form; Sir H. Irving, a very dark crimson self; and Miss Violet Douglas, yellow ground, deeply and distinctly edged rose.

Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham, exhibited a large collection of hardy flowers in small bunches of a great variety of species (Silver Banksian Medal). Another excellent collection was from Mr. JNO. CHARTON, Tunbridge Wells (Silver Banksian Medal).

A third from Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea. And another from Mr. B. LADHAMS of the Shirley Nurseries, Southampton (Silver Flora Medal). The collection from Messrs. VEITCH & SONS was a very large one, and the species shown were represented by capital specimens. They had also a very pretty lot of Carnation blooms, and some magnificent flowers of varieties of *Iris Kämpferi* (Silver-gilt Banksian Medal).

Messrs. BARR & SONS, King Street, Covent Garden, London, exhibited, as usual, flowers of a great number of bulbous and hardy plants now in season (Silver Banksian Medal).

A First-class Certificate was awarded to a most ornamental Plant, shown by Mr. JNO. RUSSELL, nurseryman, Richmond, Surrey. It bears the much lengthened name of *Platanus occidentalis argentea variegata*, and many of the leaves are pure white, the young stems being nearly so. A freely-variegated and desirable variety.

HARDY FLOWERS IN COMPETITION.

Mr. C. HERRIN, gr. at Dropmore, Maidenhead, was 1st for twelve bunches of hardy flowers, and showed *Helianthus multiflorus* (double), an inflorescence of *Yucca gloriosa*, *Aconitum bicolor*, *Spiraea arifolia* (magnificent sprays), *Galega officinalis*, *Lilium candidum*, *Lathyrus grandiflorus*, *Lysimachia thyrsiflora*, Rose Crimson Rambler, *Aletrisera aurea*, *Achillea Ptarmica* fl. pl., The Pearl, and a seedling variety of Delphinium.

The 1st prize collection of eight bunches of hardy flowers was hardly so bold and good. It was shown by Miss DEBENHAM, St. Peters, St. Albans.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), S. Courtauld, De B. Crawshaw, H. M. Pollett, E. Hill, W. H. Young, H. J. Chapman, J. Douglas, A. H. Smee, F. Mason, E. Ashworth, and W. Cobb.

Compared with the fine displays made by the Orchids at previous meetings, there was a very small number of exhibits on the present occasion. Messrs. J. VEITCH & SONS, Ltd., Royal Exotic Nurseries, King's Road, Chelsea, staged a small group, in which were three plants of the new *Laelio-Cattleya* × *Canhamiana alba* (*L. purpurata* × *C. Mossii*). The large flowers had white sepals and petals, suffused with a very slight pearly-pink tint, the delicate hue of which contrasted most effectively with the dark crimson-purple of the ample labellum (Award of Merit). Messrs. Veitch also

showed *Laelio-Cattleya* × *Eunomia* (L. *pumila* × C. *Gaskelliana*), with flowers resembling those of *Laelia prestantia*, but larger; L. C. × *sephyra* (L. *xanthina* × C. *Mendellii*), with pretty yellow-tinted flowers; and two plants of the handsome *Diaa* × *Veitchii*.

Messrs. F. SANDER & Co., St. Albans, showed *Phaius* × *Ashworthianus* (Maunl × *maculatus*), with sepals and petals yellow, slightly tinged with green; lip yellow, with distinct brown markings on the anterior portion (Award of Merit); *Cypripedium* × *Svend Bruun* (Lowi × *Curtisii*), C. × *mulus* (*hirsutissimum* × *Lawrenceanum*), C. × *orphanum*, and C. × *Euryale*.

Frau IDA BRANDT, Brunnenhof, Klesbach, Zurich (gr., Mr. Schlecht), sent a cut spike of the fine old *Epidendrum nemorale* major, with showy, rose-coloured flowers borne on stiff, warty peduncles. Although first imported from Mexico over half a century ago, it is by no means a common plant, and the inflorescence represented a fine form of it (Award of Merit). Mrs. BRANDT also sent spikes of a fine form of *Oncotium* *Wilkinsonianum*, *O. nebulosum* *parviflorum*, *Epidendrum Brassavola*, *E. radiatum*, *Phaius Humboldtii*, *Cattleya Warscewiczii*, *Phalaenopsis violacea*, and the blue *Utricularia Andreana*, which, although not an Orchid, like many of its congeners, is usually associated with them in gardens.

ELIJAH ASHWORTH, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. Holbrook), showed his beautiful white *Cattleya superba* alba, the white C. *Eldorado* Wallisii, several fine forms of C. *Warscewiczii*, one of them resembling C. *Dowiana aurea* much in form, odour, and general appearance, although in colour it was a light form of C. *Warscewiczii*. Mr. Ashworth also showed cut examples of *Laelio-Cattleya* × *Mardellii* C. *Luddemanniana* × L. C. × *elegans* (gr.), raised by Messrs. Veitch & Son, first flowered by them in 1879, and still a very rare and pretty hybrid, with light rose-coloured flowers, having a broadly-expanded dark rose front lobe to the lip; and a flower of the new *Dendrobium Victoria Regina*, which, if only a botanical plant, is decidedly of the blue tint represented by the collector, and, when established, will be pretty enough.

Fruit and Vegetable Committee.

Present: T. Francis Rivers in the chair; and Messrs. Geo. Bunyard, P. C. M. Veitch, Jos. Cheal, A. H. Pearson, Alex. Dean, G. H. Sage, Geo. Wythes, C. Herrin, and H. Balderson.

A first class collection of vegetables, shown by Mr. E. Beckett, gr. to Lord ALDENHAM, Aldenham House, Elstree, was awarded a Gold Medal. The heaps of vegetables (for they were not dishes) were really capital—clean, even, of the very best quality; and, excepting a few Mushrooms, we may say that not one of the vegetables was weak. There were upwards of thirty of these heaps, and of course most of them were of distinct varieties. It is hardly necessary to repeat them here, for the interest in the exhibit was due to the successful cultivation they had received rather than to the varieties themselves.

Several seedling Melons were shown, and one of these, named *Syon Perfection*, shown by Mr. Geo. WYTHES, Syon House Gardens, was recommended an Award of Merit. It is of medium size, much-netted greenish-yellow exterior. Flesh scarlet; flavour full, and very juicy. The awards to new Melons have so far been few this season.

An Award of Merit was also recommended to the "Logan Berry," or Strawberry-Raspberry, sprays of which were shown by Messrs. Geo. BUNYARD & Co., Maldstone. It is from America, grows about 2 feet high, and the fruits are long, rather thin, and acid. Seedling Peas were shown by Messrs. R. VEITCH & Son, Exeter, and Mr. ECKFORD, but no awards were made.

Messrs. W. W. JOHNSON & Sons were awarded a Silver Bankian Medal for a collection of Peas embracing about fifty varieties; and Messrs. CARTER & Co., High Holborn, obtained a similar Medal for a collection of Lettuces and Turnips.

Mr. W. Allan, gr. to Lord SUFFIELD, Gunton Park, Norwich, sent some excellent fruits of a dark coloured Strawberry, Lady Suffield.

Cherries were exhibited in most tempting appearance by Messrs. T. F. RIVERS & Son, Sawbridgeworth. These were presumably the result of orchard-house culture, and all of the score or so of varieties were very fine. We may instance Early Rivers and Monstreuse de Mersel (Silver-gilt Knightian Medal). The flavour, however, was defective.

Gooseberries in pots were shown by Messrs. Jas. VITCH & Sons, Chelsea, who had about forty plants, which had been potted up last autumn. These plants illustrated the methods of training Gooseberry bushes, viz., the horizontal, cup-shaped, pyramidal, and standard. The stands da were about 4 feet high, and are grafted on *Ribes aurea*. Fruits of the new and highly-flavoured Strawberry, Veitch's Perfection, were also shown (Silver-gilt Knightian Medal).

The Lecture.

In the afternoon the Rev. GEO. HENSLOW delivered a lecture on the "Mutual Accommodation between Plant-organs."

After a few remarks upon the accepted theory of evolution, being equally true in regard to the race as it is in the case of the individual, reference was made to protoplasm, and its capabilities and character were briefly stated. Protoplasm can make all kinds of organs in plants, and although commonly it does so regularly, and according to certain rules, it nevertheless possesses the power to respond to changes in the plant's environment, and to make quite

different organs than regular ones, according to requirement. Next it was explained how the organs of a plant are for convenience sake classed into groups, viz., the axile organs, and the appendages. Any part of the stem or root belonged to the first-named class, but the leaves, flowers, &c., to the appendages. The terms "analogous" and "homologous," as applied to plant organs, were then described, the former term expressing a case of superficial resemblance where two organs of different nature are used for a similar purpose, and the second where the two organs are alike in character and origin. Turning to speak of the organs individually, the Professor pointed out that roots were fundamentally the same as stems, but altered to suit the plant's requirements.

Several illustrations were next given of instances where the living protoplasm had enabled the root to change in character according to changed conditions. The Carrot had become a large-rooted biennial from a slender-rooted annual. The ease in which roots under certain conditions will produce stems, and vice versa, are matters well known to our readers, and they were illustrated by examples submitted by Professor Henslow.

In speaking of stems, the lecturer showed how capable they were of doing the same work that roots do, and of making roots. Every gardener who has rooted a cutting has observed an instance of the protoplasm in a stem making a root. Though the tubers of a Potato under natural conditions are produced under ground, if these are continually removed as they are formed, the plants will make a number of tubers in the axils of the stem above the ground. The methods by which plants are enabled to climb was next alluded to, and the well-known circumstance that most of the organs are utilised in one case or another for the purpose fully illustrated. In cases like the Hop or Convolvulus, the stem itself is sensitive, and winds round and round an object of resistance, but in other instances it may be the petiole of the leaf, or part of the inflorescence or tendril that is delegated by Nature to assist the plant to climb.

Many illustrations from specimens were given, including one in which a root had climbed several times around an object. In speaking of leaves subsequently, Mr. Henslow showed how occasionally stems discharged all the functions of leaves, such as transpiration, &c., and instanced the *Stapellias*. The stipules served all manner of purposes in different species, according to the requirements of the plant. Follicleous in the Pea, they form formidable horns in some of the *Acacias*.

Bud scales were remarked upon, and their different origin in diverse species pointed out. The inflorescence and reproductive organs showed the same principles of adaptation to necessary conditions. Bracts were generally arrested leaf-stalks, but not always. Colour was usually centred in the corolla, but numerous instances were illustrated where this is not so, when indeed the colour is independent of the flower, typical specimens being the *Poinsettia* and *Cornus*. The latter also mimicked a flower, and were often mistaken for white petals. All these bracts are homologous, with leaves. The change of stamens into petals, and the production of petals in the place of ovules, was illustrated.

The numerous illustrations and dried specimens submitted by the lecturer added much to the interest of the subject. The facts were these, that though many plants climb, they do so by very different means. Most plants have colour wherewith to attract insect agents of fertilisation; but for this and most other purposes one organ is used by one plant, and a different one by an opposite species. Thus throughout plant-organs is seen this "mutual accommodation."

TUNBRIDGE WELLS.

JULY 7.—The thirty-ninth meeting of the above Horticultural Society was a success, as usual, but we noted a great falling off in fruit.

For four stove and greenhouse plants, Mr. N. Turner, gr. to J. A. LE LACHEUR, Esq., The Wilderness, Tunbridge Wells, was well in front of Mr. J. Mason, gr. to H. J. WOOD, Esq., Tunbridge Wells. Mr. L. Pope, gr. to J. J. BARROW, Esq., Holmwood, won for ornamental foliage-plants, and also for six stove and greenhouse plants in bloom, and for four ditto, but was beaten by Mr. J. Mason for six ornamental foliage-plants in the local classes. Mr. L. DUPOND was 1st for six single, and Mr. C. DUNK for six double-flowered Begonias. Some really grand *Caladiums* came from Mr. N. Turner, gr. to J. A. LE LACHEUR, Esq.

Groups were good, the 1st and 2nd going to Mr. J. Howes, gr. to W. COBB, Esq., Dulcote, and Mr. J. MASON.

Orchids were excellent, especially the well-flowered pieces of *Epidendrum vitellinum* major, *Laelia tenebrosa*, *Cattleya Mendellii*, *Miltonia vexillaria leucoglossa*, and *Cypripedium bellatulum*, from Mr. J. Howes.

Roses were fairly good, and numerous. Messrs. F. CANT & Co., Colchester, and Mr. G. MOUNT, Canterbury, were 1st and 2nd in the classes for forty-eight varieties, and for twelve Teas or Noisettes.

Mr. Salter, gr. to T. B. HAYWOOD, Esq., Reigate, and Mr. Harris, gr. to E. M. BETHUNE, Esq., Horsham, were the most successful among amateurs. Mr. G. Elwes, gr. to Major F. LUTWIDGE, was the chief winner in the local classes.

Mr. G. Elwes secured the National Rose Society's Bronze Medal for *Alfred Colomb*; and Mr. G. MOUNT a similar award for *Duchesse de Morny*.

Fruit.—The best three bunches of Black Hamburg Grapes came from Mr. C. EARL, gr. to O. E. d'AVIGNON Goldewid, Esq., Tonbridge; the best three bunches of any

other black Grape being *Gros Maroc* from Mr. LAKER, who also won for three bunches of *Muscat of Alexandria*.

Mr. C. EARL was a long way ahead for a collection of nine varieties, and staged a really good lot.

There were some excellent non-competitive exhibits; especially so being a grand lot of herbaceous cut flowers from Mr. CHARLTON, Tunbridge Wells.

IPSWICH AND EAST OF ENGLAND HORTICULTURAL.

JULY 7.—A timely change in the direction of this Society has given a new lease of life to one of the oldest and best-known horticultural institutions in the eastern counties. A Society that existed so n after the Queen ascended the throne should claim support by its long record of operations; and the infusion of new blood to the committee is working in a highly satisfactory manner. The exhibition, held on this occasion in the delightful grounds of the Upper Arboretum, was undoubtedly the best ever held by the Society. Three large marquees were required; some of the exhibits, especially among the cut flowers, were of a high order of merit.

In a part of the country where the Rose is so largely cultivated, it was only natural it should be a prominent feature at Ipswich. The best collection of thirty-six varieties came from Mr. B. B. CANT, Colchester, who staged some high-class flowers, the most prominent being *Duchesse de Morny*, *Marchioness of Londonderry*, *Star of Waltham*, *Suzanne-Marie Rodocanachi*, and Mrs. John Laing. Mr. B. B. Cant was also 1st for twelve varieties, three of each, having *Baroness Rothschild*, Mrs. John Laing, *Her Majesty*, &c., in fine character; Messrs. D. PRIOR & Son were 2nd in each case.

Messrs. PRIOR & Son were 1st with twelve Teas and Noisettes, Mr. B. B. CANT being a very close 2nd.

The best six H.P. Roses of any one variety were Mrs. John Laing, from Messrs. D. PRIOR & Son. Messrs. PRIOR & Son also had the best six Teas, staging *Maman Cochet* in fine character.

Garden Roses, shown in bunches of six varieties, were a charming feature. Mr. A. C. GREEN was 1st with delightful bunches; Mr. A. Andrews, gr. to the Hon. W. LOWTHER, was a good 2nd; a fine bunch of *Crimson Rambler* was in this stand.

In the amateurs division, the Rev. A. FOSTER-MELLIAR was 1st with twenty-four varieties, and the Rev. H. A. BERNERS, 2nd; and with twelve varieties, the Rev. A. C. JOHNSON, Capel St. Mary, was 1st, and D. C. WARNER, Esq., Eye, 2nd; with twelve Teas, the Rev. A. FOSTER-MELLIAR was 1st, and the Rev. H. A. BERNERS, 2nd. The best six Roses of any H.P., were *La France*, from the Rev. A. FOSTER-MELLIAR; with twelve Teas, the Rev. H. A. BERNERS was 1st with *Maman Cochet*.

A very fine display of hardy herbaceous flowers were made. One leading class was for a collection most tastefully arranged on a table 8 feet by 3 feet, and here Messrs. WALLACE & Co., Colchester, were placed 1st with a unique display, having various interesting species of *Lilies* at the back, against *Palms*, and in the foreground *Calceolarii* in variety; between these were such things as *Alstroemeria*, *Hemerocallis aurea major*, very fine, and other novelties; Mr. C. JACOB, Ipswich, was 2nd, also with a remarkably good collection.

With twenty-four bunches, Mr. GEO. GILBERT, nurseryman, Ipswich, was 1st, having very fine and imposing bunches.

Sweet Peas in bunches were an excellent feature; Mr. J. GILBERT was 1st with a charming assortment, well set up.

Mr. G. GILBERT was the only exhibitor of four foliaged plants, and was 1st for a group of plants arranged for effect. The best group of Begonias arranged with foliaged plants came from Mr. S. W. SWEET, a working man of Ipswich, beating the local nurserymen. There was also a class for groups of *Gloxinias* similarly arranged. Mr. SWEET also had a 1st prize for twelve tuberous-rooted Begonias, admirably grown and bloomed. The best four Exotic Ferns came from Mr. GILBERT; and Mr. MESSENGER, The Gardens, Woolverstone Park, had the best six table-plants.

FRUITS.

Mr. MESSENGER won 1st prize for six dishes of fruits; he had good Black Hamburg and Buckland Sweetwater Grapes, Pineapple Nectarine, Bellegarde Peach, Brown Turkey Figs, and Freston Tower Melon.

Mr. W. Howbett, gr. to Dr. CABLEY, had the best three bunches of Black Hamburg Grapes, well-coloured; Mr. ANDREWS was 1st with two bunches of white Grapes, having well-coloured Buckland Sweetwater.

The best dish of Peaches was *Bellegarde*, from Mr. MESSENGER; and his was also the best dish of Nectarines, having good Pine-apple. Black Cherries were represented by *Tartarica*; white, by *Bigarreau Napoleon*. The best dish of Strawberries for weight was *Latest-of-All*, from Mr. MESSENGER; the best for flavour, British Queen. Mr. H. ROSE had the best collection of six dishes, staging *Royal Sovereign*, *Latest-of-All*, *Loxford Hall Seedling*, *Carolina Superba*, *Sir J. Paxton*, and A. F. BARRON. Raspberries, red, white, and black Currants, Gooseberries, &c., were plentifully shown.

Special prizes for vegetables offered by Messrs. SUTTON & Sons, WESS & Sons, DANIELS Bros., F. SMITH & Co., and W. ADDISON brought a very good display indeed; in other classes they were seen to good advantage.

WIMBLEDON HORTICULTURAL.

JULY 7.—The twenty-fifth annual exhibition of this Society, held in the grounds of Draxmont House (T. E. Crocker, Esq.), on the above date, was a success financially and horticulturally.

To refer briefly to two of the leading classes:—Group of miscellaneous foliage and flowering plants, quality and effect combined (open class). Here 1st honours were gained for a pleasing group set up by Mr. W. Thornton, gr. to T. E. Crocker, Esq., Draxmont; a good 2nd being Mr. J. Low, gr. to Rosser Dean, Esq., The Priory.

Interest attached to the class in which prizes were offered for a miscellaneous group, confined to single-handed gardeners residing in the district, the awards going for meritorious contributions to Messrs. T. CHANDLER and F. KILBON.

HANLEY HORTICULTURAL FÊTE.

JULY 7, 8.—The first horticultural show held in the New Park, Hanley, took place on the above dates. The Park itself is well adapted for a large show, and under the able secretaryship of Mr. J. Kent, the Park Superintendent, and Mr. J. B. Barrow, assistant town clerk, a very satisfactory exhibition was brought together. The attempt to establish a large annual horticultural exhibition in the Staffordshire Potteries deserves success. The prizes were sufficiently encouraging to bring exhibitors from widely different parts of the country. The groups were five in number, and were arranged in first-class style. The fruit, too, was an excellent feature, and attracted a great deal of attention. Unfortunately some of the dishes of fruit were removed immediately after the judging, and other dishes substituted; thus the judges' awards were severely criticised by the public. The committee should prevent a repetition of this practice, and whatever the interest at stake may be, all exhibits for competition should remain, as staged, until the close of the show. The following are some of the principal awards:—

Group of Plants arranged for Effect.—1st, Messrs. JENKINSON & SON, Newcastle, Staffordshire, whose group was tastefully arranged, and contained a number of well-flowered Orchids, and such plants as Bamboos, Caladiums, Crotons, and Ferns. The excellence of this group was such that it won from Mr. J. CYPHER, Cheltenham, who was 2nd.

The best group of Orchids arranged for effect was from W. THOMPSON, Esq., Walton Grange, Stone (gr., Mr. W. Stevens). This was a superb collection, and contained some very fine specimens. Mr. J. CYPHER was again 2nd.

Specimen Plants.—C. H. WRIGHT, Esq., Halston Hall, Oswestry, was 1st for six Exotic Ferns, showing fine specimens of *Adiantum Williamsii*, *A. concinnum*, and *Davallia filix-foemina*.

For six plants in flower and six fine-foliage plants, Mr. J. CYPHER was 1st, with excellent specimens. Mr. CYPHER was likewise 1st for eight Exotic Orchids, and six Palms, distinct.

The best twelve Caladiums were from J. F. MADDOCK, Esq., Alsager (gr., Mr. Smith).

Roses.—The best collection of forty-eight distinct varieties was from Messrs. ALF. DICKSON & SONS, Newtownards, Ireland, whose stand contained several new varieties of their own raising. Amongst the best were *Souvenir d'Elise*, *Altes Grahame*, *Innocente Pirola*, *Souvenir de S. A. Prince*, *Marie Van Houtte*, new Seedling (Lady), *W. Beattie Brown*, *Helen Keller*, and new Seedling (*Daison Maroon*). 2nd, Messrs. HARKNESS & SON, Bedale, Yorks, whose stand had fine blooms of *Prince Arthur*, *Fisher Holmes*, and *Horace Vernet*. Thirty-six distinct varieties, three blooms of each, were best from Messrs. HARKNESS & SONS, whose stands had fine trebles of well-known varieties.

Messrs. TOWNSEND & SON were 1st for twenty-four distinct varieties, and Messrs. DICKSON & SON, Ireland, for twelve blooms, distinct varieties. For twelve distinct Teas in trebles, Messrs. TOWNSEND & SON competed with most success.

The most decorative arrangement of Roses was made by Messrs. JENKINSON & SON, Newcastle; and the same firm had the best display of floral arrangements.

Fruit.—For a collection of nine dishes of fruit, the Earl of HARRINGTON (gr., Mr. Goodacre), and Lord BAGOT (gr., Mr. Bannerman), were equal 1sts. Mr. GOODACRE's collection contained a Pine, Foster's Seedling, and Black Hamburg Grapes, Royal George Peaches, Lord Napier Nectarine, Reine Hortense Cherries, Brown Turkey Figs, Royal Sovereign Strawberries, and Hero of Louisa Melon. Mr. BANNERMAN staged Black Hamburg and Foster's Seedling Grapes, President Strawberries, Brown Turkey Figs, two Melons, Downton and Lord Napier Nectarines, and Royal George Peaches. The Grape classes were fairly well contested.

Six Peaches were best from G. MEAKIN, Esq., Crosswell Hall, Stafford (gr., Mr. Wilks); and the Duke of SUTHERLAND, Trentham (gr., Mr. P. Blair), was 2nd.

For an equal number of Nectarines, the Earl of CARNARVON, Brethly Park (gr., Mr. J. Rad), was 1st; and the Duke of SUTHERLAND 2nd.

Other classes were for Melons, Cherries, Strawberries, Gooseberries, and Tomatoes.

Vegetables.—A collection of nine distinct kinds of vegetables was best from Lady THEODORA GUEST, Inwood House, Blandford (gr., Mr. Wilkins), who staged fine samples of

Onion Record, French Bean Canadian Wonder, Cauliflower Magnum Bonum, Cucumber Prolific, Potato Ringleader, Pea Duke of Albany, Carrot Model, Tomato Perfection, and Green Globe Artichoke. The Earl of CARNARVON was a good 2nd.

There were numerous classes for residents in the pottery towns, and for gardeners and amateurs resident within 25 miles of Hanley Town Hall.

Non-competitive Exhibits.—These contributed largely to the display of cut flowers and small decorative plants. Mr. H. ECKFORD, Wem, staged fifty varieties of Sweet Peas.

Messrs. DICKSON, Chester, showed a fine collection of 150 bunches of herbaceous cut flowers, for which a Gold Medal was awarded.

Messrs. COWAN & SON, The Vineyard, Garston, Liverpool, staged a fine collection of Tea Roses in pots, numbering sixty varieties, also a fine arrangement of tuberous Begonias, Orchids, Ferns, and Caladiums, the grouping of which was most effective.

Messrs. CLIBBAM & SON, Altrincham, sent a collection of herbaceous plants, also a collection of stove and greenhouse plants for table decoration.

Messrs. WEBB & SONS, Stourbridge, sent a collection of cut flowers.

Messrs. W. & J. BIRKENHEAD, Sale, Manchester, exhibited a stand of Ferns, containing a great number of varieties, the whole occupying the entire end of one tent, and proving a source of considerable interest. A Gold Medal was awarded for this exhibit.

DURHAM, NORTHUMBERLAND, AND NEWCASTLE BOTANICAL AND HORTICULTURAL.

JULY 8, 9, 10.—This old-established and well-managed northern Society held its annual exhibition on the above dates at Newcastle. Fine weather only was needed to make it a success. Scarcely so extensive as on some previous occasions, perhaps, the show was one of exceptional excellence. Notably was this the case in regard to fruits, Roses, hardy herbaceous flowers, floral decorations, Panicles, and Violas. There were several good exhibits of plants, but there were fewer good flowering plants than usual.

PLANTS.

The only exhibits of stove and greenhouse flowering plants were from Mr. Nicholas, gr. to the Marquis of Zetland, Upleatham, Marsh-by-the-Sea; these were, however, excellent examples of specimen plant culture, and well deserved the two 1st prizes awarded for six and for four varieties in two respective classes. These consisted of two big specimens of *Anthurium Scherzerianum*, one a specially fine form with grand spathe; two *Dipladenias* in good condition, well flowered, and with healthy foliage; two *Ixoras*, viz., *I. Moorei*, and *I. Williamsii*, were both alike capital plants. Other good plants were *Aphelaxis macrantha* roses (now rarely seen), very fresh and bright; *Erica ventricosa* Bothwelliana, a fine late pale coloured form of this section, and *Statice profusa*, very well coloured.

The foliage plants consisted chiefly of Palms, prominent amongst which were the *Kentias*, *Cycads*, and *Crotons*. For six varieties Mr. McIntyre, gr. to Mrs. Pease, Darlington, beat Mr. Nicholas, having larger plants, the best in the winning six were *Croton angustifolius*, a fine plant, and *C. Baronne Jaa de Rothschild*, a splendidly coloured example, with fine *Kentia* *Belmoreana* and *Cycas circinalis*.

In the class for four plants Mr. Nicholas had a splendidly coloured *Croton* *Warreni*, with other good examples.

Mr. McIntyre had the three best *Crotons*, medium-sized plants, and the best trio of *Dracenas*, well coloured useful examples. For table plants Mr. McIntyre was easily 1st, showing a well furnished, clean, and bright half dozen.

Groups, &c.—In these there is room for improvement, the exhibitors not appearing to have well considered what they were going to accomplish beforehand. Mr. McIntyre had the best group, informal in design, well broken up, with rather too many foliage plants in proportion to the flowering ones; and too much virgin cork was also apparent. Mr. F. EDMONDSON, Green Market, Newcastle, was 2nd, but the beautiful effect which he had produced in the foreground was entirely marred by the staging at the back. For arrangement of plants for fireplace decoration, Mr. J. LAWLESS, gr. to J. LIDDELL, Esq., Frudhoe-on-Tyne, was placed 1st, a close competition, the base and the mantelpiece being alike good.

CUT FLOWERS.

Roses.—Outside the National Rose Society's Exhibition at the Crystal Palace, it is not often that finer displays are made than at Newcastle. The northern Roses are characterised by freshness and brightness. On this occasion a special class for a "collection of Roses, arranged for effect in a space 10 feet by 4 feet, with Palms and other foliage plants," brought out three good exhibits. When we state that Messrs. PERKINS & SONS, of Leamington, were placed 1st, a sufficient guarantee is given that the display was a good one. This exhibit exemplified what can be done with the Rose in bouquets (of which there were several, quite distinct), in baskets (tastefully arranged), and in boxes of specimen blooms, &c., all being well displayed. Messrs. HARKNESS & SONS, Bedale, were 2nd.

In the usual Rose classes, Messrs. HARKNESS & SONS were to the front with grand blooms, bright, clean, fresh, and of full size; and, above all, well set up. This firm was first for seventy-two singles, in thirty-six varieties; for forty-eight

disimilar, for thirty-six ditto, and for twenty-four ditto in triplets, thus carrying off all the chief prizes. The finest blooms in these exhibits were Her Majesty, Dupuy Jamain, Marchioness of Londonderry, Horace Vernet, La France, Fisher Holmes, Reynolds Hole, Mrs. J. Leing, Captain Mogul (extra fine), Jean Liabaud, Star of Waltham, Grand Hayward, Victor Hugo, Marie Van Houtte, John Stuart Mill, Gustave Figeau, Rowland Hill, Mdlle. Marie Rady, Countess of Oxford, Marie Verdier, Marie Baumann, Marquise de Litta, Ernest Metz, Mary Dickson, and Prince Arthur, northern Rose growers will do well to note these kinds.

Messrs. MACK & SON, Catterick, showed in one or more of these classes, staging smaller, but bright and fresh, blooms. In the class for twelve blooms of one variety, Messrs. R. MACK & SON were 1st with splendid blooms of *Madame Caroline Testout*; and Messrs. HARKNESS & SON followed with the same variety.

The amateur rosarians of the north showed well, as at previous exhibitions; Mr. R. PARK was 1st for twelve triplets, fine well-developed flowers; and Mr. FINLAY, East Layton Hall, 2nd; Mr. PARK winning again with twelve singles.

Hardy Herbaceous Flowers.—Of these there was a grand display, the bunches in most instances being of unusual size, and in very fresh condition. Messrs. J. COCKER & SON, Aberdeen, were 1st for eighteen varieties showing typical border flowers; the finest bunches were those of *Inula glandulosa* (extra fine), *Campanula glomerata*, *Scabiosa caucasica*, *Dictamnus Fraxinella* var. *alba*, *Heuchera sanguinea*, *Iris* (Spanish) *Belle Chinoise*, and *Spiraea macrophylla*.

For twelve varieties, Mr. CAMPBELL of High Blantyre was 1st. *Lilium Harriell* was very good, and *Inula glandulosa* fine.

Panicles and Violas.—Not only was the competition keen, but the several stands were of the highest order of merit. Mr. CAMPBELL had the best forty-eight fancy Panicles, the blooms quite fresh, and of extra size; Mr. ALF. LISTER, Rothsay, being 2nd. Mr. LISTER was 1st, however, for twenty-four show Panicles, the colours being bright, and the selection good.

Mr. CAMPBELL had the best of the competition in the class for Violas in not fewer than fifteen varieties. In Mr. CAMPBELL's stand the best were *Duchess of York*, *Iona*, *Lizzie Paul*, *Lord Salisbury*, and *Dorothy*.

In the Second Division, Mr. DAVISON, Dalton, was 1st for twenty-four fancy varieties; and Mr. PROUDLOCK for twelve, both staging well.

Carnations.—These consisted chiefly of flowers from under glass or from plants in pots. Messrs. LAING & MATHER, of Kelso, were 1st for twelve bunches of not fewer than six blooms in each bunch, to be set up in specimen glasses, thus arranged making a good display; the best were of the *Malmesdon* section (pink and bluish), with other standard kinds, as *Uriah Pike*, *Germania*, &c.

Decorative arrangements of Flowers.—As usual, this department was well sustained, the taste displayed being good, and the method of arrangement by the Committee all that one could desire in order for the exhibits to be seen to advantage.

Messrs. PERKINS & SON were 1st for Bouquets, in all the four classes, showing in their usual good style.

Mr. T. BATTENSBY beat Messrs. PERKINS & SON for a lady's spray, with a charming combination of miniature *Rosebuds* and light foliage, without any Orchids, upon which Messrs. PERKINS & SON relied, but with less success.

Messrs. PERKINS & SON were again to the front with baskets of flowers, in two classes.

FRUIT.

In the larger class, for eight dishes, Mr. McIndoe, gr. to Sir JOSEPH PEASE, Hutton Hall, was a good 1st, showing what is most essential, well-ripened fruit. His best dishes were those of Black Hamburg and Muscat Grapes, Darwin Nectarines, Negro Largo Figs, Beacon Pears, and Bellegrape Peaches. Mr. TULLETT, gr. to Lord BARKARD, Raby Castle, was a good 2nd, his best dishes being very fine Black Hamburg Grapes, Dr. Hogg Peaches, and Lord Napier Nectarines.

For four dishes, Mr. McIndoe was also 1st, with similarly good dishes, Stanwick Elrige Nectarines being notable.

Mr. TULLETT had the best exhibit in the class for four bunches Grapes in not fewer than two varieties, showing very fine Black Hamburgs and good Madrasfield Court.

Mr. McIndoe had the best Muscats in the class for that Grape, and also for any other white with Duke of Buccleuch.

Mr. Luke Thompson, gr. to A. GUTHRIE, Esq., Low Fell, had a fine exhibit in the class for Black Hamburg Grapes, Mr. McIndoe being 2nd; both exhibits, however, were a little deficient in colour.

For Peaches, Mr. Lonsdale, gr. to R. H. APPLETON, Esq., Woodside Hall, was 1st, with well-coloured and ripened Royal George, Mr. NICHOLAS being 2nd with the same kind.

For Nectarines, Mr. TULLETT was 1st with Lord Napier and Mr. McIndoe 2nd with Darwin. //

MANCHESTER ROYAL BOTANIC.

JULY 10.—This was the best exhibition of Roses that has been held for years under the auspices of the Royal Botanic Society. Not only were the premier classes of both nurserymen and amateurs more numerously filled, but the blooms were of superior quality. The North of Scotland and Ireland were not represented so well as usually, but the Midlands and the south came out strong both in numbers and quality.

In regard to effective exhibition, Messrs. PAUL & SON, with a wealth of bloom not staged for competition, caught all eyes. The groups placed together in hampers were splendid, but a little marred by the rough outline of the wicker-work, too much like the rough-and-ready business of Covent Garden. These, together with the exhibits of WM. PAUL & SON, made grand centre pieces in the annexe, breaking up the extreme formality of the straight lines of the competition square cases. Then, again, the great variety brought in to make up the class under the heading of "Display of Roses" told well, and kept the visitor chained to the area of the exhibit.

Nurserymen.—Sixty distinct single trusses.—Mr. B. R. CANT, Colchester, 1st, with blooms of extra quality; Messrs. HARKNESS & SON, Hitchin, had 2nd prize. The best blooms in this lot were A. K. Williams, Thomas Mills, Comte Raimband, Pride of Waltham, Duchess of Bedford, Merveille de Lyon, Victor Verdier, Mammon, and Lady Fitzwilliam.

For thirty-six distinct single trusses, Mr. B. R. CANT was again 1st. The following were the best blooms: Ulrich Brunner, Marchioness of Londonderry, Victor Verdier, A. K. Williams, Helen Keller, Her Majesty, Dupuy Jamin, Madame Cusin.

For twenty-four Teas or Noisettes, single trusses, Mr. B. R. CANT was 1st, and included capital blooms of Madame de Watteville, and Bridesmaid. Mr. GEORGE PRINCE, Oxford, was 2nd. Maman Cochet is a splendid flower with good formed screw petals, Innocente Pirola, and Ethel Brownlow.

For twelve Teas or Noisettes, Mr. F. CANT was 1st, the best blooms being The Bride, Madame de Watteville, and Ethel Brownlow; Mr. JOHN MATTOCK, Oxford, 2nd.

For twelve blooms of a Yellow Rose, Mr. PRINCE was 1st; and for twelve light-coloured Roses, Mr. B. R. CANT was 1st with Her Majesty.

For twelve Crimson Roses, Mr. PRINCE was 1st with Reynolds.

Mr. GEORGE PRINCE obtained the Silver Medal for the best Tea or Noisette Rose in the show (open) with Maman Cochet.

Mr. LINDSELL, Hitchin, obtained the principal Medal for the best Rose in the show with a magnificent bloom of Horace Vernet.

Amateurs.—For the best twenty-four single trusses, Mr. E. B. LINDSELL, Hitchin, was 1st, and had flowers fully as fine as in any of the nurserymen stands, winning 1st here easily. His premier bloom, above noticed, of Horace Vernet, being of wondrous size and symmetry. In addition to that he had Duke of Edinburgh, H. Schultzeis, Rodocanachi, Marchioness of Londonderry, Merveille de Lyon, Chas. Lefebvre, Madame de Watteville, and others—a grand, clean, well-developed group, without a bad bloom. Rev. J. H. PEMBERTON, Essex, took 2nd place, having the following blooms good:—Chas. Lefebvre, Her Majesty, Mr. John Laing, Ulrich Brunner, Marchioness of Londonderry, Horace Vernet, and E. Y. Teas.

For twelve distinct trusses, Mr. LINDSELL was again an easy 1st.

For eighteen Teas or Noisette Roses, Rev. W. B. JACKSON, Bedford, took 1st position; Messrs. PEMBERTON and H. V. MACHIN following in order. The best blooms throughout were Madame Hoste, Marie Van Houtte, Catherine Marmet, Ethel Brownlow, The Bride, and Comtesse de Nadailac, one of the loveliest of the section, and invaluable as a show-Rose.

For twelve Teas or Noisettes, Mr. LINDSELL again triumphed; Messrs. PEMBERTON and MACHIN following, Caroline Kuster and Comtesse de Nadailac distancing fellow-blooms. Mr. LINDSELL took 1st position with Alfred Colomb, for a dozen crimson Roses, and also for light-coloured Roses; while the Rev. W. B. JACKSON had the premier award for a dozen yellows.

Messrs. WM. PAUL & SON, Waltham Cross, had a First-class Certificate for a new coloured Tea Rose called "Sylph." It is a mixture of bronze and salmon—good button-hole flower. This firm also obtained a similar award for "Queen Mab," a flower of a rather pleasing apricot colour.

Messrs. PAUL & SONS' non-competitive group was a large and varied one, put up on an octagonal platform. The group contained the following, not named in our report: Marie Baumann, Marchioness of Downshire, Lawrence Allan, Duke of York, and Grandeur of Cheshunt (fine rosy-crimson).

OTHER EXHIBITS.

Messrs. PERKINS, Coventry, had the best assorted lot of bouquets, the small Tea and Noisette Roses telling best among the Asparagus and other greenery.

Misses HOPKINS, Mere Cottage, Knutsford, put up a creditable lot of interesting and varied border flowers, for which they received an Award of Commendation. They also exhibited a seedling Pansy of sturdy habit in a pot, quite double—like a Ranunculus in form, only of Royal Blue colour, with the stamens turned into leaflets dashed with white colour.

Mr. HENRY ECKFORD, Wem, Shropshire, had, in addition to cut Roses, a nice and varied display of Sweet Peas.

It remains for us to say that Mr. P. Weathers, with his Lieutenant, Mr. Chas. Paul, was indefatigable in getting things righted for the popular gaze, and were rewarded with a far more numerous attendance than we have seen unless on our great gala days, the receipts sufficing to pay the prize-money and other expenses.

MALDON (ESSEX) HORTICULTURAL.

JULY 7.—The annual exhibition of plants, cut flowers, fruits, and vegetables, was held on the above date in the grounds of Hill House, the residence of D. C. BIXIE, Esq. The show was a most successful one. Fortunately the tornado which destroyed so much glass, and damaged garden and field crops in the neighbourhood of Chelmsford and other portions of Essex, did not affect the Maldon district.

Mr. H. Saltmarsh, gr. to Miss HART, Malden, was 1st for a group of miscellaneous plants arranged for effect. Double and single-flowered zonal Pelargoniums were shown in good condition by Messrs. SALTSMARSH, THOROGOOD, and PULFORD. Mr. E. Smece, gr. to Miss OXLEY PARKER, Woodham, Mortimer, had the best half-dozen Ferns out of three lots shown, staging fresh even-sized plants. Foliage plants, Begonias, cut flowers, fruits, and vegetables were of satisfactory quality in the various classes.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland N. Principal Wheat-producing Districts:—1, Scotland, E.; 2, England, N.E.; 3, England, F.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts:—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

** We are compelled to hold over a report of the Wolverhampton Horticultural Show until our next issue.

BEDS OF RHODODENDRONS, ROSES, &c.: L. S. We fear that having no agreement with the landlord in regard to the removal of the shrubs you have planted during your tenancy, you are required by law to leave them in the beds, if the landlord insists on his rights. If you deal in shrubs, that would alter the matter, all way-going stuff being then removable.

BOOKS: R. E. B. *The Scientific and Profitable Culture of Fruit Trees*, from the French of M. du Breuil (Lockwood & Co., 7, Stationers' Hall Court, London). *Fruit Culture for Amateurs*, by S. T. Wright, published by Upcott Gill, 170, Strand, W.C.

CUCUMBERS CURLING UP, &c.: Cucumber, Kingstown. The symptoms are those of eel-worms at the root, but you should send specimens of fruit, roots, and shoots for examination.

EEL-WORMS: V. D. Before deciding, you should send roots of plants growing in the soil that you suspect contains eel-worms. A soil from which every kind of food necessary to sustain eel-worms is absent is not likely to be the home of the worm.

LOSS OF FRUIT FROM PEACH TREES: C. W. H. The result, probably, of dryness at the root. Examine the soil of the border, and if it be found in a dry state as far as the roots extend, you may be sure that dryness is the true cause. Dryness of the soil is the cause of much ill-success with wall-trees. To it may be laid loss of wood and flower-buds, meagre growth of shoots and fruit, lack of flavour and of juiciness in the fruit, and premature ripening.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—J. W. Lilium Martagon. —H. K., L. Cummings. Lathyrus sativus, Chickling Vetch. —J. B. 1, Stanhopea insignis; 2, Stanhopea oculata; 3, Phaius grandifolius. —H. W. Echium vulgare. —G. H. Send your Roses to some nurseryman who grows them largely. —S. Klinkhardt. Stapelia capularis. A description of this plant will appear in our next issue. —W. J. C. Jasminum gracillimum and Cyrtopodium Stonei. —C. B. W. Cereus grandiflorus, an old species, and of no great value commercially. —H. A. Pteris adiantoides. —G. C. 1, Gnaphalium margaritaceum; 2, Veronica spicata alba; 3, Pentstemon barbatus; 4, Phalaris arundinacea variegata; 5, Campanula Trachelium album plenum; 6, Arundinaria Simoni aurea. —J. R. The flower was much withered, but it appears to be Gongora scapophorus. Many thanks for your interesting remarks about it. *Constant Reader.* Pyrus torminalis.

PEACHES THAT ALWAYS HAVE SPLIT STONES: Shanklin. The cause of this is not known with certainty, but it is usually attributed to some sort of check to growth, such as would be caused by great dryness of the soil, or excessive disbudbing, or much loss of foliage from the "curl;" in fact, the splitting of the stone in Peaches and Plums is just one of the matters of importance to gardeners which should form a subject for investigation in a research-garden, such as Chiswick might and ought to be.

RENTAL OF FLOREST'S SHOP: Florist. Why not consult a horticultural valuer, say Mr. J. Fraser, South Woodford, Essex; or Messrs. Protheroe & Morris, of Leytonstone, Essex, who would tell you within a trifle what such premises as those you contemplate taking may be worth to rent.

SITUATION IN THE LONDON PUBLIC PARKS: Parks. We should suppose that application made at the proper season (early spring) to the superintendent of any of these parks would suffice, provided it was backed by good testimonials, &c.

STARTING IN BUSINESS AS A GROWER OF MUSHROOMS: Mushroom. We are unable to advise. A capital of £100 is not much wherewith to start such a business, when you consider that you must meet a lot of expenses before getting any returns. There are rent of land and dwelling, cost of living, horse and waggon, stabling, some small amount of labour, baskets for sending Mushrooms to market, cost of stable-dung, spawn, &c.

STRAWBERRY AND "COPY" TRAINS: The number of special trains required just now for the conveyance of Strawberries is noted in the daily papers. We fancy from our own experience, that the gardening papers will soon have to charter a similar train to convey to their writers manuscript, the utilization of which is necessarily limited by considerations of space.

SWEET PEAS: T. P. What you send are Tares. It is not a case of reversion, but of mixed seeds.

THE

Gardeners' Chronicle.

SATURDAY, JULY 24, 1897.

ANDRÉ LENÔTRE.

THE name of Lenôtre is familiar in the mouth as a household word, but very little is known about the man himself, although he had, in addition to the gift of genius for landscape gardening, general talents of no common order. He was born in Paris in 1613, and died there in September, 1700, aged 87. Up to the age of 40, he remained "a youth to fortune and to fame unknown." His father was the chief royal gardener, and co-inspector of the palaces with Mansard, the famous architect, who constructed the dome of the Invalides and the Palace of Versailles. The father of Lenôtre rose to his distinguished position from being an humble gardener, and on his death he was succeeded by his son. The latter had seriously studied the fine arts in his youth, and he was a friend of Le Brun, the painter. Lenôtre was thus a landscape-painter as well as a landscape-gardener. It was Fouquet, one of the farmers of finance, who supplied Lenôtre with the opportunity for exhibiting his talents. Fouquet had just constructed his palace of Vaux-le-Vicomte, which outrivalled every royal residence in France, and that La Fontaine has celebrated in his fables. He commissioned Lenôtre to lay out the grounds and parks in keeping with the castle. He was limited to no sum.

On Louis XIV. visiting the mansion and its splendid surroundings, where gardening was raised to a fine art, His Majesty at once engaged Lenôtre to embellish Versailles. The latter had been a kind of shooting-lodge for Louis XIII. and his courtiers; his son, Louis XIV., retained part of the building, but the façade that has no equal in the world, and the chapel, were the chief new additions. The site was something between a marsh and a swamp. The palace cost, as is now known, 88 millions of francs, and the laying out of the grounds 34 millions of francs. Quite an army of labourers and soldiers was employed to level the ground, transport earth for the terraces, and convert the shaky land into firm soil. The most difficult part of the labour was the reclamation of a swamp that existed at the bottom of the terraces. By a stroke of genius Lenôtre converted it into a canal-lake, or *pièce* of ornamental water, extending into the distance, Triouwards. Then sprang up fountains, porticos, *treillages*, arbours, summer-houses, temples, mazes, &c. The Triouwards or lesser palaces followed, for it was the time when Louis loved flowers and Orange-trees.

Orders quickly arrived for the services of Lenôtre. The Duc d'Orléans, the king's brother, and husband of Princess Henrietta of England, entrusted him with the laying out of the palace-gardens and park of St. Cloud; the Prince de Condé secured his talents for Chantilly; Louis XIV. directed

him to further embellish St. Germain, and the famous terrace there was the result. Many would give the palm to the terrace at Richmond and the sweep of the Thames, with the rich woodland scenery of Buckinghamshire in the distance. Lenôtre created the delightful gardens fronting the lake at Clagny; he laid out Fontainebleau with its *parterre* and Tiber canals. He also planned the palace gardens at Meudon. Sceaux, &c., Greenwich and St. James' parks, and the Imperial gardens at Schoenbrunn, were also designed by the famous French gardener Lenôtre.

When Lenôtre submitted his plans for the gardens, grounds, and parks of Versailles, Louis XIV was wonder-stricken. After examining the first of the collection, he said: "Lenôtre, I present you with 20,000 francs;" he made the same reply after admiring the second and the third drawings. Then Lenôtre closed his portfolio, observing:—"Sire, I can show you no more, as I fear I would ruin you." A short time ago, I passed a delightful half-day in the Musée de Carnavalet examining these same beautiful drawings—real gems of art, as well as many other of Lenôtre's landscape sketches. They are as carefully executed and finished as pictures. But then Lenôtre was a talented painter, since some of his productions adorned the private apartments of Louis XIV.

Of all his creations, the Tuileries Gardens will remain the *chef-d'œuvre* of Lenôtre. Apart from being the place where his father was originally employed, and where he himself first learned the use of the spade, he had the most difficulties to surmount in dealing with the river front, and in the levelling up of the terraces and grounds. Upwards of 200,000 cubic feet of soil had to be employed for these ends. His original plan of the Tuileries Gardens has been much changed: thus, the central alley has been enlarged; more statues placed in the grounds, though not always in harmony with the groups of shrubs; buildings have been erected on the terraces; but the two great groups of Chestnuts that traverse the garden remain as they were planted by Lenôtre.

In 1678 Lenôtre accompanied the Duc d'Orléans and the Duchesse de Nevers to Italy. Louis XIV. desired to afford him opportunities for the widening of his ideas. He admits that he saw plenty of picture galleries and statues, but of landscape gardening nothing, and the best was inferior to what he himself had executed in France. Pope Innocent XI. took a great fancy to Lenôtre, for the latter was witty. He said to His Holiness that he had seen the two greatest personages in the world—"the king my master, and the Pope." "I am but a poor humble mortal beside your king," said Innocent, laughingly. "Not at all, Holy Father," replied Lenôtre, slapping him on the shoulder, and kissing him, "you will bury the whole college of cardinals." When the Duc de Crequi told Louis about Lenôtre embracing His Holiness, and his disbelief of the circumstance, His Majesty said—"Nothing more likely; he always embraces myself." Having become aged—eighty years—and feeble, Lenôtre implored the king to relieve him of his functions. After some hesitation Louis XIV. acceded, but on condition that he would visit him from time to time. About three years afterwards, Lenôtre was hobbling in the grounds of Marly; the king in his sedan-chair approached, welcomed his old servant, and ordered the carriers to bring also a chair for Lenôtre, so that they could be side by side and talk. "Why are you so silent and weeping,

Lenôtre?" "Sire, I'm thinking what would be my poor father's feelings were he to see me, side by side with the greatest king upon earth."

In 1675, Louis accorded Lenôtre letters patent of nobility, and wished to select for him a coat-of-arms. "I have selected it, Sire, a long time ago: three snails, surmounted with the heart of a Cabbage; how could I ever forget my spade, to which I owe all my fortune?" He was buried in the church of St. Roch, that is close to the Tuileries Gardens, in a side chapel that he had himself endowed.

Lenôtre was well read in the sciences; nearly the last act of his life was a report—and which is in existence, and very curious indeed to examine—addressed to the great Minister Colbert, recommending the adoption of Pascal's discovery, the wheelbarrow. C.

NEW OR NOTEWORTHY PLANTS.

STAPELIA CUPULARIS, *N. E. Brown, n. sp.*

ALTHOUGH, so far as I am aware, this plant has not been previously described, it is not a new introduction, as I first had it in cultivation in 1877, when the following description was made but never published, and since that time flowers of it from various sources have on several occasions passed through my hands. In a general way it much resembles *S. variegata*, but the erect, acute margin of the annulus at once distinguishes it from that and every other allied species.

Plant quite glabrous, except the margins of the corolla. Stems 2 to 3 inches long, 4 to 5 lines thick, obtusely 4-angled, angles with acute *s*, reading teeth. Cymes sessile, progressively 1 to 3 flowered. Pedicels $\frac{1}{2}$ to 1 $\frac{1}{2}$ inch long, about 1 line thick. Sepals $2\frac{1}{2}$ to 3 lines long, ovate-lanceolate acuminate. Bud pentagonal, flattened, with a short, blunt point, the sinistral angles projecting and slightly recurved. Corolla about 2 inches in diameter, with a saucer-shaped disc, ovate, acute, recurving lobes, ciliolate, with very short clavate hairs, and a nearly circular, cup-shaped annulus about 8 lines in diameter and 8 lines deep, with the margin erect and acute; the back of the flower is pale green tinged with purple, especially on the nerves, the face is slightly rugose, pale lemon-yellow thickly covered with dark purple-brown spots, which are often more or less confluent into irregular lines; the ground colour of the annulus is rather lighter than the rest. Outer coronal lobes $2\frac{1}{2}$ lines long, oblong, deeply bifid at the apex, with slightly diverging teeth, and a minute tooth at the base of the notch, pale-greenish yellow, dotted on both sides in the apical part with dark purple-brown, and on the upper side with a continuation of the dots down the centre, and a spot at the base; sometimes the margins only on the under surface are dotted. Inner coronal lobes two-horned, the horns equal, the inner erect, outer slightly spreading, both clavate, pale yellow dotted with purple-brown. The staminal tube under the corona marked with two distinct, or more or less confluent, bands of dark purple-brown. *N. E. Brown.*

ORCHID NOTES AND GLEANINGS.

FROM Mr. Joseph Broome, of Llandudno, we have received a bloom of *Cattleya Mendeli*, in which there were two sepals placed fore and aft, two petals placed right and left, and a straight erect column flattened from side to side, with two anthers in the same position as the sepals. The stigma and the ovary were entirely wanting. The accompanying diagram shows the position of the parts:

S
P at P
 at
 S

It must be classed as a case of regular peloria, attended with reduction both in the numbers of the parts in a whorl, and in a whorl itself. The pollinia

were well formed, so that a perfect male flower was the result. The pollen could be easily removed by an insect without the necessity for any special modification of the lip. If we accept the simplification of parts as an indication of "reversion," then, this flower represents an ancestral condition of greater simplicity. The opposite view, that it may be in some sense an advance, as implying a division of labour, may be held. The absence of the lip will put it out of court with the orchidist. *M. T. M.*

ODONTOGLOSSUM URO-SKINNERI.

In the choice collection of Orchids brought together within the last five years by D. B. Rappart, Esq., there exists one of the best coloured forms of *Odontoglossum Uro-Skinneri*. It is a plant which grows freely as a rule in skilful hands. The raceme of flowers is often 3 feet long. The sepals of this variety are ovate, and the petals roundly ovate, so that there is scarcely any intervening spaces between them; the ground colour is the greenish-yellow as seen in *O. excellens*, and the blotches are of a senna colour, irregular in size and position; the petals are heavily keeled at the back; the lip may be called brilliant for this species, the violet predominating, and the white standing out in relief over the whole of the oblate lip, which, together with the segments, form a circle. There were from twenty to forty eight flowers on each raceme. Why do not our Victorian medallists aspire to get this blood transfused? *J. Anderson.*

CYMBIDIUM LOWIANUM VIRIDE.

As this plant is of strong growth, producing roots freely, it should be given ample accommodation; the pots should have a liberal quantity of draining material, next to which should be placed a layer of sphagnum—this will prevent the soil blocking up the drainage; some good brown fibrous-peat, and double the quantity of light turfy-loam with some sharp silver-sand, will make a suitable compost. It is advisable to place the plant sufficiently below the rim of the pot so that it may receive a thorough soaking at the roots, as it requires much moisture during the growing season at the roots as well as overhead.

During the resting period, although the quantity of water given should be less, the plant should on no account be allowed to become dry, as this would materially injure it. An occasional sprinkling with the syringe when the weather is bright and warm will be advantageous, but during the dull months of winter it will be better to avoid this, and allow the plants to depend for moisture upon the water supplied to the roots occasionally; this will enable the spikes, which frequently begin to show as early as December, to come to full maturity. The temperature of the Cattleya house, and the atmosphere charged with moisture, will suit our plants admirably; when at rest, however, a temperature of 50° and less moisture will suffice. *Orchid Album*, vol. xi., part 132.

ONCIDIUM PHYMATOCILUM.

Sir Archibald Buchan Hamilton, of Smeaton-Hepburn, East Lothian, kindly sends us particulars of a raceme of *Oncidium phymatocilum*, recently flowered by him. The entire length of the inflorescence was 9 feet 7 inches, the longest side-branch was 2 feet 8 inches in length, the breadth between the extremities of two basal side-branches 5 feet. There were thirty-eight side-branches to the inflorescence.

CYPRIPEDIUM CURTISII.

One of the largest and most striking of its class, and occasionally a fine variety is flowered of which the fortunate possessor thinks very highly. A handsome and massive-looking variety is sent by W. H. Lumsden, Esq., Balmadie, Aberdeenshire (gr., Mr. Geo. Roberts), the chief peculiarity of which lies in the size of the labellum, which measures nearly five inches in circumference, and in the clear white of the ground colour of the petals, which are three quarters of an inch in width, and very regularly dotted with purple. *J. O'B.*

CIRRHOPELALUM COLLETTI.

A fine inflorescence is sent by D. B. Rappart, Esq., Promenade, Liscaud, Cheshire, of this handsome *Cirrhopetalum*, bearing four flowers of a yellowish ground colour marked conspicuously with purplish-crimson. The boat-shaped upper sepal has the apex prolonged and decorated with a purple plume. The smaller petals are also fringed at the tips, and the lower sepals lengthened out so as to form slender tails of about 4 inches in length; the lower part and the labellum are of a purplish-crimson colour. The species was introduced to this country from the Shan Mountains, where it grows at an altitude of 6,000 feet, and is therefore a species which requires but little artificial heat, unless it be in the growing season. *J. O'B.*

PEBISTERIA ASPERSA.

A plant of this comparatively recent introduction from Venezuela is flowering in the Royal Botanic Gardens, Edinburgh. The raceme carries flowers of a yellowish-brown, covered with brownish-red dots, and the lip is dark crimson upon the inner surface, but when lifted it presents a white blotch to view. Whilst growing the plant was afforded stove treatment, the compost about the roots being kept rather dry until the pots fill with roots. The plant is figured in *Lindenia*, t. 267.

DENDROBIUM MACCARTHEI.

Although this plant is rather difficult to grow, yet it is worth the trouble. The species is a native of Ceylon, requires a high temperature and moist surroundings, and even when growth is finished it should not be kept much cooler than when growing actively. The slender pseudo-bulbs are furnished with leaves mostly at the apex, whence also springs the short floral racemes of three or more blooms. These are about 3 inches in length, of a bluish-pink colour; the lip has a large dark blotch. A plant in the Edinburgh Botanic Garden has been in flower for several weeks past. *R. L. H.*

HOLLAND.

I saw in the spring some fine *Amaryllis* at the establishment of Messrs. De Graaff Bros., among them *A. Dr. Hogg*, deep red and pure white; and *A. Incomparable*, orange-scarlet and white. Among the prettiest *Anemones* were *appenina*, *blanda*, *fulgens*, *multipetala*, *Hepatica angulosa*, *memorosa*, *alba plena*, *bracteata plena*, *corulea*, *rosea* and *rosea plena*, *palmata*, *alba*, and *ranunculoides*. There is here also a fine collection of *Fritillarias*. Among *Hellebores* are the new varieties *Comète*, *Diadem*, *Dr. Moore*, *Duchess of Cleveland*, *John Bright*, and *Labyrinth*. I noted particularly interesting collections of *Lachenalia*, *terrestrial Orchids*, *Primula cortusoides*, and *Ranunculus alpestris*, *amplexicaulis*, and *millefoliatus*. There are numerous varieties of *Scilla*, *Sparaxis*, *Trillium*, *Adonis*, and some remarkable *Anigossanthus breviflorus*; *Anthericum aloides*, *graminifolium*, *Hookeri*, *Liliago*, *liliastrum* and *ramosum*; *Brodieas capitata*, *congesta*, and *coccinea*. I would also mention *Bulbocodium vernum*, *Camassias Cusicki*, *esculenta*, and *Fraseri*; *Caulophyllum thalictroides*, *Chelidonium japonicum* and *C. majus* fl. pl.; *Chionodoxa*, *Claytonia caroliniana* and *virginica*, *Cooperias Drummondii* and *pedunculata*, *Dielytra canadensis*, *Cucullaria eximia* and *spectabilis*; *Dodecatheons integrifolia*, *Jeffreyi*, *Meadia* var. *alba* and *elegans*.

Epimedium, *Erythronium*, *Freesia*, *Galanthus Elwesii*, *nivalis*, *Imperati*, and *plicatus*; *Heuchera sanguinea*, with its varieties *robusta* and *splendens*, deserve mention, as do also *Incarvillea*, *Ixiriolirion*, *Jeffersonia*, *Leucocorynum*, *Leucojum*, *Macrotonia*, *Marica*, and *Massonia*. Among many species of *Ornithogalum*, the best were *pyramidale*, *pyrenaicum*, *umbellatum*, *arabicum*, *Bergi*, and *lacteum*.

The *Oxalis* are all pretty; *Puschkinia libanotica* and *scilloides* are really gems. *Sanguinaria canadensis* makes an excellent rock-plant; *Saxifraga granulata* and *peltata* are known favourites; and *Soldanella alpina* and the white variety do well in shady parts.

Among the best *Ranunculaceae* I noted *Thalictrum aquilegifolium*, *flexuosum*, *japonicum*, *lucidum*, and *rubellum*.

The following flowers were charming: *Triteleia*, with sweet scented blossoms; *Uvularia* and *Zephyranthes atamasco*, from North America, bearing white flowers flushed with rose.

At Haarlem, among fields of *Hyacinths* and *Tulips*, is the establishment of Messrs. E. H. Krelage & Son. Here (at the end of April) *Hyacinths* were still in flower. I saw the following excellent and little-known varieties of *Hyacinths* cut, and destined for the Berlin Exhibition:—*Grandiose*, double white double *Tolstoi*, delicate rose; *Kestanjebloem*, also noticeable. There were still fine spikes left of the dark *Jacques* and porcelain-blue *Holbein* and *Johan*, good varieties for forcing. *Trilby* bears an orange flower, *Gounod* is blue; *Lemon-tree*, a compact and yellow raceme; *Hofdyk* is also yellow, as are New *Canary-bird* and *Gold-light*.

Narcissus of all species were blooming abundantly. Among the newest and best, I admired a new double form, *N. incomparabilis semipartibus plenus*, raised by M. Krelage, like a double *Poet's Narcissus*, but pale yellow.

There were some varieties of *Anemone fulgens* with large flowers, such as *Aldboroensis*, *Glory of the South*, and *Annulata*. The variety *Multipetala* is a decided advance upon the ordinary double flowers. The firm is very successful in hybrid *Fritillarias*.

Chinese *Paeonies* are very fine here; there are about 500 varieties in wide borders which promise to be very gay.

In the houses are many fine *Amaryllids*, some now out of bloom. There is a good collection of dark-flowered seedlings bearing five or six blooms on each raceme. *Cliveas* were handsome but nearly over.

Asparagus Sprengeri and *comoriensis* are largely grown at the Bloemhof Nurseries, as well as a climbing Fern, *Lygodium japonicum*. *Ch. D. B.*

NITRATE OF SODA v. SULPHATE OF AMMONIA.

THE importance of some nitrogenous artificial manure is now fully recognised among farmers, gardeners, and fruit growers—the main question to be considered is, what shall it be? This, to a very large extent, must be decided by the current price of the different materials in the market, and also upon the character of the soil to which the manure is to be applied. The subject has recently been dealt with and discussed by Mr. F. J. R. Carulla, F.C.S., in a short pamphlet, in which he advocates the use of sulphate of ammonia as equal in value to, if not superior to, nitrate of soda. It is now found that sulphate of ammonia can be obtained as a by-product from blast furnaces, which will probably cause this manure to become cheaper than formerly, and the manufacturers are naturally anxious to find a ready market for their commodity.

The commercial value of nitrate soda and of sulphate ammonia is based entirely upon the amount of nitrogen they contain, notwithstanding the fact that the action of the two ingredients when added to the soil are entirely different.

Both substances supply the growing crop with nitric acid, but while the ammonia of sulphate ammonia has to be converted into nitric nitrogen before the plants can use it, the nitrogen of the nitrate soda is available to plants at once. This may or may not be an advantage, and will depend largely upon the class of soil to which the different manures may be applied.

Weight for weight, sulphate of ammonia is cheaper than nitrate of soda; in fact, about 4 cwt. of the former are equal to 5 cwt. of the latter; the ammonia containing about 20 per cent. of nitrogen, while the nitrate contains but 15 per cent.

We have already mentioned that the benefit derived from the two manures will depend upon the character of the soil, and upon the description of crop to which they may be applied. In the agricultural experiments at Rothamsted, where the soil is of a somewhat

heavy loam, nitrate of soda generally gives the best results, although, owing to the liability to excessive drainage in the winter, this manure has always to be applied in the spring; while in the agricultural experiments at Woburn, where the soil is of a light sandy character, sulphate of ammonia usually gives the largest returns. *J. J. Willis, Harpenden.*

AMERICAN NOTES.

THE LOGAN-BERRY.

ONE of the most interesting of recent contributions from American experiment-stations is Professor L. F. Kinney's bulletin on the Logan-berry. This fruit has been widely advertised, and much talked of in recent years; but most of the experience reported by growers has been rather negative than positive. In California, whence the fruit came, it seemed to have achieved some success. Mr. E. J. Wickson reported from the Californian experiment-station in 1894, that it had "proved to be a robust grower, with large, handsome fruit, possessing a striking flavour, suggestive of a combination of that of Raspberries and Blackberries." In 1895, *Mechanics' Monthly* noted the ripening of a few berries at Philadelphia, and remarked that the canes would require winter protection. Professor Kinney concludes that the Logan-berry is the most promising new type of small fruit that has been grown at his station, but thinks also that it will require winter protection. The plants are propagated by stolons or cuttings. Seedlings can be grown, but are comparatively worthless. The Logan-berry is supposed to be a Raspberry-Blackberry hybrid.

PIMELEAS.

PIMELEAS are natives of New Holland, and the species commonly cultivated in our greenhouses are *P. ferruginea*, better known in gardens under the name *decussata*; *P. rosea* syn. *Hendersoni*, *P. spectabilis*, *P. Preissii* syn. *Neyperglana*, and *P. ligustrina hypericina* syn. *elegans*. The most suitable kind of soil for Pimeleas consists of two parts good fibry peat and one part turfy loam, and coarse silver sand in quantity sufficient to keep the whole porous and sweet; small broken charcoal is also a useful ingredient. The peat and the loam should be pulled to pieces, but need not be sifted, except for very young plants, and the whole should be well mixed together before use.

Drainage is an important point, and needs to be efficiently done by using three sizes of clean crocks, the largest to cover the bottom of the pots, which should be quite clean; the next size to be placed very carefully on this one, the smallest of all on the top of these; put some of the rougher bits of soil over these, the pots are then ready for the plants. The present is a good time to procure plants from the nursery, and as soon as received they should be shifted, so as to get them established before winter. Large specimen plants had better be repotted at the beginning of the month of March, as late summer potting, unless the plants are very carefully afforded water, is likely to induce growth that cannot be ripened that year. These large plants should have the soil loosened at the sides, and the roots set free; or the outside of the ball, if much pot-bound or matted, may be shaved off with a knife with advantage to the plants, and in that case there need be no increase in the size of the pots. Whichever method be followed, the surface of the ball should not be more than half an inch lower than before, ample space being left—say, 2 inches—for holding water. The soil should be put in round the old ball in small quantities at a time, making it firm with the fingers, and ramming it with a potting-stick before putting in more of it. A shift for a large plant should be not less than 3 inches larger in inner diameter than before. Young and vigorous Pimeleas may have a 2-inch shift, which usually will suffice for twelve months. Afford the repotted plants a copious appli-

cation of water, place them near the roof of the greenhouse, affording after a week abundance of air at all times; and when the new roots begin to permeate the soil, place them in a cold frame, affording full exposure in fine weather, but not allowing heavy rains to reach them; but put the lights over them, admitting, however, as much air as possible to the frame. Rain-water is best for these plants, and if manure be used in the season of growth, it should be of a very mild description, water just stained with guano and soot being good for them from May to August. In hot weather, afford the plants a syringing in the evening, and damp the ash-bed on which the plants stand in the frame, and the ground beneath the greenhouse stage. In the winter, just as much water is needed at the root as will prevent flagging. The temperature of an ordinary greenhouse suffices. The shoots made in spring and early summer may be pinched once before the end of June if the plants have reached their full size, and twice or thrice if they are young. Young plants may have the flowers removed with a small piece of the shoot in April, and be started into growth sooner than is possible with flowering plants of half-specimen or specimen sizes. With a few neat sticks, it is possible to regulate the head, and give symmetry, the first three species named being of naturally compact habit. *Pimeleas ligustrina hypericina* and *P. Preissii* make more slender and less compact growth than these, and which more than one stopping in the season in the case of old plants would tend to spoil, although several stoppings of the leading shoots would be permissible in the case of young plants. It is very necessary to keep the soil free from moss, to stir the surface frequently, and to top-dress the old ball in the autumn, and also in the spring in the cases of plants that are not going to be re-potted at that time. *H. T. M., Stoneleigh.*

THE ROSARY.

JULY IN THE ROSE GARDEN.

NOTWITHSTANDING the backward condition of our Roses about the middle of June, the grand weather at the end of that month brought them on very rapidly. We know what a vast difference a few days of real summer weather has upon all flowers, but I have seldom noticed the Rose come along so rapidly as during the present season.

Mulchings will have a great effect upon late-summer and autumnal bloom if applied at once, taking care to hoe the soil deeply before applying it, for unless one can maintain the land in a moist condition by mulching, artificial waterings do but little good. To afford light applications of water is almost useless; indeed, I believe they do more harm than good, as they serve only to excite the roots near the surface, and then leave them to be parched after the moisture has evaporated. Not only does a mulch prevent this, but it supplies plant-food as well at the time when it is of most benefit to the plant.

Early-flowering Climbers upon walls, the main crop of blossoms on these will soon be over, and it will be well to use the knife freely and cut away the bulk of the wood that has flowered, thus allowing space for new shoots to be laid in, and preventing much of the fresh growth from forming upon shoots that would be cut away next season when pruning. At the same time, a few thorough applications of liquid-manure will be a great help to all wall Roses. We do not sufficiently bear in mind the fact that the soil of a border near the wall is liable to become very dry, and as we cannot have good Roses next year without a supply of flowering-wood made this year, it is well to afford encouragement to the plants at the right time. A free use of the garden-engine or powerful syringe, with water only, has a good effect in clearing the plants of insects, and is of help to the former in hot weather.

Budding.—One of the most important items in Rose-culture during July is budding, and unless the Briars intended for standards are budded early the bark seldom lifts well. Nor is it possible to bud all

suitable shoots at any one date, some few of them being far more advanced than others. It is not a good plan to cut away any of the Briar growth just previous to inserting a bud, as the bleeding, which ensues from a wound, sometimes causes the bark to cling, and even when this is not so, before the bud can be inserted, the partial check to the flow of sap cannot be beneficial to the inserted buds. The operation itself has been so often described that I will only warn my readers against too tight a tie when securing the bud; still, a bud must be tied in with sufficient firmness if a proper union is to take place. *A. P.*

THE EXCLUSION OF FOG FROM HOTHOUSES.

DR. SCHUNCK, President of the Society of Chemical Industry, addressing the annual meeting of the society at Owens College, Manchester, on Wednesday last, referred to the manner in which the atmosphere of large towns was poisoned by smoke, and to its ill effect upon the population. The great distress caused to those suffering from pulmonary complaints by the fogs so often prevailing in these towns had, he said, no doubt more than once suggested the possibility of filtering the air before allowing it to enter into our dwellings. The difficulties of such a device did not seem great in themselves, the real difficulty arising from the habits and prejudices of the people, who could not understand the possibility of ventilation, except it be through windows and doors. In his paper on "The Effects of Urban Fog upon Cultivated Plants," Prof. T. Oliver mentioned with favour a plan devised by Mr. Toope, an engineer of Stepney, who caused the air entering his hothouses to pass through boxes containing trays with sticks of charcoal, before impinging on the hot-water pipes, an out-draught being secured by means of "exhaust caps" placed on or near the ridge of the house. The plan, in Professor Oliver's opinion, was an efficient one. That any such plan would succeed in private houses, as at present constructed, was very doubtful.

Dr. Schunck ventured to suggest, though he did it under fear of censure, that a moderate amount of smoke might actually be beneficial to vegetation by covering the leaves and other parts of plants with a thin coating of carbonaceous or tarry matter, and thus rendering them unpalatable to insects. Of course, the amount would have to be exceedingly small, for if excessive they would soon experience deleterious effects, such as were seen in the scanty and blighted vegetation in the immediate neighbourhood of smoky towns.

CULTURAL MEMORANDA.

CODIÆUMS SYN. CROTONS.

WHERE these ornamental stove shrubs are required in large numbers, the following method of culture, which is largely practised on the Continent, is well worthy of a trial:—In March the tops are mossed round, and roots thus induced to form, then these are removed, and potted in soil, and early in May, when well rooted, they are planted out at about 15 inches apart in beds made up in low span-roofed houses. These beds, about 12 in. in depth, consist of loam, sand, and a small quantity of peat. The house is shaded for a few weeks, that is, till the plants have become established, and from that time onwards they are fully exposed to the sun, and a close, moist atmosphere is maintained throughout the summer months. By the end of the month of August the plants have grown into straight-stemmed, well-coloured specimens, from 2 to 4 feet high, and they are then dug up and potted, mostly in 32-sized pots, though the size of the plant determines that of the pot most suitable for it. A little extra attention paid to shading, syringing, and affording water at this period is well repaid by the plants retaining their leaves right down to the pot. After a time, a cooler temperature is an advantage, as it enables the plants to harden before they are required for decorative purposes. This method of culture saves a good deal of labour in watering, potting, &c., and fine, healthy plants are obtained. *H. T.*

THE DENDROBIUM ORCHID-BEETLE.

Diaxenes Dendrobii (Gahan).

In December of 1896, I was asked to visit the Orchid-house of a larger grower in Midlothian, where the Orchids were being ruined by some agency or other. On examination of the unhealthy plants, I found many of the pseudobulbs tunnelled by larvae of a longicorn beetle. Later on, at the Royal Botanic Garden I bred out the beetles from these larvae, and the pest proved to be as suspected, *Diaxenes dendrobii*, G.

FIG. 11.—ADULT BEETLE ON DENDROBIUM CARINIFERUM. (Enlarged.)

With the beetles thus won, I proceeded to work out the life-history of the pest in one of the glass-houses at the Botanic garden with Orchids provided for the purpose.

When my experiments and observations are completed, which will not be for some months yet, I will publish a full account of the *Diaxenes* and its work, but meanwhile, I think it may be helpful if I issue this preliminary note, warning those interested in Orchid cultivation to be on their guard. I am induced to do this at the present time, as I have, in the course of my experiments, just proved that the beetles will and do breed in our Orchid-houses, a fact which up till now, has been doubted, and indeed, declared improbable. *Diaxenes dendrobii* is a pretty brownish-grey beetle, from one half to five-eighths of an inch long, with long antennae, and with whitish or yellowish lines along its upper surface (fig. 11). The grub (fig. 12), which lies inside the pseudo-bulb, is whitish and legless (but still very active), with scaly brown head and biting jaws. When full fed it makes a cocoon out of the fibres of the hollowed-out pseudo-bulb (fig. 13), from which cocoon, after pupation, the beetle emerges.

Diaxenes is injurious, both as imago and as larva. The grubs mine into and

tunnel out the pseudo-bulbs till, it may be, merely the outer skin is left, while the beetles feed on pseudo-bulb and leaf and root (fig. 14).

Undoubtedly the pest has been introduced in Orchids imported from Burmah. In March of this year I examined in the Botanic Garden some *Dendrobium nobile* Orchids freshly imported from Burmah, bought at a sale in London; and in some of these plants I found larvae which now, as I write, have reached the beetle stage. Doubtless a number of similar plants will have been distributed over the country, and with them the pests, for which a careful outlook should be kept. The beetles should be killed whenever found, but very careful looking is required to find them. Feeding chiefly by night and resting by day (often at the base of the plant), they escape notice; and as, in addition, they are protectively coloured, until the eye gets accustomed to them great difficulty is experienced in picking them out. That the beetle is present, however, may be known by its work, for which see the figures.

The pseudo-bulbs which harbour the larvae can be detected by the withered appearance, and to begin with, by the blackish or brownish discoloration of one side, this discoloration marking the progress of the

FIG. 12.—

2. Full-grown larva, somewhat enlarged.
3. Pupa removed from cocoon, dorsal surface; twice nat. size.
4. Pupa, ventral surface; twice nat. size.

enclosed grub. By squeezing the pseudo-bulbs too between the fingers the attacked ones give a little, lacking the firmness of those of healthy plants. The enclosed grub should be cut out and destroyed. From what I have seen, I have no hesitation in describing *Diaxenes dendrobii* as the very worst of Orchid pests, and should it once get a footing in an Orchid-house, there is much discouragement and disappointment in store for the owner or cultivator.

Diaxenes dendrobii takes its name from its infesting the genus *Dendrobium*, but I am sorry I have to add, that the beetle seems willingly to feed upon

FIG. 14.—PSEUDO-BULB OF LÆLIA ANCEPS GNAWED BY ADULT BEETLE. (Natural size.)

almost any Orchid with marked pseudo-bulbs. In my experiments, *Dendrobium*, *Cochleya* (fig. 13), *Cattleya*, and *Lælia* (fig. 14), have all been attacked, and at present I have a brood of my own rearing in *Lælia anceps*. As I am desirous not only to get a complete knowledge of the spread of *Diaxenes* in Britain, but also to make my report when issued as helpful as possible, I will be much obliged if anybody who has had experience of the beetle or its work will communicate with me here. I need hardly add, that any information thus received which might

FIG. 13.—COOCON IN SITU, SHOWING EXIT-HOLE OF BEETLE IN PSEUDO-BULB OF DENDROBIUM. (Rather less than nat. size.)

prove helpful, will be fully acknowledged. *R. Stewart MacDougall, M.A., B.Sc., Royal Botanic Garden, Edinburgh.* [We add an illustration of a similar beetle, *Diaxenes Taylori* (fig. 16), found on *Saccolabium*. *Gard. Chron.*, June 11, 1887. Ed.]

FRENCH CHERRIES.

CHERRY-TREES are grown everywhere in France, although in the south their cultivation is limited by the intense warmth. The fruit does not require a particular kind of soil, though one that is deep, dry, calcareous, and silicious, is preferable to an argillaceous, compact, and humid soil. In the opinion of French growers, the best site for a Cherry-orchard is a hill or open field, where air and light are readily accessible. If grown near to a wood or forest, the fruit is likely to ripen too quickly, and be devoured and injured by birds. A cold soil and foggy atmosphere greatly impedes the development of the plant, and there will be little blossom; too much heat is also detrimental. When the trees are grown as espaliers, the tops should be allowed to incline towards the north, and in this way the maturing of the fruit will be retarded. Sometimes trees are grown by the seaside, but it is not desirable. The mode of increase is by seed, and

the French grower chooses for seed those fruits which grow on the most flourishing trees. He waits till the fruit is entirely ripe, and then takes a few Cherries at hazard, cracks the kernel to ascertain if the seed be in a healthy condition, and that it is sufficiently matured to germinate. The seed is sown as soon as possible after being gathered, otherwise the kernel is apt to become rancid or musty, when no germination is possible. If, how-

Cherries are large'y consumed in France. The Bigarreaux are not so digestible as some others, and they should therefore be eaten in moderation. The Guignes, or white heart Cherry, and the Griottes are dried for consumption during the winter, and are stored like Apples on shelves. The last two species are those in demand for making jam, and for preserving in brandy. The French have many ways of cooking Cherries; and a very good kind of oil

Among some of the choice varieties of Cherries grown in the suburbs of Paris are l'Anglaise and La Royale d'Angleterre [Anglaise Tardive is late Duke; and Anglaise Hative, May Duke. Ed.]; both kinds are early and of the finest quality. By the end of May both varieties are ripe for gathering; in colour, they are of a deep red, and though acid, are very palatable in flavour. The Anglaise variety is that most in demand for exportation, and enjoys great popularity as an eating or preserving fruit. The Montmorency [Yellow Ramonde. Ed.] is another fine variety, and it is so much thought of that the French call it "*la reine des cerises*" (the queen of Cherries) [although Hogg in his *Manual* says that it is fit only for preserving. Ed.]. The fruit is of a medium size, bright red in colour at first, and becoming darker as it becomes quite ripe, bristly acid, and flesh tender. July is the month *par excellence* when Montmorency Cherries are ripe. There are two varieties of Montmorency, one long and the other short stalked; both are hardy, and the blossoms able to withstand sharp frosts, which may serve to explain their extensive cultivation. There are no fewer than twenty different varieties of Cherries in France; the latter number are again subdivided into others, of which nine are suitable for orchards, and nine others for gardens. The Bigarreau is largely grown in France also; of this kind there are two varieties, and both are good; the first is half-red and half-yellow in colour; the

FIG. 15.—*OEOLGYNE CRISTATA* SHOWING LEAVES CHARACTERISTICALLY INJURED BY MATURE BEETLE.

(Natural size.) From a drawing by Mr. A. Hogg. (See p. 48.)

FIG. 16.—*DIAPARSES TAYLORI*
(See p. 48.)

second category is black and red, the latter is very productive, and chiefly raised upon a light dry soil; the red and black Bigarreaux are subject to attacks from a worm known as l'Ortalide.

Lower Burgundy devotes considerable attention to Cherry culture, the Cherry orchards being mostly situated on hills. The fruit is usually sold on the spot, at so much per 100 kilos., the buyers being brokers who establish themselves temporarily in the villages in the districts in which the Cherry orchards abound, buying up the Cherries wholesale, and having the advantage of being on the spot to superintend the packing of the fruit. The fruit is packed in baskets of rectangular shape, 60 centimetres long. The brokers accompany each cargo to the nearest railway station, from whence the fruit is sent off by special fast train direct to Paris, and thence to London, Berlin, St. Petersburg, and other important capitals. The department of the Yonne is the true cradle of the French Cherry-growing industry. Long before railways were constructed in that part of France the trade was flourishing, especially that of the Anglaise variety, which was then, as now, in much repute. The Cherry baskets at that day were carried on the backs of donkeys, the animals bringing the fruit to the nearest village, where it was exchanged for poultry, milk, and other commodities.

ever, through some unavoidable cause or other, the seed cannot be sown at once, the kernels should be carefully stratified—that is, covered in alternate layers of kernels and sand. The ground to be sown should have been carefully prepared, and the kernels should be sown either broadcast by hand, or in furrows. The seeds germinate by the end of the spring, and the shoot is let alone for one, two, or three years, according to the purpose for which the trees are intended.

is extracted from the kernels, which is largely employed by pastrycooks in flavoured cakes and sweets. The gum or resin exuded by a Cherry-tree is much in favour in the medical world [?]. When this resin is mixed with water, it spreads, but does not dissolve, and it is sometimes employed as a substitute for paste. The wood itself, which is tenacious, is much in request for cabinet work and for the manufacture of tobacco-pipes, these being the only two industries which employ the wood of the Cherry.

Forty-five years ago it was not unusual in France to exchange one pound of Cherries for one dozen of eggs or half a pound of butter; four pounds of the fruit would purchase a fowl; any grower that brought 100 lb. of Cherries to the market received in exchange 20 lb. of butter, 100 eggs, and half a dozen of fowls!

Of course, when railways were made, quite a different order of things took place, which resulted in an increase of the Cherry trade. At St. Bris, it is a pleasing sight to witness in the month of June as early as 3 o'clock in the morning, all the inhabitants of the surrounding villages starting in a body en route for the fruit plantations. At each corner of the streets stand merchants, whose sole business consists in weighing the fruit and purchasing it. No credit is ever given. "Cash with order" is always the rule. St. Bris, which is a very large and important Cherry-growing village, has a special exchange or hall, where buyers repair each day, and ascertain the latest market quotations, after which they transact business accordingly. At 12 o'clock noon the picking of the fruit ceases; the afternoon is devoted to conveying the baskets full of Cherries to the nearest railway station. When the harvest has been a good one, sixteen railway trucks represent one single morning's picking. During one year the railway stations of St. Bris and Auxerre transported over 1,000,000 lb. of Cherries between them. For miles and miles only Cherry trees are to be seen; they are planted between Vines, and prosper exceedingly. The picking of the fruit, as a rule, is generally the work of women and children; no outlay is required, save cost of culture, hence the proprietors reap a good profit. In good years St. Bris and district sell as many as 100,000 francs-worth of Cherries. The most important Paris suburb where Cherries are grown is Villiers Saint-Frederick, in the department of Seine-et-Oise; it is but a small village, having but 300 people, and is built upon a dry sandy soil. The inhabitants give themselves up wholly to cultivating the Cherry, and boast of being able to send several thousands of francs worth of Cherries to Paris every year. *Edward Conner.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

Vanda teres.—Very soon after this species has flowered, it commences to make fresh roots. If the plants are taller than is desirable, cut the stems off at about 2 or 3 feet from the top, then fasten the severed pieces to long, upright teak rafts, containing three or four rods, each rod about 1 inch apart, to allow air to pass freely between the roots. Half-a-dozen or more stems may be fixed to each raft, and the lower part should then be inserted in a pot, and made secure with crooks, which may fill the pots to within an inch of the rim. The base of the stems should rest upon the drainage, over which place a thick layer of living sphagnum-moss. If large quantities of this *Vanda* is desired for cutting from, and house space is limited, a bed of sphagnum-moss should be made upon the stage, and the tops or cuttings thickly inserted into the moss, and supported in an upright position with stout sticks. Rough, unplanned teak rods, about half an inch in diameter, are preferable to the ordinary stakes. The old portion of the stems if allowed to remain upon the rafts will make fresh shoots, and by next season may make nice flowering plants. During the growing season the species should receive plenty of direct sunshine and copious overhead syringings several times each day. The sunny side of the Mexican house is the best place for it, but a similar position in a plant stove will do. Until the young roots have taken a firm hold of the new wood the plants should be kept rather close, and thinly shaded from hot sun. Close the house early in the afternoon when the sun is shining full upon the plants, at the same time give the stems a good syringing with water. The new hybrid *Vanda*, Miss Joaquim, figured in *Gardeners' Chronicle* a few weeks ago, requires similar treatment. Plants of *V. Hookeriana* are now showing their flower-spikes, and require much sunlight and copious overhead syringing daily until the flowers expand. This species requires the hottest temperature available throughout the year.

Cattleya-house.—*C. Rex*, *C. Dowiana* and its variety *aurea*, will be showing their flower-sheaths, and if moisture be allowed to get into the growths the flower-buds may decay. Closely examine the plants every day, and there may be seen a dark brown sheath encircling the base of the current season's growth. If this sheath be found the least damp, it should be split open to allow the moisture to evaporate. Failing this the new bulb will turn black, and must be cut off immediately, or the remaining part of the plant may become similarly affected. After the sheath has been opened, keep the plant rather dry at the root for a few days; this will assist the moisture to evaporate, and tend to save the life of the plant. Plants of *C. gigas* now in bloom, or that have just passed that stage, should be kept rather dry for a week or two, which will be conducive to the formation of numerous roots. Repot plants of *C. gigas* immediately they commence to make new roots from the base of the newly-made growths. When potting, afford ample drainage, and use the best fibrous peat and sphagnum-moss in equal parts, with a few pieces of crocks intermixed. Elevate the plants a trifle above the rim of the pot, and use a few sticks to hold them firmly in position. Place the plants on the side-stage of the house, with the leaves close to the glass. Water the plants with care after repotting, sufficient to encourage the new roots to enter and establish themselves in the new compost is alone necessary. The plants when well rooted require a cool or intermediate temperature, and plenty of light and fresh air while at rest.

Cool-house.—*Epidendrum vitellinum* is commencing growth, and should be afforded fresh compost without delay. This useful species may be grown in an ordinary flower-pot, or in shallow suspending pans, using a mixture of peat and sphagnum-moss for them to root into. Keep the bases of the young growths well above the compost, and they will be less liable to turn black. The thin-bulbed *Laelia harpophylla* should be repotted, and placed in the cool-house until growth recommences.

THE FLOWER GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Pyrethrum roseum.—The double and single-flowered varieties of this plant are much valued for garden and house decoration in the early summer, and any increase of the stock of plants, or division of those which have become too large, or which do not now throw fine flowers, may be undertaken. On taking up a clump, throw aside the weak shoots from the centre, unless the variety be scarce, or the stock in general not plentiful. The other pieces may have the points of the longest leaves removed, but much of the roots should be reserved, and potted into 48's, using a sandy sort of loam. Stand these in a frame, and keep rather close and shaded till growth recommences, when shading should be gradually discontinued, and full exposure afforded. If a frame be not available, stand the pots on the north side of a wall, and damp the plants over occasionally. When potted in this manner the plants soon gain strength, and they are ready for putting out early in September. Half-a-dozen of good double-flowered varieties are *Mont Blanc*, white; *Hermann Stenger*, crimson; *Lady Blanche*, flesh colour; *Nemesia*, orange-red; *La Vestale*, pink; and *King Oscar*, crimson-scarlet. There are numerous named single-flowered varieties; but as a good variety of colours may be raised from a packet of seed of some good strain, only enthusiasts buy those. Seeds may be sown at this date, the young plants being wintered in frames, and planted out in the spring.

Narcissus poeticus, and other varieties, should be lifted where required, if not already done, the bulbs assorted and re-planted early. Where home-grown bulbs of *N. ornatus* are used for forcing, they should be lifted and potted this month, as the bulbs form new roots early if left in the ground, especially after heavy rains following a period of dry weather, which is the case with various *Daffodils*. The double-white *Gardenia*-flowered *Narcissus* produced more perfect flowers this season than I have known them for some years past, which I attribute to the moist winter and spring experienced this year, and the *Narcissus* bulbs being in good condition generally.

General Work.—The great heat and drying winds have proved trying for many of the occupants of the flower-beds and borders, and herbaceous perennial subjects are being forced into bloom prematurely. The shrubby *Phloxes* soon betray the effects of heat and drought if not well mulched and afforded water,

losing their lower leaves, which makes them appear unsightly. If *Dahlia* blooms are required for exhibition, three stakes should be placed in a triangle around each plant, inserting them about 15 inches apart at the base, but spreading outwards towards the top, and three main shoots should be tied to them, the others being removed, and laterals from these kept pinched out. For ordinary garden decoration where flowers in quantity are required, much disbudding is not necessary, especially if the plants have been grown on from spring-struck cuttings. Where old roots are planted, a little early thinning of shoots is advisable, afterwards allowing the laterals to extend, and thus ensure a good head of bloom for effect. If the ground beneath the *Dahlia* is not already mulched, this should forthwith be done. *Pansy* and *Viola* seeds may be sown in shallow drills drawn on a somewhat shaded border, the soil being broken down finely, and the drills watered with a fine rose-can a short time before sowing the seeds. If sown now, plants will be ready for planting in the beds in late autumn. The shoots of *Verbenas*, *Ivy-leaf Pelargoniums*, and such-like trailing plants, should be kept pegged-down until the ground is covered, removing all dead leaves and flowers, especially those of the summer-flowering *Violas*, on which plants form freely, quickly exhausting the plants if left.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Leicestershire.

Grape Vines.—The Vines from which the fruit is removed should be afforded occasional syringings, and copious applications of water to the borders. The lateral shoots should be removed, so that the future fruit-buds may obtain all the light and air possible. Vines with ripe Grapes should have a genial, buoyant atmosphere, but one that is not very dry, or shrivelling of the Grapes will occur. Damping down should take place early in the afternoon, so that the moisture may in great part evaporate before nightfall. If black Grapes have to be kept in good condition for a long time, the Vines should be shaded in bright weather. Later Grapes will require a good deal of attention at this date, carefully examining them at short intervals to ascertain where the bunches need a little thinning, but taking care not to destroy the compactness of the bunches. Afford tepid liquid-manure to the borders before these become dry, thereby keeping the berries increasing in size as long as possible. Remove all but the largest and strongest shoots, taking a few at a time, so as to avoid checking growth. Any variety that is liable to split, namely *Madresfield Court* and *Black Morocco*, should have a little less humidity in theinery—not easy of accomplishment when these Vines are mixed with others. In that case the best method to follow is to let the laterals run a bit wild just as the fruit commences to colour, and not to damp the ground underneath the Vines in the afternoon, and not at all if the day be dull and sunless; and if these measures have no effect, bore a small hole or cut a notch in the shoot just behind every bunch. I think one of the chief causes of splitting is that the borders are kept too dry in the earlier stages of growth, thus causing a check to growth; then affording water freely, causes a sudden accession of sap, which the skin of the berry is unable to accommodate. Afford free ventilation on hot days by opening the back and front lights, especially in old-fashioned houses, where, probably, the foliage is close up to the glass, as it is in such houses that the foliage is apt to get scalded. Follow up the syringing between the bunches with clean, soft water, whenever practicable, this being of great assistance to Vines in hot weather; and leave a trifling amount of ventilation by the upper lights after the Grapes begin to colour.

THE KITCHEN GARDEN.

By W. POPP, Gardener, Highclere Castle, Newbury.

Cauliflowers.—If there is a likelihood of a break in the supply by reason of the bulk of the crop turning in altogether, some of these least forward may be pulled up and stored in a cool shed in moist soil, where the head will remain fit for use for a week or ten days afterwards. Keep a sharp out-look for caterpillars; and to prevent the heads from turning greenish, break a leaf or two over them as soon as they begin to form, or tie up the leaves with matting, which may take longer in doing, but it is the most effective method of excluding sunshine.

Cabbages for Early Spring Use.—A sowing may now be made of *Ellam's Early*, *Sutton's Flower of*

Spring, or the true Wheeler's Imperial, another sowing being made in about ten days later. It depends on the nature of the season which sowing will be of most use. In southern counties the Cabbage from the earlier sowing are often "proud," that is, they grow too large, and turn in during late autumn and early winter; whilst, if September and October should be wet and sunless, the early-sown plants produce the best Cabbages in the spring. Choose an open situation for the seed-bed, and a moderately rich soil, sowing the seeds thinly in drills drawn 8 or 9 inches apart. Protect the seeds from the depredations of the birds by using fish-nets, or by rolling the seed in powdered red lead. Plant a good breadth of Colewort as soon as the plants are ready, these being the most useful of vegetables. They do not want much space in which to grow, 1 foot each way being ample. If the weather and the soil are dry at planting time, the plants should be put out in drills that have been well moistened a couple of hours before, and be again afforded water after the planting is done. When the ground is hoed, the drills will be all up.

Parsley.—A good sowing of Parsley may now be made, and the thinnings when large enough to handle may be pricked out into beds. If the rows are so placed that frames can be placed over them, Parsley leaves may be gathered in good condition in any weather in the winter and early spring.

Endive, Lettuce, &c.—A good breadth of Endive may now be sown, the round or broad-leaved Batavian being a useful variety for sowing at this season. The seeds may be sown in rows 15 to 18 inches apart, and thinned when large enough to 10 inches in the rows; and the thinnings if planted on a sheltered border will form a good succession, or seed may be sown broadcast in a bed and the seedlings transplanted. A small sowing of summer Lettuce should be made at this date for coming in late in the autumn, Hick's Hardy White being a good variety for sowing at this date.

Watering, Mulching, &c.—Celery, French and Runner Beans, and Peas, will all require abundance of water at the roots; but if only dribblers can be supplied the work is better left alone. If water is scarce, it is better to afford it thoroughly to one or two rows of any given crop than to waste it by dribbling over a lot of land. Mulchings of rotten manure, or short litter, should follow the application of water.

PLANTS UNDER GLASS.

By G. H. MARCOCK, Gardener, Luton Hoo Park, Luton.

Schizanthus retusus and pinnatus.—A sowing of seeds of these plants may now be made, for spring and summer flowering. These varieties of Schizanthus do very well in ordinary soil out-of-doors if sown during the months of March and April; but for growing in pots, the soil should be made somewhat rich. The better method, and one that avoids pricking-out, is to sow a few seeds in a number of 3-inch pots, thinning the seedlings to one in a pot, and shifting them into 8-inch pots when getting well rooted. A few of the plants should be retained in the smaller pots, for employment in rooms, in jardinières, &c. The plants raised now should be kept in cold frames and near the glass, which is easily done with movable staging, or boards supported on something; and at the approach of winter remove them to a greenhouse shelf, where they can get plenty of light.

Humea elegans.—Serviceable plants of Humea may be obtained next year by sowing seeds at the present date. These graceful plants are well worth all the care that can be bestowed upon them, being equally pleasing objects in the conservatory or the dwelling as in the flower-garden. The soil used in the seed-pans should consist of leaf-mould and a small quantity of loam, with sharp sand added. First afford the seed-pans water, then when the surface is firm sow the seeds and cover slightly, and lightly sprinkle the surface with water. Humeas dislike heavy watering, and water must therefore be sparingly applied. When the seedlings are large enough to be handled, at once prick them off singly into 3-inch pots, retaining every root possible, and keep the plants in a cold frame till October, then remove them to a greenhouse, avoiding drip, and a close air, and not wetting them overhead.

Linum catharticum.—At this season abundance of seed is obtained, and these plants, and, providing the seed is not overdone, one can scarcely overdo root-feeding. At this time till well into the month of August the quantity should be reduced.

Winter-flowering Plants in Cold Frames.—During warm weather, it is difficult to keep red-spider and thrips in check; much, however, may be done by a free use of the syringe, and by dipping those plants that are in pots in a tub containing a safe kind of insecticide. Let all stopping and tying-out receive attention betimes, not allowing the plants first to get into bad order.

Pentas carnea is a plant that requires frequent stopping at this season, or great lankiness of growth ensues, and the foliage should be well syringed with rain-water. Well-rooted plants should be afforded liquid-manure occasionally, and be plunged in a bed of tree-leaves in a cold pit, giving air carefully, so as to avoid draughts of cold, until the plants have got accustomed to their quarters.

Libonia floribunda and **Reinwardtia tigrina** should be dipped occasionally in an insecticide to free them from red-spider, syringing alone being not entirely sufficient to do this. Any neglect of this remedy will render the plants useless for decorative purposes.

Abutilons growing in pots, if robust, should have the points of the main shoots nipped out, and plenty of water afforded them, fumigation being done if aphids has settled on them. Afford air by tilting the lights.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

Fruit Tree Budding.—The time is at hand when the budding of fruit-trees is performed, the bark running freely if copious rains occur to stimulate growth. The first kinds of fruits to be budded are Cherries and Apricots, Plums, Peaches, and Nectarines following in the order named. The buds should be plump and dormant, and taken from outside shoots of the trees, and having cut off the leaves and half the length of the petioles, drop the shoots into a deep water-can having 1 or 2 inches of water at the bottom. Make sure that each variety is correctly labelled, and that the label belonging to it is securely fastened to the first stock in the row operated upon. The budding is exactly similar to that pursued with the Rose, excepting that in the case of dwarf stocks, the bud should be inserted in the rind about 9 inches from the ground-level in the case of Plums, Peaches, Cherries for training on walls, Apples on the Crab, and Pears on the Pear-stocks. In the case of standards of the Cherry, the bud may be put in at 6 to 8 feet from the ground on stocks that have been two to three years planted, and once cut back in that time. The same practice is pursued with cider Apple-trees by some cultivators, in the belief that the wilding Crab makes a stronger stem to stand against animals than the ennobled Apple. The few varieties of Pear that do well on the Quince should be worked low down, so that the point of union may be covered with the soil at the first transplanting. In the course of a few weeks, if the leaf-stalk that was left on the bud drops off, it is a sign that the bud has taken; if, on the contrary, it withers, the bud is dead, and another may be inserted on the chance of its growing; and, in any case, the stock will serve for grafting in the spring, in the case of Pears, Apples, Plums, and Cherries.

Grape-vines growing against south and west walls should be kept well supplied with moisture at the roots, liquid-manure and clear water being afforded alternately. The berries should be properly thinned, more or less, according to variety. Keep the bearing-shoots pinched back to within one or two joints of the bunches, letting one shoot carry one bunch, and laying in a shoot at the base of each, to serve as the bearing-shoot another year. Be careful not to crowd the Vines with shoots, but keep them thinly distributed, so that the principal crop of leaves may attain full development; and remove entirely all the weak and superfluous shoots. Some cultivators lay in long shoots, and take two or three bunches from each; others adopt the short-spur method, retaining always a ground-work of old stems—and each has its advocates.

THE APIARY.

By EXPERT.

Adaptors.—Bell-glasses worked on straw-skeps (especially dome-topped ones) should always be set on a platform of thin board cut to the size of the glass. These adaptors, as they are called, enable the bee-keeper to remove the glass when full without breaking the combs, and unless used in this kind of bee-work, all kinds of mischief follows at times. It is

not uncommon for the bees to carry the combs upward as described above, but if the bell-glass is covered by a warm "coey," such as is used to keep the teapot warm, the bees will take possession of the glass, and soon find the guide-comb fixed above for them to build from. It is, however, too late to place bell-glasses on skeps in Kent. They should have been put on at least a month earlier. We have known a 10lb. bell-glass to be filled in four or five days or less in a good season.

Finishing off Sections, &c: Stocks that have Swarmed.—Hives which have sent off two or more swarms generally fail to complete any unfinished sections or supers which may then happen to be on them, therefore remove all surplus boxes, sections, &c., immediately on the issue of the second swarm, and give them to other stocks to finish. After the middle of July it becomes more and more difficult to get supers of all comb-honey finished off and sealed over. To give empty sections or supers very late in the season is useless; with care, however, and a little judicious handling, unfinished ones may be changed about from hive to hive till all are completed. When it comes near the end of the month, any unfinished sections left should be removed unless they can have a chance of being completed at the heather.

Extracting.—As the honey season draws to a close, bees usually begin to develop thieving propensities, and unless the mischief is guarded against, and promptly checked wherever possible, serious trouble may follow. The first symptoms may be detected by observing bees flying about the entrances of other hives than their own. When this is seen, great caution is required, and it will be found necessary to do all extracting indoors, and to keep the windows and doors of the apartment closed while the work is going on, to avoid attracting bees to the house. Be careful also not to get frames "mixed up" when a number are being operated on. Mark or number them so that they may be returned to the same hives, and occupy exactly the same positions as before. A very perceptible difference will in some years be found in the quality of honey in various hives, and when this is so, each kind should be graded and kept apart if the produce is intended for sale. We once more urge inexperienced bee-keepers never to extract from frames containing brood, all sorts of mischief are likely to result unless this precaution be taken. Return frames (after extracting) in the evening, and close up the hives quickly if any signs of prowlers are seen about. If the bees hang about sluggishly at the entrances of hives in hot weather, it is a sign the combs are full of honey, and no time should be lost in extracting from the outer combs when the bees will soon start work again.

Feeding Swarms.—Strong first swarms require feeding on cold wet days. Second swarms should, in all cases, have a few pounds of syrup given them, no matter how fine the weather, and full sheets of comb foundation whenever possible. Examine all second swarms, and swarmed stocks, to make sure that young queens are fertilised and laying. Second swarms must not be allowed to occupy more than four frames, to be increased to six or seven before the end of August, and when this number of combs are fully worked out, the bees will winter on them nicely. Hives raised up from their floor-boards for ventilation while the weather was hot, should have wedges removed as it becomes cooler. The same may be said of supers and sections as the season draws to a close; all surplus honey in whatever form it is being stored must be kept warm, or the bees will remove it down into the body of the hive. Second swarms require particular attention in the way of keeping them warm and cosy. It greatly facilitates comb-building when the bees are not very numerous, if the entrance is reduced to about 1 inch, and a board is kept firmly pressed down by weights over the quilts, provision being made for feeding regularly. Contrast the amount of work done in eight or ten days by a small lot of bees well treated and cared for, with the result given by the same number of bees put into a great cold hive with a couple of thicknesses of carpet thrown loosely on the entrance, left open full width, and the poor unfed bees left to take their chance.

ATTRACTIVE GUIDE-BOOKS.—Two handbooks, well written and attractively illustrated, have been issued by Messrs. BECHINGS, Strand. One of these is the *Daily Mail Guide to London*, and likely to prove useful to country cousins; the other is one of a series of illustrated homeland handbooks, and tells us of the beauties of Tunbridge Wells of to-day. It can be procured at the offices in the last-named town, as well as from the London publishers.

EDITORIAL NOTICES.

Fruit Crops of the Year.—The Report of the Fruit Crops will appear in our issue for July 31, and will be followed by remarks upon the same, running through several issues.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	JULY 24	Royal Botanic Society, Meeting.
TUESDAY,	JULY 27	Royal Horticultural Society's Committee. Tibshelf Horticultural and Rose Show.
WEDNESDAY,	JULY 28	Chester Horticultural Show (2 days). Carnation and Picotee Show at Edgbaston Gardens, Birmingham (2 days).
SALE.		
FRIDAY,	JULY 30	Imported and Established Orchids at Protheroe & Morris' Rooms 67 & 68, Chancery Lane, E.C.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three years, at Chiswick. —63° 3'.

ACTUAL TEMPERATURES:—

LONDON.—July 21: Max., 73°; Min., 59°.

PROVINCIAL.—July 21 (6 P.M.): Max., 67°, at York Min., 56°, at Shields.

THE meeting at Chiswick on the 14th inst., briefly alluded to in our last number, was a memorable one. It was a happy idea, and graciously carried out. The objects were to get the several committees together to inspect the gardens, and to give the council an opportunity of publicly thanking those fellows who do so much work for the Society without fee or reward, and with the sole object of supporting and aiding the Society in its duty of promoting the interests of horticulture. This object was felicitously alluded to at the luncheon by the PRESIDENT, who was warm in his appreciation of the labours of the committees. Rarely, if ever, have we seen "horticulture" better represented in its diverse aspects than at this meeting. Indeed, it very rarely happens that an opportunity is offered for a joint meeting of all the committees, but it was effected very satisfactorily on this occasion. The weather has not been propitious to out-door gardening at Chiswick this summer, but there was ample reason to congratulate Mr. WRIGHT and his staff on the generally excellent condition of the garden.

After the luncheon, the united committees met again under the presidency of Sir TREVOR LAWRENCE to discuss the question of the "better utilisation of the Society's gardens at Chiswick." The discussion was opened by Dr. MASTERS, who, in the first place, expressed the thanks of the committees to the Council for this valued opportunity of meeting in these time-honoured gardens. The past history, so glorious in the annals of horticulture, and illuminated by the work of SABINE, of LINDLEY, of DOUGLAS, of HARTWEG, of ROBERT THOMPSON, of GORDON, and latterly in particular, of BARRON, and others, was only lightly touched on, as the present conditions are so

different, that but little practical advantage could now be attained by attempting to imitate them. As for the present state of affairs, the Fellows had now an opportunity of judging for themselves; but it is questionable whether horticulture derives all the advantages from a garden directed by a Society, which has a scientific as well as a practical aspect, that it ought to do. This led the speaker to allude to Chiswick in its educational and its instructional aspects, leaving the more strictly practical details to the care of those more competent than himself. It was urged that the Chiswick garden should afford, so far as circumstances would allow, a complete object-lesson in which the visitors should be able to see gathered together in appropriate order, types of the best and most suitable varieties of fruits and vegetables, cultivated in the best possible manner. Chiswick would thus fill the place of a book of reference available to all classes of horticulturists. Comparative trials should be continued as now, and experiments made to test the value of manures, and various cultural methods, especially spraying.

Alluding to the instructional aspect of Chiswick, the speaker mentioned the horticultural schools of the continent, and especially the fifty experimental stations scattered through the United States. Concerning these, letters were read from Professor BAILEY and Professor WAUGH, showing the nature of the work done at these stations, and the great benefit they conferred on the horticulturist, and especially on the pomologist. The writers advocated the expediency of sending a competent pomologist to the States to observe and take note of the immense strides that branch of horticulture is making, owing to the association of scientific training with practical work.

"If," continued the speaker, "we cannot at present have a completely equipped school of horticulture, could not some arrangement be made whereby the Chiswick students might have the opportunity of attending the lectures given with so much advantage at Kew, whilst the Kew students in return might be allowed to avail themselves of the resources of Chiswick in obtaining a knowledge of practical fruit and vegetable culture? If Government aid could not be expected for these purposes, surely the resources of the county councils might be relied on to carry out educational and instructional work at Chiswick."

Sir JOSEPH HOOKER, the former Director of Kew, whose presence was hailed with the liveliest gratification, alluded to the great difference between the United States, where horticulture and horticultural education were "creations," and Great Britain, where they were the results of gradual evolution and growth. Sir JOSEPH alluded to the value of scientific training in horticulture, and to the success attending the Kew lectures. These, it appears, were not at first to the taste of the students themselves, who petitioned the Director that they might receive instruction in the formation of ribbon-borders! Alluding to DOUGLAS, and the magnificent services he rendered to the garden and to horticulture generally, Sir JOSEPH narrated how he was not only indebted to DOUGLAS for botanical teaching, but for instruction in fishing, and once, when so engaged, a slip into the water occurred, and had it not been for the ready aid of DOUGLAS, he (Sir JOSEPH) might not have been addressing the meeting at the present time.

The discussion was continued by Sir TREVOR LAWRENCE, Dr. PLOWRIGHT, Dr. RUSSELL, and

Mr. HARRY VEITCH, the last-named gentleman pointing out that in his opinion the Chiswick garden was too small, and its atmosphere too vitiated, to be utilised as an experiment station.

Dr. PLOWRIGHT concurred with Dr. MASTERS, that experiments on spraying should be conducted at Chiswick, so as to ascertain when and how it might be judiciously applied. He observed that in a vitiated atmosphere, where sulphur was largely present, fungoid attacks were almost absent, and so Chiswick was, in one respect, in a good position. Dusting with sulphur, burning affected plants, Bordeaux Mixture, and sulphide of potassium, had in turn been asserted as cures for fungus attacks, but it was only by practical experience that the value of either could be obtained, and Chiswick was the place where experiments for such discovery could well be conducted.

The Rev. W. WILKS read letters from M. H. de VILMORIN and Mr. MALCOLM DURN, both gentlemen expressing the hope that, whatever was done at Chiswick, its value as a trial-ground for varieties of vegetables, fruits, and flowers should in no way be impaired; for they considered no such independent trials as here conducted were possible elsewhere, and the decisions of the various committees were looked up to by the majority of horticulturists.

Sir TREVOR LAWRENCE proposed a vote of thanks to Dr. MASTERS, and said in effect that the whole question resolved itself into a monetary one. He had not much hope that the county councils would help them; and as for the Government, it would willingly give a million pounds for an ironclad, but would laugh at an application for £1000 to advance scientific and practical horticulture. Dr. RUSSELL seconded the motion, and it was unanimously carried.

CUPRESSUS MACROCARPA. (THE MONTEREY CYPRESS).—The photographs (figs. 17, 18) give a very good idea of the habit and picturesque aspect of Cupressus macrocarpa growing in its natural habitat on the Monterey peninsula, on the Pacific coast of California. They have been forwarded to us by Mr. THOMAS LEE, Superintendent of Gardens and Grounds, Hotel del Monte, Monterey, who, in referring to them, says:—"The photographs illustrate the great variety of habit and the picturesque appearance of the Cypress (C. macrocarpa) growing in its native wilds, and show some of the more attractive 'bits' of the famed Cypress Grove, through which runs the favourite 'Eighteen-mile Drive' round the peninsula. The Grove lies along the south coast of the peninsula, from Pebble Beach to Point Cypress, a distance of about 3 miles, and extends to a considerable distance inland. The coast rises into high bluffs at the Point, but even there the Cypress grows, and holds its own with its roots clinging firmly to the rocks, in the teeth of the full sweep of the salt-laden blast from the Pacific Ocean; their stems gnarled and twisted, and tops much bent and flattened, no doubt, but still maintaining their health and vigour to a good old age. In the shelter further inland, the Cypress assumes the stature of a small tree, with a straight stem of considerable height and thickness—a girth of 12 feet, at 5 feet up, being not uncommon. The Cypress Grove is almost pure Cupressus macrocarpa, but beyond its limits the Cypress is generally found mixed with Pines—of which Pinus insignis is the chief species—Oaks, Buckeyes (Pavias), Maples, and other deciduous trees."

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual outing of the members of this Society took place on the 19th inst., a large party of the members proceeding to Henley by rail, and then going by water to Greenlands, Henley-on-Thames, the residence of the Hon. W. F. D. SMITH, M.P. After visiting the gardens and pleasure-grounds, the company dined in a spacious tent, under the presidency Mr. T. W. SANDERS, the chairman of the committee.

FIG. 17.—CUPRESSUS MACROCARPA IN THE WILD STATE. (SEE P. 52.)

FIG. 18.—VIEW IN THE CYPRESS DRIVE, MONTEREY PENINSULA. (SEE P. 52.)

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Skinners' Company and the Merchant Taylors' Company have each contributed the sum of £10 10s. to the funds of the Gardeners' Royal Benevolent Institution.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society Committees takes place on Tuesday, July 27, in the Drill Hall, James' Street, Victoria Street, at 12 o'clock. At this meeting a Silver Flora Medal is offered for competition (amateurs) for the best collection of Cactaceous plants. At 3 P.M., Mr. W. D. DRURY will give a paper on "Familiar Garden Insects, Friends and Foes."

CHESTER HORTICULTURAL SHOW AND FÊTE.—The programme of the second annual Chester Horticultural Show and Fête, so successfully inaugurated on the Roodie last summer, is now complete, and details will be found in our advertising columns. The exhibition is fixed for Wednesday and Thursday, the 28th and 29th inst., and everything points to success. Some idea of the comprehensive nature of the prize list may be formed from the fact that the substantial sum of over £500 is devoted to the awards, and keen competition is anticipated from noted exhibitors all over the country in flowers, plants, fruits, honey, &c. Mr. F. A. WALKER-JONES, Grosvenor Chambers, Newgate Street, Chester, is the secretary.

HORTICULTURAL CLUB.—An excursion of the club will take place on Wednesday, 28th inst., the following are the arrangements:—The members of the party will leave Moorgate Street 10.24 A.M., St. Pancras 10.45, both joining at Kentish Town at 10.49, where there will be two saloon carriages. Arriving at St. Albans 11.35, brakes will be in readiness there, and after visiting the abbey the party will drive to Childwickbury, the seat of Sir BLUNDELL MAPLE, Bart., M.P., who has invited them to luncheon. They will afterwards drive to Aldenham, the seat of Lord ALDENHAM. Tea will be provided, and the party will return from Elstree Station to London.

VEITCH MEMORIAL TRUSTEES.—Mr. JOHN BENNETT-POE, of 29, Ashley Place, S.W., and Mr. OWEN THOMAS, of the Royal Gardens, Frogmore, have accepted the vacant places in the Trust caused by the deaths of Mr. WILLIAM THOMSON and Dr. ROBERT HOGG.

THE NORWICH ROSE SHOW.—Mr. ED. MAWLEY obliges us with the following particulars:—The northern exhibition of the National Rose Society, which was held on the 15th inst. in conjunction with the Norfolk and Norwich Horticultural Society, was a most successful one. The total number of exhibition-Roses staged in the joint show, amounted to 3590, which is 500 more than the average for the previous five northern shows, and greater than at any similar exhibition of the Society, with the exception of those held at Birmingham in 1890, at Chester in 1892, and at Derby in 1895. There were in all fifty exhibitors and 220 exhibits. Arranging the latter according to the number contributed by each county, they are as follows:—Norfolk 55 exhibits, Essex 46, Herts 32, Suffolk 23, Notts 15, Oxford 9, Surrey 8, Derby 7, Worcester 7, Cambridge 4, Yorkshire 4, Leicester 3, and Middlesex 3. Nearly 7000 persons visited the show, which is a record attendance for a summer exhibition of the local Society." (See also p. 53.)

SUDBURY, WEMBLEY, AND ALPERTON HORTICULTURAL SOCIETY: July 17.—The annual exhibition was held on the above date in the grounds of Fair View, the residence of F. LEETE, Esq. The show was most successful, with the exception that it was rather early for some of the vegetables.

SHIRLEY AND DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.—The monthly meeting of this Association was held on Monday, the 19th inst., in the Parish-Room, Shirley, Southampton, Mr. E. LADHAMS in the chair.

Roses were shown in some quantity, but owing to the heat of the past week or two the blooms were not of much merit. The best twelve blooms and the best Rose in the show were staged by Mr. J. HALLETT, gardener to the Rev. W. G. RUDGE. Mr. ROGERS, Red Lodge Nursery, and Mr. B. LADHAMS, Shirley Nursery, sent collections of Roses; the latter showing likewise herbaceous perennials as cut flowers. A discussion on the exhibits took place towards the end of the day.

TREE-PLANTING IN RHODESIA.—Jubilee Day was observed as a great tree-planting day in honour of the Queen. But the distinctive feature of the celebration was that each white man who planted a tree had himself to dig the hole for it, 3 feet in diameter and 3 feet deep. The planter was allowed to obtain the help of a friend in this task, but the essence of the celebration was that the hole should be made by the white planter himself. He was not allowed to hire a native to do the work for him. This labour was regarded as "a voluntary act of individual homage to the Queen." The Administrator, Lord GREY, himself set the example, and the natives on Jubilee Day saw a strange sight—white men voluntarily doing what they contemptuously call "Kaffir work" in honour of the Great White Queen over the water. *Daily News.*

HAMMERSMITH HORTICULTURAL SOCIETY.—The 13th annual exhibition of this Society, held on the 15th inst., was made the occasion for a little much-needed enterprise on removing the *locale* of the show from St. Peter's schools to the Grove, Hammersmith. In the amateurs' division for a group of plants arranged for effect, the leading prizes were taken with meritorious displays by Mes-srs. WOODHOUSE and BROMLEY, and from the gardens of Merton Lodge, Chiswick (Mrs. Lloyd), were several noteworthy prize contributions. One of the features of the show was the non-competitive element—good groups of foliage and flowering plants being sent by Mr. J. GIBSON, gr. to E. H. WATTS, Esq., Chiswick; Mr. WEST, gr. to Mrs. BRANDON, Oakbrook, and Mr. J. J. Hillier.

THE CHANOUSIA ALPINE GARDEN.—The Alpine Botanic Garden of the Chanousia, mentioned in our issue for June 26, is at an elevation of nearly 7,000 feet; is a quarter of a mile from the French frontier, on Italian territory, and close to the Hospices of the Little St. Bernard. It is proposed to include in it all plants from the Piedmont and Cenisian Alps. The Jardin Alpin d'Acclimatation of Geneva has contributed 600 species of plants to the garden, where it is hoped that they will do well under the sunshine of the Italian Alps. The inauguration of the garden will take place on the 2nd (not 1st as previously stated in error) of August next.

BOTANIC GARDEN OF RIO DE JANEIRO.—From the Botanic Garden of Rio de Janeiro comes a Report, by Señor J. BARBOSA RODRIGUES, of new plants under cultivation at this institution. These include *Passiflora paraybensis*, *Posoqueria calantha*, *Aristolochia echinata*, *Aecrocomia Mokayayba*, *Scheelea osmantha*, *Orbignya speciosa*, *Pindarea* and *concinna* and *fastuosa*. All these plants are described and classified carefully, and illustrated by clear and useful plates. In acknowledging his indebtedness to the monographs of *Passifloraceae* (and *Aristolochiaceae*) the author has omitted the final s from the name of his authority.

ISLE OF WIGHT.—On Wednesday, July 14, over fifty members of the Isle of Wight Horticultural Improvement Association visited Brooke House and Gardens, the residence of Sir CHAS. SEELY, Bart., President of the Society. Led by the President, the party inspected the park, the miniature lakes, cascades, rosaries, terraces, and a large Oak, which was planted by GARIBALDI in 1864. Then a tour of the extensive hot-houses was made. The Peach-houses contain 3000 square feet of glass. Stove, Orchid and green-houses, and vineries were all in good condition. The crops of hardy fruits at Brooke are below the average; but the kitchen garden crops, with the exception of a few rows of Potatoes which were afflicted by disease, were very promising.

THE GARDEN GUINEA.—The Grand Junction Waterworks Co. has gained its cause in the appeal case on the test action recently brought to discover if that body had authority to charge on the entire assessment of houses and grounds, and to impose an extra guinea on the garden for watering purposes. Mr. DAVIES, the respondent in the above case, was the owner and occupier of premises in Grange Road, Ealing, consisting of a dwelling-house and of a garden, greenhouse, and tool-shed, forming part of the curtilage of the house. The water company's charges were regulated upon an assessment of the entire property, whereas the respondent suggested that the garden formed no part of "the tenement supplied with water," and that the assessment of it as of premises which might be entirely separated from the dwelling-house, should be excluded. Mr. Justice HAWKINS found that the whole of the curtilage of the house formed the residential tenement supplied with water, and gave judgment accordingly, leave to appeal being refused.

"OUR LADY OF THE SNOWS."—Our Canadian brethren seem rather unnecessarily to resent the epithet applied to their northern land by RUDYARD KIPLING. We have had too many evidences of the superb quality of her products not to know that Canada is not always wrapped in snow. In the current number of the *Canadian Horticulturist*, Mr. KIPLING is invited "to bring his summer clothes and see our splendid weather." A great many of our scientists and doctors are going this autumn, when no doubt they will see something of the fruits thus described:—

"Apples, Peaches, Plums, and Cherries,
With five hundred kinds of berries;
Pears, Apricots, Grapes, in this country grow.
Swaying in the balmy breeze,
Quinces, Figs, nut-bearing trees,
All are products of the Lady of the Snows."

THE VICTORIA REGIA in the Royal Botanic Society's Gardens at Regent's Park is now worthy of a visit by those who happen to be in the neighbourhood, and have not previously seen this fine Lily. A few days since the plant had ten fairly large leaves and several flowers opening.

THE CONSUMPTION OF FRUITS AND VEGETABLES IN MANCHESTER.—How a great city is fed forms the subject of the opening paper of the *Journal of the Royal Agricultural Society*, in which Mr. BEAR deals with "The Food Supply of Manchester," where the Royal Agricultural Society held its annual meeting last month. Vegetable produce alone is dealt with on this occasion. New Potatoes appear to be in supply practically all the year round, the first arrivals being from the Canary Isles and France at Christmas time. The counties of Chester, Cambridge, and Bedford are among the chief sources of home supply. In the first three months of the year large quantities of Broccoli are received from Cornwall, often as much as 200 tons a day. Supplies from the Midlands follow, and Holland likewise sends large quantities. Cabbages arrive first from Evesham, then from around London, and later from Lincolnshire and Cheshire. Several Manchester salesmen who have entered into market-garden operations at Evesham, at Torrington (Norfolk), and at Swineshead (Lincolnshire) are said to have realized as much as £100 per acre for their Cabbages. Early Green Peas come from Algeria, Spain, and France, followed by supplies from Evesham, Nottinghamshire, and Yorkshire. The Channel Islands send the earliest French Beans. Celery is largely grown locally, and is in the market from July to April. France, Spain, and Italy send early Asparagus, whilst the greatest source of the home supply is the Evesham district. Mushrooms are in great demand, and come mainly from Kent, the districts around London, and other parts of the South of England. The home supplies of Onions—chiefly from Bedfordshire—are being forced out by foreign importations; last year 91,000 cases of Valencia Onions, and 25,000 bags from Egypt, were conveyed into Manchester by the Ship Canal alone. Cucumbers, Lettuces, Radishes, and other kinds of salad are extensively grown in the

neighbourhood; whilst Watercress is sent mainly from the counties of Oxford and Bucks. Much forced Rhubarb is sent from the Leeds district, the unforced supplies being grown mostly within carting distance of Manchester. There is no better market in England for Damsons, the supplies being obtained chiefly from Worcestershire, Shropshire, Cheshire, Lancashire, Derbyshire, and Wales. Of Strawberries, the Brest district of France is the main source of the early supply, from 8000 to 10,000 boxes per day being sometimes received. Cornwall, Southampton, and Swanley, follow in succession, as many as 300 tons a day having been known to arrive from the last-named district. Kentish fruit, picked early in the morning, arrives in Manchester in the afternoon of the same day. There is a great trade in Bilberries, 10,000 baskets of 8 lb. each having arrived in the market in one day last year; they mostly come from Germany, whilst Worcestershire, Wales, and Ireland, send the bulk of the home supply.

is concerned, the first Pompon was Little Wonder, raised at Handsworth, near Birmingham; and that this type is of home rather than German origin, as stated in our article. Messrs. POPE & SONS fail to supply any date when the variety, Little Wonder, was raised. We have it on the authority of the late Mr. SHIRLEY HIBBERD, who devoted a great deal of attention to the history and development of the Dahlia, that the origin of the Pompon type dates from about 1808, when HARTWEG of Karlsruhe obtained a double variety from the single Dahlia coccinea (orange-red). "The Dahlia was received in 1789 by Cavanilles of Madrid, from Mexico, and in several forms, to three of which he gave specific names. Then, in 1803, A. VON HUMBOLDT sent fresh seeds of these forms from Mexico to France, and from Paris the Dahlia got generally distributed. *D. coccinea*, with two others, viz, *D. pinnata* and *D. sphondyliifolia*, were the three original types, the first-named being the shortest in stature, and the most tender. For a

the end of the fifties, all of very tall growth. Since 1880 quite dwarf growing varieties have been originated, and thanks to the efforts of Messrs. TURNER KYNES & Co., J. T. WEST, CHEAL & SONS, and others, the Pompon Dahlias have been greatly improved and extended, and are now most valuable for exhibition, border, and cutting purposes. As further showing that the recognition of the Pompon Dahlia as a distinct, useful type, is a matter of comparatively recent occurrence, it may be mentioned that during the time the National Floricultural Society was in existence—from April, 1851, to the end of 1858—there is no record of Pompon Dahlias having been exhibited at any one of the meetings; and so far as the published awards of the Floral Committee of the Royal Horticultural Society show, no certificate was given to a Pompon Dahlia until 1875.

HOME CORRESPONDENCE.

AN ARTISTIC BLEND CONVERTED INTO PRACTICE.—Referring to this subject in a recent issue, the combination of Lily of the Valley and Woodruff is very familiar to me from my own practice of it a generation since, and it is a very lasting ornament when grown unexposed to sun after 11 or 12 o'clock. The scent of the Woodruff is manifest in its surroundings as in so many other plants in flower, principally near sunset. The high aroma of the herbage is conspicuous at all times on rubbing a few leaves between the palms of the hand, which retain the aroma for hours. It is this herb which is popularly used in Germany for "*maitrunk*." As hock, which is required for this tasty and refreshing beverage (with a moderate amount of sugar added, and a small handful of the herb per quart or according to taste, and left in the wine for nearly an hour before drinking the beverage), may seem costly in this country, I strongly recommend as a substitute a quart bottle of good sparkling cider, which will assume all the properties for which *maitrunk* is esteemed if similarly treated, with the omission of sugar, as cider has not the acidity of hock, and it will be found a delightful beverage in spring and early summer, or as long as the herb retains the aroma in the milder form, viz., in its young state. The combination might perchance contribute to render cider the popular drink towards which achievement so many efforts are being made. *H. H. Raschere, Forest Hill.*

A NOBLE SCOTCH FIR.—I have a vivid recollection of a visit paid in company with several fellow gardeners, some twenty-seven years ago, to a very fine Scotch Fir, which then and still stands in a small wood close to the road leading from Romsey to Southampton, and in a corner of the Broadlands estate. Being recently in that locality, I went a little out of my way to see this fine tree once more. Since previously seen, it seemed to have altered nothing, not a branch having been lost, although in all directions about the district trees had been thrown by a previous hurricane in considerable numbers. Having a tape with me, I was enabled to measure the stem 4 feet from the ground, and found it to be exactly 13 feet, thus giving a diameter of 4 feet 4 inches. When measured twenty-seven years previously at the same height, the circumference was just over 12½ feet, so that apparently not much expansion had taken place during that long period. Judged by that ratio of growth, the tree might be several hundreds of years old. The stem is singularly clean and handsome; it is as round and bright as a ship's mast, and runs 30 to 40 feet in height ere it divides, then goes to a considerable height, being capped by a fine round head. For a Scotch Fir, I regard this as a wonderful as well as a very noble tree, and well merits notice and preservation. The Selborne Society might well devote some of its energies to the cataloguing, preserving, and describing the grand old trees of the kingdom. Would that every one of these vegetable monarchs could have a plate affixed, giving name, probable age, dimensions, &c. I have no doubt there are finer Scotch Firs in their native habitat, but this one is, I think, a record example for the South of England. *A. D.*

WASPS AND ROSES.—I am interested in Mr. G. Paul's note upon the above in your issue for July 17. In 1893 we had a perfect plague of wasps, and it was during that summer that I first noticed them eating Roses; not merely the Rose leaves, but blossoms and hard buds as well. At first I imagined they were in

PORTRAIT OF ANDRÉ LENOTRE. (SEE P. 45.)

The trade in Tomatoes, although of quite recent origin, is already immense, and there are firms which dispose of 600 to 1200 packages of 12 lb. to 15 lb. in a day when business is in full activity. The home supply is gaining ground upon that from Jersey and Guernsey; and yet from the beginning of May until late in the autumn the supply from the Channel Islands is so large that two or three railway companies give a special daily service to Manchester. Much useful information is given on freight charges, and on the expenses of large and small producers respectively. The general conclusion arrived at is, that market-gardening and fruit-growing appear to be still fairly remunerative industries when even moderately well managed, and highly profitable when conducted by men of special energy and keen business capacity. Manchester, moreover, is one of the best markets in the world for the distribution of vegetables and fruit. *Times, July 20.*

THE ORIGIN OF THE POMPON DAHLIA.—Messrs. POPE & SONS, nurserymen of Birmingham, write in reference to our article upon plants of the Victorian Era, that a belief exists in their neighbourhood that, so far as the Pompon Dahlia

long time the plant remained sterile. From the crossing of these three types have originated the Dahlia variabilis of the present day in its unending varieties." (*Pflanzen-Mischlinge*, by WILHELM OLBER FOCKE, p. 197.) This new type appears to have "caught on" in Germany, as the fanciers of the Dahlia there favoured the small flowers, which obtained the name of Lilliputians, on account of the small size of their blossoms. It also appears to be quite certain they were originally known in this country as German Dahlias, thus proclaiming the country in which the type originated. As an illustration of the fact that the popularity of the Pompon Dahlia dates from a comparatively recent period, it may be stated that at the first National Dahlia Show, held in St. James' Hall, London, in 1858, Pompon Dahlias were not invited, though the dwarf bedding varieties of that date were. Up to 1833, the term Pompon appears not to have been recognised, as when mentioned by writers in the floricultural publications they were known as Lilliputian or Bouquet Dahlias, and they were only just beginning to attract attention; but it was not until the seventies that the type was more largely recognised. We remember the varieties in cultivation at

search of insects, or at least the sweet juicy exudations from an injured bloom or leaf. But it was not so, for in several instances plants that were perfectly free from such were seriously attacked. I may give one instance in particular. At the end of a long Rose-house were two plants of Marie Van Houtte on the outside wall, and well in bud and blossom. Suddenly the wasps took to eating these, and in the course of a few hours had quite ruined the trees for that season. They were most persistent in the attack, and syringing only irritated, without completely stopping them. Whether in the bud or full blown, every flower-bud was soon demolished. Nor did they seize a portion and fly off with it, as we frequently notice when they are collecting food for their larvae; in this case they positively fought for possession, and stayed eating until driven away by a stronger or more eager wasp. Less than half-a-dozen yards off there were heaps of fruit, and for a time this was comparatively neglected, a change to Rose diet being evidently the inducement. Since then I have more than once seen wasps feeding, and also nipping off portions of Rose bloom and leaf, as described by your correspondent. In the latter case I have little doubt the chief object is the manufacture of paper-like substance for building the nests, having traced them direct to their nesting-place when near. I have also seen them particularly busy in the same way with other foliage, but never more so than upon the Alder by river sides. In each case I have failed to find any insect or other food; and as soon as a piece was properly severed and packed, as it were, the wasp made straight for some given point. *A. Piper.*

WHITE LILIES AND OTHERS.—We have *Lilium candidum* (type) and *L. candidum* var. *Sultan Zambach* in flower together now. *L. candidum* varies a good deal more than is generally supposed, hence possibly its erratic growth at Straffan. *L. candidum* type has branching spikes, strong and vigorous; while *Sultan Zambach* is nearly killed off by the Lily fungus. At Newry, *L. candidum* var. *speciosum*, with chocolate-purple coloured stems, 7 feet high, is very distinct, and makes luxuriant growth. We have here also *L. candidum* fl.-pl., so called (all bracts), and *L. candidum* striatum, with purplish streaks on the perianth-lobes. We have also now in bloom one, if not two, varieties of *L. Martagon* fl.-pl., an old double Lily not now often met with. *Mariac's Water Lilies* are rampant and flowery here now; our pond is so full of them that we cannot get our little punt through the masses of leaves and flowers. What a glorious gain these *Nymphæas* are! *P. W. Burbidge.*

FROST IN JULY.—I have noticed the remarks in the *Gardeners' Chronicle* of last week on a frost in July, and as I happen to have a grass thermometer, and keep a record of the temperature, it may be interesting to your readers if I give the readings for the last ten days. I have kept a register for more than fifteen years, and most of that time in the highlands of Scotland, and have never registered so low a ground temperature before. I will take the ten days dating from July 7, and give the minimum in a Stevenson's box, and on the grass, viz.:—

1897.	Min.	On grass.	1897.	Min.	On grass.
July 7	48°	31°	July 12	48°	30°
" 8	41°	23°	" 13	48°	34°
" 9	54°	37°	" 14	51°	32°
" 10	55°	35°	" 15	49°	28°
" 11	45°	28°	" 16	52°	32°

The sky on these nights was very clear, and the wind came mostly from the north-east. *John Killey, Warwick.*

NARCISSUS BERNARDI.—The question is often asked—Does it do any harm to Daffodils to keep them out of the ground for a few weeks? My reply is, it depends on the kind. Those which have bulbs of a loose texture—which may be tested by pressing the bulb between the finger and thumb—should be replanted soon after being dug up. *Narcissus Bernardi*—a name given to the wild hybrids of *N. poeticus* and *N. pseudo-Narcissus*—generally has bulbs of a very loose texture. If these are kept too dry when out of the ground, they are liable to dry up till they are all husk; if too damp, they often rot. I have in former years lost many from one or other of these causes; so, never keep them long out of the ground when dug up for division. *C. W. Dod, Edge Hall, Malpas.*

THE LATE JOHN FINLAY.—I notice with regret the death of this excellent gardener and naturalist in your issue of the 17th inst., and should be pleased if you will allow me to correct a slight mistake that appears in the Obituary notice. John Finlay began his gardening career in the garden of Netherwitton Hall

in 1858, he being then about 22 years of age. I was collecting native plants at that time, and he joined me in the hobby. We collected all round Netherwitton, and as far as Sunday rambling would permit. The specimens were dried, I remember, on the top of the old boiler-furnace, a rough-and-ready method, but the drying was very successful; they were then, in the winter evenings, mounted, named, and classified on paper procured from Edinburgh for the purpose. It was I who gave him instructions in naming and classifying from Hooker and Arnott's *British Flora*—a book that I have still. I left Netherwitton in the autumn of 1859, and he shortly afterwards, to go to Mitford Hall, and since that time I only saw him once, in 1860. I am astonished at the extent of his collections. *R. Gray, Convent Cottage, Carisbrooke, Isle of Wight.*

AZOLLA FILICULOIDES.—This exquisite little aquatic cryptogam is again most luxuriant, and is fruiting very freely in an open-air tank in the Botanical Gardens of Trinity College, Dublin. It is very beautiful in the early morning, when its flat fronds are thick set with drops of water or dewdrops, that glisten and sparkle like so many diamonds in the sunshine. Apart from its botanical interest, the plant is very pretty as seen floating in tanks, or shallow rock-pools of water in the Alpine gardens; or it may readily be grown in a pan or tub of muddy water anywhere. A supply is available, and will be sent to any botanist or botanical garden from whom or which a stamped and addressed address-label is received. *P. W. Burbidge.*

NURSERY NOTES.

REDBRAES NURSERIES, EDINBURGH.

HERE, on part of the old site of Messrs. Dicksons & Co.'s nursery, where for many years Mr. James Grieve was so well known and universally respected as manager, I found this veteran horticulturist and his two sons establishing his new business. The old firm, while retaining its seed shop at Waterloo Place, has met the fate of so many London and other great city nurserymen, that of being forced further out of town in search of more room, the builder treading closely on the heels of the cultivators. A considerable area is, however, still under cultivation, every inch of which out-of-doors and under glass, being packed full of nursery stock of all sorts in the most robust health and cleanly condition.

Of the twelve or more large glasshouses, six of the prominent are devoted to Tomatoes, cultivated on the latest and most approved principles, and hastening into fruit in succession throughout the summer. Like other successful growers of fine fruit, Mr. Grieve assured us that he has never any difficulty in disposing of his produce. Should he grow 50 tons, the demand would rise to 100; 100 tons, he should probably be asked for 200. The demand seems insatiable, and the prices for the best produce are well maintained.

Mr. Grieve's favourite varieties are *Conference*, *Sutton's Al*, *Comet*, *Stirling Castle*, *Austin's Eclipse*, and two new American varieties of great promise, *Honor Bright* and *Dominion Day*. As the Tomatoes are cleared out of these roomy houses the *Chrysanthemums* and bedding-plants are taken in, until every inch of space is once more filled with profitable autumn and winter crops. Three or more houses are devoted to *Ferns*, in which the more useful *Pteris*, *Asplenium*, *Adiantum*, of all the most popular and useful varieties and sizes for decorative and cultural purposes. *Pteris cristata*, *P. cretica*, *P. Wimsetti*, *P. tremula*, *P. serrulata*, *P. nobilis*, *Asplenium nobile*, *bulbiferum*, *biforme*, *pumilum*, *laxum*, *Adiantum* or *Maidenhair Ferns*, such as *A. cuneatum*, *Williamsii*, *gracillimum*, *Capillus veneris*, *Farleyense*, &c., abounded in all directions. A fine stock of *Cyrtomium falcatum* and the equally useful *Nephrolepis Phillipinensis*, and a good collection of *Selaginellas* were in these three well-stored Fern-houses. Table-plants in the form of the most chaste and suitable *Palms*, *Dracenas*, *Ficus elastica*, *Aracaria excelsa*, *Aralia Sieboldii*, *Aspidistra*, &c. Almost an entire house is devoted to the now indispensable *Smilax*, now as essential for the light and graceful finish of floral decorations as the Tomato is for food. Large quan-

tities of *Asparagus plumosus* are also grown. Other houses are filled with tricolor, silver, bronze, and other bedding and greenhouse *Pelargoniums*, *Fuchsias*, *Begonias*, *Lilies*, and *Spiræa astilboides*. Quantities of flowers are also grown for bouquet-work and house and table decorations. Several pits are devoted to the propagation of *Conifers*, *Ampelopsis*, and other trees and shrubs, which seem to root like weeds under the skilful manipulation and management of the head of the firm. A frame is also well packed with a choice collection of hardy herbaceous plants in pots. We also noticed a good collection, including almost all the old favourites, in herbaceous beds, and long borders in the open. Also large beds of seedling and named *Carnations*, *Pinks*, *Pentstemons*, choice *Antirrhinums*, *Delphiniums*, *Lupinus*, *Phloxes*, &c. A large space is devoted to the growth of *Dahlias*, *Asters*, *Stocks*, and show and other varieties of *Pinks*, and *Carnations*, throughout the summer and autumn. Special attention is given to the raising of spring flowers, such as *Wallflowers*, *Aubrietias*, *Alyssum*, *Arabia*, *Myosotis*, *Polyanthus*, *Auriculas*, *Sweet Peas*, in choice collection for cutting; *Mignonette*, *Pyrethrums*, and the new and beautiful *Marguerite Princess May*, which is grown in quantity. Hardy trees and shrubs receive special attention, such as *Conifers*, *Hollies*, *Laurels*, *Skimmias*, hybrid *Rhododendrons*, *Olearia Hawati*, &c. We also noticed a very complete collection of the New Zealand hardy *Veronicas*, numbering some thirty species or varieties. We noted among them *Veronica glauca*, *V. coerulesa*, *V. Anderssonii* var., *V. salicornioides*, &c.

A good collection of hardy climbers, such as green and golden *Ivies*, *Virginian Creepers*, *Hops*, *Honeysuckles*, and *Clematis* are kept in pots.

From Mr. Grieve's antecedents, and as the raiser of James Grieve Apple, it need hardly be said that Apples, Pears, Plums, Cherries, Gooseberries, Currants, Raspberries are duly cared for; and the leading sorts of Strawberries, the true *Garibaldi*, *Royal Sovereign*, and Mr. Carmichael's new seedlings the *Prince* and *Princess of Wales*, carefully grown for trade purposes. But though Mr. James Grieve has done good work among fruits, trees, shrubs, hardy herbaceous flowers and plants through his long and busy life, it is as a florist and as the father of the modern *Violas*, that he is best known and most highly honoured. I must therefore take leave of him and his promising business for the present amid his favourite flowers, *Pinks*, *Carnations*, *Violas*. He grows large collections of the former, as well as a big bed of seedling *Carnations* for cutting; also every garden *Viola* worth growing, and a large collection of exhibition *Violas* and *Pansies* in an extensive range of cold frames, and also planted out.

Mr. Grieve speaks highly, as well he may, of his new bronze-bedding *Viola Joseph*, with its richly suffused yellow and golden petals and deep bronze eye. Mr. Grieve kindly named the following as the best bedding sorts:—*V. Bullion*, *Archie Grant*, *The Mearns*, *Countess of Kintore*, *Countess of Hope-toun*, *True Blue*, *Wm. Niel*, *Duchess of Fife*, *White Duchess*, and *Marchioness*. *D. T. F.*

LAW NOTES.

IMPORTING FLOWERS FROM FRANCE.

THE LIABILITY OF CARRIERS.—In the Westminster County Court, recently, his Honour Judge Lumley Smith, Q.C., had before him the case of *Dezilippi v. the London, Chatham & Dover Railway*, in which the plaintiff, a dealer in flowers, carrying on business in Drury Lane, sued the defendant company to recover the sum of £19 4s., being the value of ninety-six baskets of flowers consigned to him from Nice, and which were rendered useless in consequence of delays in delivery. The plaintiff's case was that the goods were consigned to him by mail route in order to facilitate rapid delivery, but owing to the defendant having sent them by cargo-boat, they were delayed some twelve hours in delivery, and when they did arrive they were absolutely rotten, and useless for market.

The plaintiff was called, and said that the full consignment was 103 baskets, and out of that number only seven baskets were delivered in time for the market.

Mr. Groves, solicitor, appeared on behalf of the Company, and said the defence was that the goods were delayed owing to the French train arriving late at Calais. A number of witnesses were called to give evidence in support of this contention; but it transpired that the flowers were packed in the hold of the ship instead of being placed upon the deck, where they could have been easily got at upon their arrival at Dover, and the consequence was the things were not sent on to London by the 10 o'clock train, as they might otherwise have been.

His Honour said he thought the defendant, in packing the flowers in the hold of the ship, had placed them in a position of safety; but at the same time, they had so placed them that they could not be got at until they were useless. Judgment therefore would be for the plaintiff for the full amount claimed, with costs.

A DISPUTED SEED BILL.

In the Westminster County Court recently the case of Cox v. Firmin was before his Honour Judge Lumley Smith, Q.C., and was an action by the plaintiff, a seed merchant, carrying on business at Covent Garden, to recover the sum of £4, for various seeds supplied to the defendant, a gardener, carrying on business at Streatham. The defendant admitted the order and delivery of the goods, but said they were not what he ordered, and that was the reason why he objected to paying for them.

Plaintiff's representative said the goods were supplied over a year ago, and this was the first time that any suggestion had been put forward to the effect that the goods were not according to order.

His Honour said the defence was a ridiculous one, and gave judgment for the plaintiff for the full amount claimed, with costs.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JULY 13.—Present: Dr. M. T. Masters, in the chair; Mr. Veitch, Dr. Bonavia, Rev. W. Wilks, Prof. A. H. Church, and Rev. G. Henslow, Hon. Sec.

Malformed Fungi in Mushroom Bed.—A letter was received from Mr. Taylor, Penbridge, Mold, criticising the reports sent to the last meeting with reference to the loam, as he had splendid results last year with the same loam cut from the open pasture. As the specimens have been lost in the transit to Kew, the committee has been unable to receive the report of an expert upon the fungi themselves.

Cucumber with Adherent Leaf.—A specimen was received from Mr. E. Horsley, gr. to Rev. W. Wilks. The petiole of the leaf had become fused with the base of the fruit, the result being a distortion in the latter—a not uncommon phenomenon.

Cattleya, Synanthic.—This was a fusion between two flowers, the effect being to arrest some parts of the whorls, so that each flower became dimerous. There were two lips.

Poppay with Pistiloid Stamens.—A flower of *Papaver Rhoeas* was exhibited with this peculiarity. It is rare in this species, but not infrequently in some others, as the Icelandic.

Chemical Composition of Cattleya.—Two papers prepared by Mr. Smee were laid before the committee by Mr. Veitch, to whom they had been addressed, as Chairman of the Orchid Committee. The first contained some figures connected with the composition of the atmosphere; analyses of old and young pseudo-bulbs were also given, and of the flower, including observations upon the colouring matters of plants. Professor A. Church, having given careful consideration to the first of the two papers, reserving the second for a future meeting, remarked that Mr. Smee had scarcely paid sufficient attention to the more recent analyses of the atmosphere and of rain; the amount of CO₂ in the free air over land and sea being now found to be almost absolutely uniform everywhere (except where locally contaminated), and less in quantity than 3 parts in 10,000, so that no conclusions could be drawn from the data furnished in the paper on this point. With regard to the amount of ammonia in the air, it is so infinitesimally small in quantity, that it can only be estimated by the most modern and refined chemical operations, so that he was obliged to express some hesitation in accepting Mr. Smee's statements on this point. With regard to Mr. Smee's analysis of pseudo-bulbs and of flowers, Prof. Church observed that they agreed fairly well with average results hitherto obtained from terrestrial and epiphytic plants, but he thought that the percentage of undetermined ash constituents—viz., about one-half, was far too great, and he questioned the presence of aluminium, observing that though

terrestrial species of *Lycopodium* contain much of this metal, epiphytic species of the same genus contain none. He felt sure that some ingredient was wanting which had not been determined. With regard to floral colouring matters, Mr. Smee did not appear to have consulted recent researches. Professor Church had proved that a number of reds, blues, and purples, though called by different names—e.g., cochin in the *Coleus*, erythrophyl in Copper Beech, fruits, &c., anilin in black Grapes and anthocyan in were absolutely the same thing, being represented by the formula C₁₅H₁₁O₆. These became purplish in neutral cells, blue in alkaline, and red in acid cells. Even the blue-green of a certain *Ixia* was due to an alkaline solution of the same substance. With regard to the Beetroot, however, and plants allied to it, as the *Amaranthus* and *Buckwheat*, he found that the red-purple was of a different nature, and he had called it "amaranthin." It gave neither a scarlet nor blue reaction, neither green nor yellow with acids, but Prof. Church had as yet not determined its actual chemical composition, although he had found it to differ from anthocyanin by its insolubility in absolute alcohol, and by the absence from its spectrum of definite absorption bands. With regard to nutritive solutions, Professor Church thought that the ordinary solutions for plant-culture containing phosphates and salts of lime should be used for *Orchids*, not the solution surcharged with nitrogen compounds recommended by Mr. Smee. He would suggest spraying with "pulverised" solutions the epiphytic *Orchids*, for he had proved with *Echeverias*—as Boussegault had also long ago with other plants—that salts if moist could be absorbed by the surface of the leaf, so that when a lithium salt was placed upon a lower leaf it was detected in others above. Dr. McNab had previously proved the transmission of lithium salts imbibed by the roots throughout the plant, following the suggestion of Prof. Church to use this salt. Mr. Veitch and Dr. Masters called attention to the practice carried out by amateur *Orchid* growers of scattering fragments of carbonate of ammonia (smelling salts), so that the vapour might be absorbed. Mr. Henslow suggested that it might be absorbed with the aid of vapour of water, as he had found by experiments that this can be absorbed by leaves.—(*Transpiration in a Saturated Atmosphere*, Journ. Linn. Soc., Bot., xliii., p. 308).

WOLVERHAMPTON FLORAL FÊTE.

JULY 13, 14, 15.—This fine exhibition loses none of its interest as the years roll on. It was held, as usual, in the spacious West Park, and, as is customary, several large tents were required to accommodate the exhibits. On this occasion, probably with a view to the convenience of the visitors in the event of rain, a covered way connected the whole of the tents, and so access could be had to all without any necessity for going out in the open air. The day was gloriously fine, and the company large. Unfortunately, Mr. W. A. GREEN, the acting Secretary from the first, was unable to be present through illness; but his duties were very ably undertaken by Mr. ALFRED OUTRAM, who chanced to be present in the town on the opening day.

The schedule of prizes is a very lengthy one, and some of the leading features only in the exhibition can be touched upon.

Roses.—Wolverhampton always has a good show of Roses, as good prizes are offered in several classes. The flowers were probably as good as those shown at the Crystal Palace; and, despite the hot weather, the colour of many of the crimson varieties was brilliant. There were four collections of seventy-two varieties, the handsome 1st prize going to Messrs. HARKNESS & SONS, nurserymen, Bedale, their leading flowers being Madame Cusin, Duc d'Orleans, Mrs. J. Laing, Duke of Wellington, Muriel Grahame, Mrs. W. J. Grant, Queen of Queens, Marie Baumann, Marchioness of Londonderry, Cleopatra, Maman Cochet, Fisher Holmes, Madame Delville, and Her Majesty; Mr. R. B. CANT, nurseryman, Colchester, was 2nd, his leading blooms being Ernest Metz, Comte Raimbaud, Jean Supert, Madame de Watteville, Alfred Colomb, The Bride, Horace Vernet, and J. S. Mill. These may be taken as representing the best varieties shown in the various classes.

With forty-eight varieties, Mr. B. R. CANT was 1st, and Messrs. HARKNESS & SONS 2nd; and these two occupied the same positions with trebles of twenty-four varieties.

There was a class for twenty-four varieties by exhibitors not showing in the preceding classes, and here Messrs. TOWNSEND & SON, Colchester, were 1st; and Mr. J. MATTOCK, Oxford, 2nd. The best twelve new varieties of 1894-95-96 came from Mr. B. R. CANT.

The best twelve blooms of any dark-coloured Rose were of Horace Vernet from Mr. B. R. CANT; Messrs. TOWNSEND & SON coming 2nd with A. K. Williams.

The best twelve blooms of a light Rose were those of Her Majesty, from Mr. B. R. CANT; Messrs. HARKNESS & SONS were 2nd, with Mrs. J. Laing.

Mr. B. R. CANT was 1st with twelve very fine blooms of Tea Roses, and Mr. J. MATTOCK 2nd.

The most decorative arrangement of Roses was furnished by Messrs. PERKINS & SONS. It consisted of bouquets, wreaths, sprays, &c., with vases of cut blooms, and boards of the same—a charming feature, as it occupied a large space of tabling; and Mr. J. MATTOCK was 2nd. In the amateurs' classes, the leading prizes were taken by the Rev. J. H. PEMBERTON, Havering-atte-Bower.

Plants.—Very few good greenhouse plants filled a space of

many of them attracted considerable attention. Mr. J. A. CYPHER, Cheltenham, had the best sixteen, including, of flowering subjects, *Statice profusa*, *Phenocoma proflera*, *Barnesii*, *Eriosea Parmenteriana*, *ventricosa*, and *Bothwelliana*, *Bougainvillea Cypheri*, with large rich mauve-coloured bracts, and almost yellow foliage, and *B. Sanderiana*; *Stephanotis floribunda*, *Ixora Williamsii*, and gigantic examples of *Kentia Forsteriana*, *Belmoreana*, and *australis*; *Latania borbonica*, two fine *Crotons*, &c. 2nd, Mr. W. VAUGHAN, Leamington.

Groups of plants covering a space of 450 square feet were very fine, and so elaborate as to defy description. Mr. CYPHER was 1st, with probably one of the best arrangements he has yet set up. Mr. W. FINCH was 2nd, and Mr. W. VAUGHAN 3rd. The 2nd prize group was also very fine. The best group of 400 square feet came from Mr. A. CRYER, gr. to J. A. KENDRICK, Esq., Birmingham, who followed upon much the same lines as Mr. CYPHER; Mr. R. SHARPE, gr. to H. LOVATT, Esq., Busbury, was 2nd.

Mr. CYPHER was the only exhibitor of eight *Orchids*, which were below the usual quality. Collections of six *Palms* were a fine feature.

Collections of six foliaged-plants were very fine, Mr. CYPHER taking the 1st prize with capital *Kentia australis*, *Latania borbonica*, three *Crotons*, and a *Dasyliroa*. Mr. VAUGHAN was 2nd.

Mr. SHARPE had the best six exotic Ferns, which included a fine *Gleichenia Mendellii*, *Todea superba*, *Trichomanes radicans*, and three others. Mr. J. P. McDONALD, gr. to G. H. KENDRICK, Esq., Birmingham, was 2nd.

There were several classes for specimen plants in the division for gentlemen's gardeners, who made, as usual, a good display; but tuberous-rooted *Begonias* somewhat disappointed expectations. A number of classes were also set apart for amateurs and cottagers, and in these the exhibits were generally of good quality.

Cut Flowers.—The general classes for these included stove and greenhouse cut flowers, *Pansies*, *laced Pinks*, *Carnations*, &c., in all of which there were good exhibits. The best twenty-four fancy *Pansies* came from Mr. M. CAMPBELL, Blantyre. Messrs. CAMPBELL, J. NADEN, Derby, and W. PEMBERTON, Walsall, were the principal prize-takers for *Pansies*, *Carnations*, and *Pinks*.

Floral decorations including bouquets, &c. in the exhibition, at which Messrs. PERKINS & SONS, Coventry, greatly distinguished themselves, taking most of the first prizes. Mr. M. JENKINSON, Newcastle, Staffordshire, was also a successful exhibitor. Mr. HENRY ECKFORD's special prizes for Sweet Peas brought many very pretty displays.

Fruit.—With the exception of the collections of nine dishes, fruit also fell below the usual average. Mr. J. H. GOODACRE, Elvaston Castle Gardens, Derby, had the best nine dishes, staging Black Hamburg and Muscat of Alexandria Grapes; Barrington and Violette Hative Peaches; Lord Napier and Violette Hative Nectarines; Queen Pine, &c. 2nd, Mr. T. HARRIS, gr. to Lady H. SOMERSET, Eastnor, Leicestershire; and 3rd, the veteran, Mr. T. BANNERMAN, Rugeley. Grapes scarcely cut-d for special mention Peaches and Nectarines were few. Strawberries were fairly plentiful, and in other classes the more hardy fruits were staged.

Vegetables.—The valuable special prizes offered by Messrs. BURTON & SONS, JAMES CARTER & CO., WEBB & SONS, W. B. BASON, T. B. DOBBIE & CO., and others brought some very good collections, the chief honours falling to the lot of Mr. C. J. WAITE, gr. to Col. TALBOT, Esher, who was in very fine form throughout. There were many classes for vegetables, but probably the date of the show was a little too early to have midland-grown specimens in their best character.

HONORARY EXHIBITS.

Of these there were a large number. Messrs. JAMES VETCH & SONS, Chelsea, had a group of plants of great interest and beauty; Mr. J. H. WHITE, nurseryman, Worcester, a large and varied collection of cut flowers; the same from Messrs. JONES & CO., Shrewsbury, who added a number of charming effects in floral decorations; Messrs. THOMSON & SONS, nurserymen, Birmingham, had cut flowers, also in great variety, with foliaged plants; Messrs. JARMAN & CO., Chard, cut flowers, including *Roses*, vegetables, &c.; Mr. HENRY ECKFORD, Wem, Salop, had fifty bunches of Sweet Peas; Messrs. HARRIS, florists, Tottenham, Ferns, &c.; Messrs. WEBB & SONS, Wordsley, Stourbridge, specialties in vegetables, cut flowers, &c. Messrs. W. & J. BIRKENHEAD, Sale, had an extensive and varied collection of hardy Ferns. Messrs. DICKSONS (Limited), Chester, a very fine bank of imposing bunches of cut flowers, including *Roses*. Mr. E. MORRELL, Shrewsbury, made a bright display with *Roses*, &c.; Mr. H. M. STEVENS, Birmingham, staged floral decorations; Mr. R. SYDENHAM, Birmingham, had pretty arrangements in metal for holding flowers; Messrs. W. CLIBB & SON, Altrincham, foliaged plants, cut flowers and sprays of *Violas*; Messrs. BARK & SON, Cove-at Garden, a huge bank of cut flowers; Mr. W. H. JONES, honey; Messrs. W. F. GUNN & CO., Birmingham, a collection of cut flowers; the same from Messrs. HARKNESS & SONS, Bedale, who, as usual, staged very fine bunches; Messrs. DOBBIE & CO., Rothsay and Orpington, had a large variety of Sweet Peas, *Violas*, *Dahlias*, *Polargiums*; Mr. M. CAMPBELL, Blantyre, *Violas* and *Pansies*; Mr. H. DEVERILL, Banbury, a fine collection of his specialties in vegetables; Messrs. W. B. ROWE & SON, Worcester, cut *Roses*, &c.; and Mr. R. LOWE, nurseryman, Wolverhampton, an extensive assortment of plants, cut flowers, &c. The quality and variety of these honorary exhibits added very much to the interest of the show.

WISBECH AND DISTRICT HORTICULTURAL.

JULY 14.—This society, which is largely managed by working men, held their summer show in a commodious tent erected in the grounds of Selwyn Hall, the weather being fine. Certain plant and cut bloom classes are open, and although these did not attract many plant growers, they brought excellent cut Roses from Peterborough and other places, so that these flowers formed one of the leading features of the show.

A very fine stand of thirty-six varieties gained for Messrs. G. & W. BUNCH, Peterborough, the 1st prize; Mr. R. H. BATH, Nurseryman, Wisbech, being 2nd. Messrs. G. & W. BUNCH were also let with twenty-four, twelve, and six varieties, staging admirable blooms in each class, and distinct from the foregoing; Mr. R. H. BATH was in each case 2nd.

Bunches of Sweet Peas were a pretty feature, the best twelve, from Mr. F. W. HILL, represented some of Eckford's best new varieties. It is necessary in a class of this kind not only that the bunch should be confined to a certain number of sprays, but also that a bunch be confined to one variety only. Quite a small bunch might, and often does, contain blooms of the finest quality. The sprays of blossom are nearly always shown in a too crowded state; still, Sweet Peas are seen at their best when exhibited in the manner adopted by Mr. Eckford. Another good feature was the collections of hardy bulbous and herbaceous perennials, which appear to be well grown in the locality; and there were some pretty floral decorations. Messrs. W. & J. BROWN, nurserymen, Stamford, taking the 1st prize, with an arrangement showing the various uses to which flowers could be put.

DEVON AND EXETER GARDENERS' ASSOCIATION.

JULY 14.—The summer outing of this Association was held on the above date, eighty persons participating, the destination being Mount Edgcumbe. Mr. Richards, gr. to the Earl of Mount Edgcumbe, conducted the visitors through the main avenue to the Orangery. The Orange-trees, sixty in number, stand in square tubs, and date from the time of Queen Elizabeth. There are many varieties, and the collection is in fine condition.

In the Italian garden were some fine half-hardy plants doing well. *Araucaria excelsa* (in tube) about 10 feet in height; *Alsophilla australis* 7 to 8 feet; *Abutilons* 18 to 20 feet. Leading to the French garden was an *Ilex* hedge of about 20 feet high, and a fine *Cedrus Deodara*, which were blown down by the blizzard of 1891. Both the hedge and the Cedar had been successfully set up again, and seemed little the worse for the ordeal. In this garden are some grand clumps of Bumbos, one of *Arundinaria nobilis* being 30 feet high. Here was a Holly, with a bole of 25 feet high up to the first branches, and having a girth of 6½ feet. An *Ilex* of about 90 feet high had a spread at top quite equal to its height; and a Cork Oak hard by measured 8 feet 4 inches round the trunk. There were a pair of *Chamaerops excelsa* of 10 to 25 feet, and a fine specimen of *Juniperus bermudiana* and *Cupressus torulosa*.

The next move was to the Picklecombe Fort, whence a fine view of Plymouth, Stonehouse, and Devonport, Drake's Island, the Breakwater, the estuary of the Tamar, and Dartmoor is obtained. Still ascending the slope, the Countess Caroline garden was reached, in which the *Metrosideros*, *Rhynchospermum*, *Eucalyptus*, and similar plants were flowering profusely. Amongst them was a *Benthamia fragifera*, about 30 feet, just going out of flower.

An inspection of the flower-beds surrounding the mansion, and a saunter down the drive, brought the visitors to Cremyl Ferry, where a special steamer took the party across to the Devonshire side of the Tamar, Mount Edgcumbe being in Cornwall. The party then proceeded to Devonport Dockyard, and after inspecting certain parts of the Dockyard, and the ships now building, adjournment was made to St. George's Hall, where luncheon was served, Mr. ANDREW HOPKINS occupying the chair.

NATIONAL ROSE.

JULY 15.—The Northern Show was held in conjunction with the Norfolk and Norwich Horticultural Society, in the grounds of Carrow Priory, Norwich, one of the seats of J. J. Colman, Esq. Some of the most notable exhibits were as follows:—

NURSERYMEN.

Roses.—Best thirty-six single trusses: 1st, Mr. B. R. CANT, Colchester, with grand specimens, of which the following varieties were particularly praiseworthy:—*Duchesse de Morny*, *Suzanne Marie Rodocanachi*, *Mrs. John Laing*, *Her Majesty*, *Muriel Grahame*, the beautiful sport from Catherine Mermet, *Ernest Metz*, *Helen Keller*, and *Madame Delville*. This prize carried with it the Jubilee Challenge Trophy and Gold Medal. Messrs. HARKNESS & SON, of Bedale, were 2nd, and secured the Silver Medal for the best H.P. in the show, with a glorious bloom of *Earl of Dufferin*.

Mr. B. R. CANT again took premier honours for seventy-two distinct single trusses, amongst which *Dr. Andry*, *Beauty of Waltham*, and *J. S. Mill*, were very fine. In the same class, the 2nd Award of Merit to Messrs. HARKNESS & SON, who included beautiful specimens of *Madame Hoste*, *Star of Waltham*, *Duc d'Orleans*, and *J. S. Mill*.

For thirty six distinct trebles, Mr. B. R. CANT added to his

former victories by again winning 1st prize with a beautiful collection of blooms. *Gustave Piganeau* was an ideal flower, and the following were remarkably fine:—*Marchioness of Downshire*, *Horace Vernet*, *Duchesse de Morny*, Messrs. J. Laing, A. K. Williams, Charles Lefebvre, Comte de Raimbaud, Countess of Oxford, *Marchioness of Londonderry*, *Marguerite de St. Amand*, and *Duke of Teck*.

The Yorkshire firm, Messrs. HARKNESS & SON, were again little behind Mr. Cant. They had fine flowers of *Duke of Fife*, *Duchesse de Morny*, and *Countess of Oxford*.

In the class for thirty-six distinct single trusses, there were seven entries. Messrs. PRIOR & SON, Colchester, carried off 1st honours with a good collection, amongst which the following were specially worthy of notice: *Maman Cochet*, *Madame de Watteville*, *Mrs. J. Laing*, and *Ernest Metz*.

Messrs. TOWNSEND & SONS, Worcester, were 2nd, having lovely blooms of *Suzanne-Marie Rodocanachi*, and *Gustave Piganeau*.

The best eighteen distinct trebles were from Messrs. PRIOR & SON, Colchester, who had well-finished flowers of *Mrs. John Laing*, *Marchioness of Londonderry*, and *Suzanne-Marie Rodocanachi*.

AMATEURS.

In the class for twenty-four distinct varieties, single trusses, the 1st prize, with Jubilee Trophy and Gold Medal, were won by Mr. E. B. LINDSELL, Bearton, Hitchin, Herts, who staged fine blooms of A. K. Williams, *Earl Dufferin*, *Merveille de Lyon*, *The Bride*, and *Marie Baumann*. The 2nd honours were awarded to the Rev. J. H. PEMBERTON, Havering-atte-Bower, for a very meritorious exhibit.

Mr. E. B. LINDSELL and the Rev. J. H. PEMBERTON were again 1st and 2nd respectively in a class for thirty-six distinct single trusses.

Eight distinct trebles made a very nice show, Mr. E. B. LINDSELL once more taking the lead, thus securing 1st prize in the three most important amateur classes.

A piece of plate presented by the Mayor of Norwich accompanied the 1st prize for eighteen distinct single trusses, which was won by Mr. O. G. ORPEN, Colchester, who showed a grand flower of *Muriel Grahame*, which was awarded the Silver Medal, as being the best Tea or Noisette shown by amateurs.

TEA AND NOISSETTE SECTION.

Nurserymen.—Messrs. FRANK CANT & Co. took 1st prize for eighteen distinct single trusses, with superb blooms of grand substance and colour, conspicuous amongst which were *Ernest Metz*, *Caroline Kuster*, and *Maman Cochet*. The 2nd prize was awarded to Mr. B. R. CANT, who had beautiful blooms of *The Bride*, *Muriel Grahame*, and *Maman Cochet*.

For twelve distinct single trusses, Mr. H. MERRYWEATHER, Southwell, Notts, was 1st, showing nice specimens of *Innocent Pirola*, *Maman Cochet*, *The Bride*, and especially a magnificent flower of *Niphetos*, which secured a Silver Medal as the best Tea or Noisette in the nurserymen's classes; Mr. GEORGE PRINCE, Oxford, was 2nd, and had good blooms of *Madame Margottin* and *Catherine Mermet*.

For twelve single trusses of *Her Majesty* (open), Messrs. PAUL & SON, Cheshunt, Mr. H. V. MACHIN, and Messrs. HARKNESS & SON, took honours in the above order.

Garden Roses.—These were the objects of much admiration. For twelve bunches, distinct, arranged in a space not to exceed 4 feet by 3 feet (amateurs), Mr. MACHIN was 1st, and Mr. ORPEN 2nd.

In the open class for eighteen bunches, Messrs. PAUL & SON, Cheshunt, were 1st; followed by Mr. TURNER, Slough.

The class for a display of Roses brought one of the most beautiful exhibits in the show, being the 1st prize display by Mr. PRINCE, the tasteful arrangement of which produced a charming effect.

NEW ROSES.

Amateurs.—The Rev. J. H. PEMBERTON was 1st for six new Roses, single trusses, showing *Ellen Drew*, *Clio*, *Madame Joseph Combert*, *Mrs. Sharman Crawford*, and *Helen Keller*.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 15.—Orchid flowers of fine quality are not plentiful at this season, and the exhibits on this occasion were limited in number. The following members of the committee were present:—*Samuel Gratrix*, West Point, Whalley Range, Chairman; and Messrs. W. A. Gent (Hon. Sec.), R. Johnson, D. B. Rapport, E. J. Sidebotham, Jas. Anderson, John Cowan, G. Law-Schofield, H. Greenwood, J. Backhouse, W. Bolton, and P. Weathers.

The following plants were inspected by the committee in the order in which we place them, namely, from Captain SCHOLEFIELD (gr., Mr. Schill), *Cypripedium Godefroyae leucochilum aureum* (Award of Merit), which has the ground-colour of C. canaliculatum with the spotting of C. Godefroyae—an acquisition to its class; *Cypripedium* called *Godefroyae leucochilum*, which appears to have some bellatulum blood in it, as is evident in the self-coloured lip, and the chestnut-coloured blotches on the white ground. A First-class Certificate was awarded the variety. Captain Scholefield showed also *Cypripedium* × *Meusuraea*-bellatulum × *Veitchi*, very distinct, showing traces of both parents, especially of C. Veitchi, a nice pleasing variety (Award of Merit).

W. A. GENT, Esq., Brooklands, showed a good *Cattleya Warscewiczii*, and an indifferent form of C. *Eldorado Wallisi* (not white in the segments).

Messrs. CHARLESWORTH & Co., Heston, Bradford, showed a well grown *Cattleya granulosa aurea* with four flowers (Award of Merit), the greenish tint pervading the yellow is no drawback to the flower, which is attractive when viewed at a distance. They also showed a form of *Braemvaia Lawrenceana* var. *longissima*, to which a Botanical Certificate was awarded, which was right enough, but the variety is a very ornamental plant, which only needs good culture to make it attractive. This firm showed other plants, the more prominent of these being a crossbred between C. Boxalli and C. *canthum superbum* called *Banfishall* (this is a little too much, Mr. Charlesworth—keep to Christian names). It is a finely coloured flower, not large, but pleasing in form and colouring (Award of Merit).

THOMAS STATTER, Esq., Stand Hall (gr., Mr. R. Johnson), showed a plant of *Cypripedium callosum* *Sanderus* with a magnificent flower thereon, which was undoubtedly the finest thing at the meeting, but the variety having been certificated before it could not be dealt with. Mr. Ball's flower, certificated at an earlier meeting, although not half the size of Mr. Statter's, was identical; and the one I described in these pages last year of Mr. Gratrix, was so near its fellows in question, that they all appear to have come from one and the same plant. Mr. STATTER also showed the new *Dendrobium*, *Victoria Regina* with a few flowers upon it, receiving an Award of Merit, which is quite as much as it is worth, for when the novelty wears off, a batch of the common noble will be as much or more prized. The colour of the limbs and the lip is half white and half corulean blue, smallish in size, and not remarkable in substance. It lacks the influence of some of the choicest East Indian *Dendrobies* to place it in the front rank. Like all these other side of the world species, with its nodes and wiry-like stems, the plant may possess longevity. This exhibitor had also a good *Cattleya eximia*.

D. B. RAPPART, Esq., The Promenade, Liscaud (gr., Mr. Nicholson), exhibited an interesting *Poliochryllum Collettii*, which received a Botanical Certificate. It forms a sort of circle, with its shaking filaments, and the colour will please those who favour curiosities in Orchids.

E. J. SIDEBOTHAM, Esq., Eritone (gr., Mr. G. Shiner), showed *Cypripedium Cioela*—one of the lightest forms of the *Selenipedium* section, which the committee requested inspection again when stronger; also a flower of a good form of *Cattleya Gaskelliana*, which possesses a pleasant fragrance.

Mr. ALLEN, Sale, sent a *Cattleya superba*, which received a Cultural Commendation.

Messrs. CHARLESWORTH & Co. exhibited a showy collection, consisting of some choice *Masdevallias* and seedling *Laelio-Cattleyas*.

THE PEOPLE'S PALACE HORTICULTURAL SUMMER SHOW.

JULY 15, 16, 17.—This was the second of four exhibitions of this society during the present year, and as compared with that held at the corresponding period in 1896, was decidedly in advance of it, thus showing there is a manifest improvement in the culture of plants in the East End of London. The exhibitors are grouped in two main divisions, viz., those living in the more crowded parts, such as Mile End, Stepney, Limehouse, Plaistow, Wapping, &c., which are known as congested districts, and those lying beyond these, which are more favourable to plant-culture; a group of classes being allotted to each.

The best ground group of plants in the open division came from Mr. E. J. PETHER, 99, Grove Road, Walthamstow, who has a small greenhouse in the back-garden; and that in the congested division from Mr. W. F. KEARNS, 105, Old Church Road, Stepney.

In the open division there was a class for a smaller group, the 1st prize going to Mr. A. J. FOSTER, 57, St. Donata's Road, New Cross. Among flowering plants there were fine specimens of *Fuchsias*, *Plumbago capensis*, *Nerium Oleander*, *Pelargoniums*, &c., and of foliage plants *Aspidistra*, *Ficus*, *Dracena*, *Coleus*, &c., some excellent Ferns being also staged, and capital Fern cases. The most conspicuous examples of plant culture were two large fan-shaped *Fuchsias*, 5 feet by 4 feet, grown by a dock labourer, who with his wife occupy a small room at 9, Court's Road, Burdett Road, E. One was very finely bloomed, the other coming into flower; foliage and flowers alike were admirable. These two plants greatly interested H. R. H. the Duchess of ALBANY, who opened the exhibition, and in each case they were awarded special extra prizes; one plant occupies each of the two small windows, and they have the greatest attention. The favourite hanging window plants are the blue and white *Campanula isophylla*; there were pretty baskets of mixed plants also. There were thirty-six classes in all, and only two or three failed to bring competitors.

Very fine non-competitive groups of plants were sent by His Grace the Duke of FIFE, President of the Society; His Grace the Duke of NORFOLK, Lord ROTHSCHILD, A. F. HILLS, Esq., Messrs. HOLMES, Frampton Park Nurseries, &c. Splendid Roses from Messrs. C. E. SHEA and T. B. HAYWOOD, those from the former particularly fine; the Hon. T. A. BRASSLEY, &c. A very fine collection of Malmalson Carnations from His Grace the Duke of WESTMINSTER; a series of very handsome floral arches, from Mr. J. R. CHARD, court florist, of Stoke Newington; sprays of *Violas* in great variety from Mr. W. BAXTER, florist, Woking, and others. Early in September there will be an exhibition of *Dahlia*s, this flower being largely grown in the East End.

NATIONAL VIOLA.

JULY 17.—The exhibition of Viola flowers during such weather as occurred in the South of England last week is apt to be attended with unsatisfactory results. The Viola is one of the least adapted of flowers to withstand continued hot sunshine in July; and even in shady borders, the plants become exhausted, and the leaves thin and small, and the flowers of diminished size and ephemeral existence. But when they have been cut and taken to an exhibition 400 miles distant, the effort to display themselves is feeble in the extreme. Then there are comparatively few persons (at any rate south of the Tweed) who take an interest in Violas for exhibition purposes; they share, in this respect, much the same fate as do Tulips. These circumstances are more than sufficient to explain the character of the second exhibition of the National Viola Society, held on Saturday last in the gardens of the Royal Botanic Society, Regent's Park. It would have been very insignificant in continental eyes as the product of a "National" Society, no doubt, but under the circumstances, nothing better could have been expected. Nevertheless, the Viola is a beautiful and very useful garden plant, especially in certain districts, and under favourable circumstances. It is in a dry season that the Viola is disappointing, and to provide against this the necessary measures are not within the possibilities of every gardener. We have seen the circumstances overcome, however, and in a garden within 8 miles of Whitehall. The principal means have been the removal of the naturally light soil, which has been replaced by good loam, and made rich enough to suit the Viola, and then, after planting, there has been unremitting care in watering and pegging, and, moreover, the plants have been sprayed each morning and evening. Given such treatment, Violas are capable of providing uncommon and very beautiful garden effects unassociated with any other plants. There was a trial of Violas last season under the auspices of this Society, and the varieties afterwards recommended for planting were given in the *Gardeners' Chronicle* for August 15, 1896. The value of a variety of Viola cannot be adjudged correctly unless its habit of growth be known.

OPEN CLASSES.

The best collection of forty-eight sprays of Violas, distinct, nine blooms in each spray, was shown by Mr. W. BAXTER, Woking, who won a Gold Medal. A collection from Scotland, shown by Messrs. JNO. FORBES, Hawick, being 2nd. It was a Scotch grower, however, who won the Gold Medal for a similar collection of Pansies, the 2nd prize going to Messrs. I. HOUSE & SON, Coombe Nursery, Bristol.

The 1st and 2nd prizes for twenty-four Fancy Pansies, distinct, went to Mr. M. CAMPBELL, Blantyre, N.B., and Mr. JNO. SMELLIE, Bushby Nurseries, N.B.; but in the class for twelve blooms, these two competitors occupied reverse positions.

Twelve blooms of the florists' Show Pansies were best from Mr. JNO. SMELLIE, and the same exhibitor won for twenty-four sprays of Violas, six blooms in each spray.

There were classes also for rayless varieties, and for miniature rayless flowers, also for yellow self and white self Violas. Messrs. I. HOUSE & SON won in the class last named, showing *Christiana*, *White Empress*, and *Countess of Hopetoun*.

A dinner-table decorated with Violas and their own foliage was shown in competition, but it was hardly noteworthy.

In a class for six Violas (tufted Pansies) in pots, of varieties to be selected from a given list, the 1st prize was won by Mr. D. B. CRANE, Highgate, N.; and having more control, perhaps, over such plants than those in a border, the quality of these was satisfactory, the growths being quite strong. Messrs. I. HOUSE & SON were 2nd.

Mr. L. BROWN won 1st prize in a class for three sprays of miniature rayless Violas, not to exceed 1½ inch; the varieties were *Blue Bell*, *Violetta*, and *Beale*.

Amateurs.—The number of competitors in these, as in the open classes, was small. Mr. JAS. MAXWELL, Dalton Newton, was 1st for twelve fancy Pansies and for six show Pansies; the best collection of twelve sprays of Violas being shown by Mr. R. T. DOUGALL, whose flowers deserve commendation, being bright and fresh-looking. Mr. JAS. MAXWELL was again 1st in the smaller class for six sprays.

Mr. D. B. CRANE had the best six sprays of rayless Violas, showing *Floral*, A. J. Rowberry, *Lord Witch*, *Nellie*, &c. Mr. CRANE was also 1st for three sprays of white self Violas, showing *Ethel Hancock*, *Nellie*, and *Christiana*. A spray each of the varieties *Duchess of Fife*, *White Duchess*, and *Goldsmith*, were from Mr. J. J. SHELFORD, South Woodford, Essex.

The Hon. Secretary to the Society (Mr. A. J. ROWBERRY) won 1st prize for a collection of eighteen varieties of Violas, six blooms of each, arranged in specimen-glasses, with 12 1/2 inch foliage. He was followed in this class by Dr. BRACKLETON.

Messrs. DOBBIE & Co., Rotheay, and Messrs. I. HOUSE & SON, made honorary exhibits of Viola and Pansy blo

NATIONAL CARNATION AND PICOTEE.

JULY 21.—From a spectacular point of view, the change of the site of this exhibition from the Crystal Palace to the Royal Botanic Society's Gardens, in the Regent's Park, scarcely proved satisfactory. The excessive heat of Saturday last led to the abandonment of the intention to hold the exhibition in the glass-covered annex, and the exhibits were placed on the turf banks under the large exhibition tent. Parched grass was scarcely an appropriate background to the flowers, and then they were below the eye, rendering an examination of the blooms, and the deciphering of the names, difficult. But, as Mr. Martin R. Smith remarked at the luncheon, the attendance of the public was a matter of small importance, the main thing being that the Carnation growers should have a chance of seeing what each grew, as if the takings at the gate are a matter of no consequence. That the Crystal Palace is the best place in which to hold such an exhibition, there can be no doubt; but if it is again held in the Regent's Park, it would be much better to exhibit the flowers in a tent erected on the lawn. The blooms of Carnations always look best when staged on tables covered with green baize or calico. While the exhibition, being so varied in character, was full of interest, yet in point of contrast with some which have preceded it, it was lacking in fine quality. Mr. Smith said truly that it is difficult to have the earlier-blooming bisarras and flakes in flower at the same time as the selfs and fancies, which are later in opening. There were some remarkably good blooms of bisarras and flakes in some of the stands, but many were small and rough. Southern flowers were past their best in not a few instances; but then, nobody can control the incidence of the season, and a date being fixed, the growers must do the best they can, and this they heartily attempted to do on this occasion. The light improved in the afternoon, and there was a good company.

Bisarras and flaked Carnations.—The fact that there were eight collections of twenty-four blooms in not fewer than twelve varieties, speaks volumes for the popularity of this class, and it was gratifying to witness the Royal Nursery, Slough, showing something of its old prowess. Mr. TURNER's leading flowers were S.B. Robert Houlgrave, P.P.B. Arline, S.F. Guardsman, P.F. Prince George of Wales, P.F. Charles Henwood, C.B. Thaddens, S.B. C. H. Herbert, P.F. Billy Henderson, S.F. Tom Pinley, S.B. Duke of York, and I.P.B. John Ball, several of these being in duplicate. 2nd, Mr. MARTIN ROWAN, Manor Road, Clapham, his leading blooms being S.B. Robert Houlgrave, R.F. Mrs. Rowan, C.B. J. S. Hedderly, P.F. George Melville, P.F. Gordon Lewis, S.B. Robert Lord, P.F. Geo. Douglas, S.B. Admiral Curzon, and S.F. Sportsman. Mr. J. DOUGLAS, Great Gearies, Ilford, wa

With twelve blooms, there were four competitors, Mr. C. PHILLIPS, Bracknell, Berks, taking the 1st prize, with S.F. Guardsman, C.B. Master Fred, R.F. Lady Mary Currie, C.B. Fred Phillips, S.B. George, P.F. Geo. Melville, S.F. J. P. Sharp, C.B. Geo. Rudd, C.B. J. S. Hedderly, S.B. C. H. Herbert, P.P.B. Sarah Payne, and S.B. Robert Lord. 2nd, Messrs. THOMSON & Co., nurserymen, Birmingham.

There were five collections of six blooms, Mr. A. R. BROWN, Handsworth, Birmingham, being 1st with R.F. Thalia, P.F. Geo. Melville, C.B. J. S. Hedderly, S.B. Alfred Hudson, S.F. Guardsman, and C.B. James Merryweather; 2nd, Mr. W. GARTON, Jun., Wools on.

Selfs.—The best twenty-four blooms came from Mr. M. R. SMITH, Hayes, Kent and represented his newest seedlings, such as *The Nalad*, Mrs. Prinsep, Maron, President and Boreas, Solon and *The Cadil*, yellow; Mrs. McRae and Boniface, scarlet; Endymion, very fine, and *Tragedians*, rose; *Elise*, pink; Her Grace and Purity, blue; *Platymon*, Helmsman, and Mrs. E. Hambro, white. Mr. C. TURNER was 2nd, having *Loveliness*, pink; *Iona*, white; and *King of Scarlets*, scarlet, as his best.

With twelve selfs, Mr. E. C. SHARPIN was 1st, chief among them *Nabob*, *Apricot*, *Ruby*, *ruby-purple*; *Sea Gull*, and Mrs. Colby Sharpin. 2nd, Mr. C. PHILLIPS, Bracknell, who had *Lord Wantage*, a fine yellow self; *Ladae*, *Felicity*, &c.

For Six Selfs.—Mr. S. A. MOUNT, Thames Ditton, 1st; Mr. A. R. BROWN, Birmingham, 2nd, with much more refined bloom.

Fancies.—These consisted largely of yellow-ground flowers and they were very good. Mr. C. TURNER was 1st with such fine varieties as *The Gift*, *May Queen*, *Virgo*, *George Cruickshank*, *Primrose League*, also *Duchess of Portland*, white with slight stripes of rosy red, and very pretty; and some seedlings. Mr. J. DOUGLAS was 2nd with *Carina* and *Haytle*, two very fine yellow grounds; and *Pelegia*, heliotrope flaked with scarlet. In the 12 varieties Mr. C. PHILLIPS was 1st and Mr. Geo. CHAUNY, 2nd. There were several stands of six Fancies each, the best coming from Mr. W. GARTON, Woolston, 1st, and Mr. A. GREENFIELD of Palton, 2nd.

Single blooms.—It will suffice if the names of the two leading varieties of each type of Carnations be given—S.B. Robert Houlgrave and Admiral Curzon; C.B. Master Fred and Skirving and Ellis Crossley, P.F. Melas, S.F. John Wormald and Beham and Thalia. Selfs, Guy; rose, *Loveliness*; Ian and Uncle Tom

ellow, *Lord Wantage*, and *Germania*; buff, Mrs. Colby Sharpin and *The Beau*. Fancies, *Broderick* and *Cecil Rhodes*.

Picotees, white grounds.—There were six collections of twenty-four blooms, Mr. C. TURNER being 1st with *Red edges*, *Brunette* and Mrs. Gordon; purple edges, *Mary*, *Clara Penson*, and *Muriel*; rose edges, *Favourite*, *Lady Emily*, *Van de Weyer*, *Little Phil*, and Mrs. Payne, these were the leading varieties, and duplicates were permitted to be shown. Mr. J. DOUGLAS 2nd with, among others, beautiful light rose-edged flowers named *Fortrose* and *Athens*.

Messrs. THOMSON & Co., Birmingham, had the best twelve varieties, which included the red-edged *Isabel Lakin* and *John Smith*; purple-edged Mrs. Anderson; rose-edged *Little Phil* and Mrs. Sharp; 2nd, Mr. Geo. CHAUNY, Oxford.

Mr. A. R. BROWN, Birmingham, had the best six varieties Mr. T. ANNETTS, Brill, being 2nd in this class.

Yellow-ground Picotees.—Mr. M. R. SMITH took the 1st prize for twelve blooms, his leading varieties being *Badminton*, *Doria*, *Voltaire*, *Mohican*, *Golden Eagle*, *His Excellency*, *Borderer*, and Mrs. Tremayne; Mr. J. DOUGLAS 2nd, with blooms distinct from the foregoing, viz., *Empress Eugénie*, *Xerxes*, *Hygeia*, and *Miss Violet Douglas*.

With six varieties, Mr. F. HOOPER, of Bath, was 1st, with *May Queen*, Mrs. Gooden, *Florie Henwood*, *Ladae*, Mrs. B. Sydenham, and a seedling; Mr. C. HARDEN was 2nd.

Picotees, Single Blooms.—The best H. Red E. were *Gany-me-le* and *Brunette*; L. Red E., Mrs. Gorton and *Acorn*; H.P.E., *Polly Brazil* and *Muriel*; L.P.E., *Summerdale* and *Ether*; H. Ro. E., *Lady Laura* and *Little Phil*; L. Ro. E., Mrs. Payne; H. Scarlet E., *Duchess of York* and Mrs. Sharpe; L.S.E., *Fortrose* and *Favourite*. *Yellow Grounds*, Mrs. Douglas and *Ladae*.

Premier Carnations and Picotees.—Bizarre Robert Houlgrave (M. Rowan); flaked *Matador* (J. Douglas). Self: Mrs. Prinsep, yellow (M. R. Smith); Fancy, *Badminton* (M. R. Smith). Picotees, heavy edge, *Duchess of York*, rose (C. Turner); light edge: *Fortrose* (J. Douglas).

Undressed flowers, and no cards.—The classes for these exhibits numbered seven, and they may be passed over; each bloom was arranged with a single spray of Carnation foliage, if these classes could be made to suggest something better than an ordinary button-hole, they might possess some educational value, but they do not. The class for six blooms for those who had never won a prize brought a large competition.

Prizes were offered for seedlings, but owing to the late hour at which judging commenced, it was difficult to gather up particulars of the awards. It was understood that a Certificate of Merit was awarded to Mr. J. DOUGLAS's fine light-rose-edge Picotee *Fortrose*. A number of seedlings were staged; and that one Certificate only was awarded shows they were, with this one exception, improvements upon existing varieties.

Plants in Pots.—The best collection of specimens in pots filling a space of 5½ feet, came from Mr. MARTIN R. SMITH. It included a very fine lot of superbly grown new varieties, having among them several very fine new yellow selfs. Mr. CHARLES TURNER was 2nd. The only group filling a space of 30 feet was staged by Mr. J. DOUGLAS, who was awarded the 1st prize.

Mr. M. R. SMITH had the best twelve specimens in pots, several of them new varieties, chief among them being *Lady Jane Grey* of a very pleasing tint of rosy-heliotrope. Other fine new varieties were also staged. There was a class for a single specimen also, the best appeared to be a bright red seedling from Mr. M. R. SMITH, having twenty-five expanded blossoms; Mr. C. TURNER coming next with *The Gift*, one of the best of the yellow grounds.

Table decorations.—These included a dinner-table arranged for twelve persons, the floral decorations to consist entirely of Carnations and Picotees. Three were arranged, Mr. C. BLICK taking the 1st prize, with most elaborate arrangements, consisting of a large centre and two end stands, with numerous small vases, &c., filled with blooms, appropriate foliage being employed. Mr. BLICK confined himself to soft tints in his flowers. Mr. W. GREEN, Jun., Harold Wood, was 2nd, the design and execution being similar, but not so lofty or so well finished. Mr. J. DOUGLAS had the best vase, very light and elegant; Mr. V. CHARRINGTON was 2nd. Spray and button holes were also shown, in most cases stiff and formal; at any rate, nothing fresh or novel was gleaned from these two classes.

The Martin Smith Prizes for flowers from the open borders were again offered. One was for the best bunch of a self-coloured variety, another was for six varieties of selfs, and another for nine bunches of flake, bizarre, or fancy Carnations. In looking carefully through the flowers sent in competition, they appeared to be somewhat ordinary varieties, and it would seem that anything does to put into a bunch, quality being a secondary consideration. The varieties shown on the first two occasions of the institution of these prizes were decidedly better than they have been of late, and deterioration rather than progress was the rule. The bunches were all staged low down, and in an indifferent light, and perhaps they were not seen to the best advantage.

Miscellaneous Exhibits included a table of handsome-leaved *Caladiums* and foliaged plants from Messrs. B. PREST & SONS, Lower Norwood, a table of very pretty *Arcadian*, *Victorian* and *Jubilee* designs in flowers; a very pleasing addition to the show from Mr. J. R. CHAND, Stoke Newington; collec-

tions of cut Carnations from Messrs. JAS. VEITCH & SONS, CHELSEA; W. CUTBUSH & SONS, Highgate, N.; M. E. F. HOPPER, nurseryman, Hoddesden; and Mr. JAMES DOUGLAS, Bookham; with bunches of Sweet Peas from Messrs. BARR & SONS.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr., for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, F.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 17, is furnished from the Meteorological Office:—

"The weather was, upon the whole, exceedingly fine and dry, the rainfall being confined almost exclusively to the extreme western and south-western parts of the kingdom, where showers fell during the latter half of the week. Fog and mist were, however, somewhat frequent on our west and south-west coasts.

"The temperature was slightly below the mean in 'England, N.E. and E.', and only just equal to it in 'Scotland, E.' In all other districts it was above the normal, the excess varying from 1° in the 'Midland Counties,' to 4° in Ireland, 'England, S.W.,' and the 'Channel Islands.' The highest readings occurred at various times in the different districts, but mostly during the latter half of the week, when the thermometer rose to 80° or more in all districts excepting 'England, N.E. and N.W.' and 'Ireland, S.,' and to 88° in 'England, S. and S.W.' At Shields and Spurn Head it did not get above 65°. The lowest readings were observed, as a rule, on the 11th or 12th, and were somewhat low for the time of year, the thermometer falling to 35° in 'Scotland, E. and W.,' and to 45° or less in all other districts excepting 'England, S.' and the 'Channel Islands.' The daily range was very large, especially at some of the inland stations in Scotland; at Braemar the mean daily range for the whole week amounted to over 32°, and at Lairg to very nearly 35°.

"The rainfall.—With the exception of some very local showers in the 'Midland Counties,' no rain was experienced in any of the Wheat-producing districts, or in 'Scotland, W.' and 'England, N.W.' In Ireland, however, as well as in 'England, S.W.' and the 'Channel Islands,' some showers were experienced towards the close of the week; but even in these districts the aggregate fall was very much less than the mean.

"The bright sunshine was considerably in excess of the mean, the percentage of the possible duration amounting to 65 or more in all districts excepting 'Ireland, S.' Over the west and south of England it ranged between 73 and 75."

NOTICES TO CORRESPONDENTS.

* * FRUIT CROPS OF THE YEAR.—The Report of the condition of the Fruit Crops will appear in our issue for July 31, and will be followed by remark upon the subject in the following issues.

BREEDING OF VINES IN HOT-WEATHER: J. Clayton. We shall be pleased to publish any notes on this subject with which you may favour us, which will doubtless catch "H. A. C.'s" eye.

CARNATIONS "RUNNING": Carnation. Too much manure in the soil, or excessive surface feeding (the plant not being a gross feeder) will cause the colours to become clouded or indistinct; moreover, the Carnation is very liable to "sport." Where run flowers abound it is certain that the soil is too good for them; but in a large collection even when grown in a suitable kind of soil, some varieties are sure to sport more or less, sporting being inherent in the florist's highly-bred strains.

CATTLEYA LABIATA GASKELLIANA: B. A. The purple markings on the petals of the plant may not appear when it flowers again. Such markings, however, are frequently more or less constant, and the most marked cases are usually associated with or caused by a disease of the plant.

CHRYSANTHEMUM DISEASED: Grower. The leaves are attacked by a fungus, *Cylindrosporium Chrysanthemi*. Spray with a solution of potassium sulphide, 1 oz. to 2 gallons of water will be strong enough for this fungus. G. M.

FUNGUS: A. D. W. *Dædalea quercina*, generally affecting old Oak stumps and logs, but also supposed to be parasitic on wounds on living trees of the Oak. Remove everything in the plantations which would serve as hosts, and destroy by burning all specimens of the fungus.

GARDEN PEAS: John Shaw. They are dead, but what has killed them is not evident. Search the soil for the larvae of the cockchafer, wireworm, daddy-long-legs, and various weevils. The mole cricket does mischief in this way at times.

GLOXINIA FLOWERS GOING OFF: J. W. Apparently entirely due to scalding. There is no trace of fungous disease. G. M.

IVY-LEAVED PELARGONIUM: L. L. Directly the inflorescence was lifted from the box the petals fell away completely. They are very bright in colour.

JAPANESE PLUMS: An Exhibitor. We are unable to tell you more about these Plums than appears on p. 190 in our issue for August 15 last. It is really a Plum, and must be shown as such.

MUSHROOM CULTIVATOR: Mushroom. Will our correspondent who wrote to us for information concerning the business of a Mushroom-grower, kindly send his full address? We having a communication from another person to send him.

MUSHROOMS: A. S. Norwich. This disease is not uncommon on Mushrooms, generally affecting an entire bed. The cap is puckered and distorted, as are also the gills. It is generally considered to be caused by a parasitic mould, but of this only the mycelium has been seen. Others of the same tribe, in an uncultivated state, are also attacked, and ultimately produce what is termed *Hypomyces*, which pervades the whole fungus, and develops fruit of both kinds—conidia and ascospores. M. C. C.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—W. Early. *Heuchera sanguinea*.—F. F. A form of *Dianthus Seguieri*.—Mr. K. Shortlands. *Stapelia cupularis*, see also p. 45.—E. P. W. 1. The male flowers of the common Hop (*Humulus Lupulus*).—2. *Colutea arborescens* (Bladder Senna).—3. *Spiraea Lindleyana*.—J. M. C. Wretched scraps, completely shrivelled when received. 1. *Tenacium scorodonia*; 3. *Lotus corniculatus*; 6. *Agrimonia eupatorium*; 7. *Stellaria Holostea*; 2, 4, and 5, not recognisable. Send better specimens.—N. Devon. *Philadelphus*, perhaps *P. coronarius*.—*Armitage Bros.* *Eryngium Oliverianum*.—W. P. Gunn. 1. *Koehleria cristata*; 2. *Phalaris arundinacea*; 3. *Agropyrum junceum*; 4. *Elymus arenarius*.

NEW YORK OR PHILADELPHIA: J. D. We cannot take the responsibility of advising you. You say you are sailing shortly. On arrival you will naturally make enquiries for yourself at the nurseries and newspaper offices.

RED SPIDER AND THRIPS ON FRUITING VINES: Constant Reader. Cut the ripe Grapes and store the bunches, each removed with 6 inches of the shoot on which it grew, in wine bottles filled with clean water, into which a bit of charcoal is dropped; then proceed to clear the foliage of the pests. As a beginning, vaporise the viney with XL All, following this up by syringing for a week or longer, keeping the viney cool and well aired by day and night. In the viney where unripe fruit is hanging, you must do what is possible by syringing the foliage with rain-water without wetting the bunches. It will not be prudent to fumigate or make use of an insecticide in this house. We have no experience of the effects of XL All on the fruit; but perhaps some of our correspondents who may notice this paragraph will kindly give you theirs in a future issue.

ROSE: W. W. The white form of *Rosa rugosa*. The red-flowered Rose in your garden is doubtless *R. rugosa* also. The hips of this species, which are usually numerous produced, have a very gay appearance, and they make a delicious preserve.

TOMATO DISEASED: J. D. Affected with common "spot," caused by the fungus *Cladosporium*. Remove and burn every fruit showing symptoms of attack.

TOMATO DISEASES: A Puzzled One. The Tomato is liable to attack from many species of fungus, and they vary according to the conditions under which the plants are grown, whether in houses, or out-of-doors. The injury to fruits is most often caused by *Cladosporium lycopersici*. The symptoms are black decayed spots upon the fruit, one of which will generally be found at the apex. The species of fungus connected with "black-spot" were illustrated and described in the *Gardeners' Chronicle*, November 12, 1881. *Cladosporium fulvum* attacks both leaves and fruits, but more frequently the leaves. It occurs in the form of brown, dusty patches on the lower surface of the leaf. In some bad cases, the plant when shaken will throw off a cloud of spores. See *Gardeners' Chronicle*, October 29, 1887. The Potato disease—*Peronospora infestans*—attacks Tomato-plants occasionally, but so far as our experience goes, in the open air only. Then there is the "sleepy disease," or *Fusarium Lycopersici*, one of the most deadly of all; and, until latterly, very infrequent in these islands, but which we fear is now spreading. The *Diplocadium* and *Fusarium* stages, as well as the resting-spores, were figured and described by Mr. Geo. Massee in the *Gardeners' Chronicle* for June 8, 1895. The above fungus diseases are the most common and disastrous, but there are many other fungi which occur with those mentioned, or separately. Careful spraying with weak Bordeaux Mixture or sulphide of potassium is a good means of prevention. Of course, it should not be done when the fruit is ripening. Remove all affected plants, and burn them if possible.

TOMATO LEAVES DISEASED: Vortex. A disease of the leaves, *Cladosporium fulvum*, described and figured in the *Gardeners' Chronicle*, vol. ii., 1887, p. 533. It may be kept in check and perhaps prevented by fungicides, such as Bordeaux Mixture and sulphide of potassium.

WHITE CLOVER: A. H. O.K. If you can bear with the unsightliness for a season or two, and you take means to encourage the grasses by applying liquid-manure and top dressings of loam and wood-ashes in the spring, sowing some fine grass seeds on the spots most covered with the Clover, the latter will gradually disappear, the grasses having smothered it out of existence. The Clover is usually sown with the grasses to maintain a green cover for the land, and as a protection to the roots of the grasses whilst these are young and have not spread. The variety to use in lawn mixtures is *Trifolium repens*, which is of dwarf growth. Of course, you could dig up the lawn in September and resow.

THE

Gardeners' Chronicle.

SATURDAY, JULY 31, 1897.

THE DISEASES OF PLANTS.

THROUGHOUT a long series of years the pages of the *Gardeners' Chronicle* have from time to time conveyed much information regarding the diseases and ills connected with plant life—and its work continues, for the foes still advance. Now-a-days, however, the prevention and remedy of disease come more to the front, and naturally this aspect appeals to the cultivator of plants. There has never been any lack of suggestions for the cure of disease in our gardens and plant-houses, yet within the last ten years or thereabouts, remedies may be said to have showered on us at all times and in all kinds of gardening periodicals, till one feels lost in the numbers, and when a pest appears amongst our plants it is difficult to know what to do.

The subject of diseases of plants is a wide one, too large to be successfully grasped, even after long experience, while in many points there is too much obscurity as to the cause of disease to allow of successful treatment or cure. From the multitude of diseases liable to appear amongst plants, two classes stand prominently forward: (1) those due to the action of parasitic plants, particularly Fungi; (2) those due to injurious animals, particularly Insects. The remaining diseases have their cause in adverse soil conditions, in mistakes of cultivation, in defects in the plants themselves, or in other causes at present difficult or impossible to make out. In the present series of papers it is proposed to deal with the first class of diseases only—with those caused by the action of injurious plant-organisms on such plants as are useful to the out-door or in-door gardener. Diseases of this class are sufficiently common and disastrous enough in their results to be only too familiar, and their importance needs no further emphasising than to recall the ravages of Potato Disease, Vine Mildew, Damping-off Fungus, and the Hollyhock Rust of former days, not to mention the thousand-and-one mildews, rusts, and blights of less consequence. The subject of fungi is, to the ordinary gardener or cultivator of plants, one fraught with many difficulties arising from the minute structure and complex life-history of these tiny organisms, and any text-books available tend to bring these very difficulties into prominence. This is no doubt necessary and valuable in its way, yet we believe that, as in a "first aid" ambulance training, it is possible by a few exact observations to know enough about a fungus-pest to understand how to proceed against it. We do not then propose to deal with the fungi themselves any more than is necessary to understand them, but refer the seeker after detail in this direction to the books, some of these are—*Diseases of Field and Garden Crops*, (1884) Worthington G. Smith; *Diseases of Plants*, Professor Marshall Ward; *Diseases of Trees*,

Translated from the German by Professor W. Somerville (Macmillan, 1895); *Diseases of Plants due to Cryptogamic Parasites*, Translated from the German by William G. Smith (Longmans, 1897).

For all kinds of plant-diseases the treatment is one of two kinds: (1) preventive, aimed at keeping the disease away altogether; (2) remedial, which aims at destroying the offence. To prevent disease is more truly the work of a gardener than to cure it, for, after all, his efforts towards remedy cannot go much beyond the stage of "first aid;" if more be needed, the specialist should be applied to. To keep one's plants free from disease requires more skill, foresight, and experience than to try remedies; it also demands great patience, for, as it were,

drum \times radico-vitellinum described in the *Gardeners' Chronicle*, July 10, 1897.

Although the seeds were produced by *Lælia purpurata*, the plant has the slender, reed-like, leafy, root-bearing stems of *Epidendrum radicans*, and the flowers are borne on a slender peduncle, the whole in the present instance being 14 inches in height. The plant has one perfect flower, and two abnormal ones, and therefore they do not all appear to possess but four segments as mentioned in the description of *E. \times radico-vitellinum*; there is therefore every reason to believe that when strong grown the flowers will be normal. The abnormal flower examined is very singular. The only organ which preserves its identity is the lip, which is attached to the column in the basal third of its length, and is free in the remaining portion. The other segments are an outer one, consisting of two sepals; another

FIG. 20.—VEITCH'S PERFECTION STRAWBERRY = WATERLOO \times BRITISH QUEEN.
(Shown by Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, at the Royal Horticultural Society Meeting, July 13, 1897.)

the results are negative, no disease appears; but, on the other hand, the value of the crop repays all the extra care in raising. William G. Smith, Edinburgh.

NEW OR NOTEWORTHY PLANTS.

EPILÆLIA \times RADICO-PURPURATA (*Epidendrum radicans* ♂, *Lælia purpurata* ♀), new gard. hyb.

THIS is another remarkable cross raised by Messrs. Jas. Veitch & Sons, Ltd., again indicating the strong individuality of *Epidendrum radicans* as shown in the illustration of *Epicattleya \times matutina*, in *Gardeners' Chronicle*, April 10, 1897 (to which it bears a resemblance in form, size and colour), and in *Epiden-*

formed of a sepal in the same plane as the two which are joined, and a petal twisted into the inner plane, the other imperfect petal being attached to one side of the column. The mingling of the segments seems to arise mainly from the conflict between the attached column of *E. radicans* and the free one of *L. purpurata*. The colour of the flower is rich orange-scarlet; the base and centre of the lip bright lemon-yellow, broadly margined with light reddish-purple. The flower is 2 inches across, sepals lanceolate, petals ovate and pointed, lip broadly ovate, the front lobe merely divided from the side lobes by an incision on either side, which scarcely discloses the separation; crest three raised yellow keels, the middle one the longest. Mr. Seden's record is: "Sown September, 1892; flowered July, 1897." James O'Brien. [A figure of this plant will shortly appear in these pages. Ed.]

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

Pot-Sea-berrries.—Let all the runners that proceed from the young plants be pinched off as soon as observed, and afford liquid-manure liberally at the roots almost daily. If a plant make more than one crown, rub off the weaker ones forthwith—one good, well-ripened crown being better than two or three small ones. In the absence of rain, the plants will be benefited by being syringed overhead with clean water every afternoon.

Watering Wall Trees at the Roots.—This is an important matter on all sunny aspects, otherwise vigorous growth and good crops of fruit cannot be looked for, and if occasionally liquid manure can be afforded, the result will be very satisfactory.

Training Young Shoots of Wall-trees.—The laying-in of young growths of Peach and Nectarine-trees with short pieces of twigs should be carried out at short intervals of time. All young shoots proceeding from the shoots of the current year should be cut back to the point of origin; the points of strong leading shoots should be pinched or cut back to a well-placed lateral, and thus give the weaker shoots a chance of gaining strength. Fig-trees require almost identical treatment to the Peach and Nectarine in this respect; and they require, if anything, rather more attention. The same may be said of the Morello Cherry, as regards the laying-in and tying-down of young shoots over bare ones of last year's growth, and the stubbing back of fore-right shoots. A watchful eye should be kept on trees of the Peach, Plum, and Morello and Sweet Cherry for aphids, and should a well-directed spray of clean water delivered from the garden-engine not succeed in dislodging the pests, the usual remedy should be applied, namely, some good insecticide used in the proper proportions, applying the mixture after the sun has gone off the trees, and syringing the latter early the following morning with clean water.

THE KITCHEN GARDEN.

By W. POWE, Gardener, Highclere Castle, Newbury.

Onions.—Onions sown last autumn will now have attained their full size, and should be pulled up and laid in the sun to dry thoroughly before taking them under cover. When sufficiently harvested, the best and soundest bulbs may be tied in bunches, and hung to the walls or rafters in a cool, airy shed, for use as required through the autumn, and the badly ripened or split specimens used up at once. Give attention to the spring-sown crops, keeping the ground free from weeds. Should mildew appear on these, dust the plants with quicklime two or three times in the early morning, at intervals of a week. If growth be prematurely stopped by this pest, the bulbs will not keep through the winter. As soon as the crop of pickling Onions has done growing, pull them up, and let them lie for a few days in the sun, turning them over daily; then remove to a dry, airy shed or room till wanted for use. The Silver-skin type, which is the best for this purpose, should be utilised as soon as possible after maturation, as they quickly deteriorate in appearance and quality.

Winter Turnips.—A large sowing should now be made of these on ground from which the early Potatoes have been lifted, merely levelling it without further digging. A good hardy winter variety is Chirk Castle blackstone, but it being one that requires a long season of growth, the seed should be got into the ground as soon as possible after this date. Although this has a black and rather uninviting exterior, the flesh is pure white and the quality is excellent. The Red Globe is also an excellent variety, hardy, and of good size; whilst if yellow Turnips are liked, Orange-jelly should be chosen. Turnip-seed should be sown thinly in drills 15 to 18 inches asunder, and the plants thinned freely as soon as large enough to handle, 9 to 12 in. being allowed from plant to plant. If those from earlier sowings are coming too quickly into use, a quantity of the bulbs may be pulled when large enough, and stored in a cool dark shed, where they will probably keep in good condition for some weeks.

Globe Artichokes.—When the best heads have been cut from these, the flower-stems and dead or decaying leaves should be removed, and a mulching of rich manure applied, followed by a heavy watering. These proceedings will result in the production of another

crop of young heads. Where, however, a new plantation is made every year in the spring, which is an advisable practice, these young plants form a succession to the older plants, good heads in quantity being generally produced by them till the plants are cut off by frost.

Carrots.—If seed of the Early Horn Carrot be sown at about this date on a warm border, a supply of tender roots will be afforded till the middle of the winter, if some slight protection against severe frost be afforded the tops.

PLANTS UNDER GLASS.

By G. H. MAYCOCK, Gardener, Luton Hoo Park, Luton.

Chrysanthemums.—These plants, if in pots plunged in coal-ashes, should be examined as to the state of the soil in regard to moisture twice or thrice daily, and liquid-manure afforded twice a week, which may consist of weak farmyard manure-water and clear soot-water, given alternately. Secure the points of the shoots to the stakes, and remove laterals with the thumb and finger before they get long, not allowing these to get strong before nipping them off. If any roots are exposed, afford a light top dressing, pressing it down firmly with a blunt rammer; carefully remove suckers with as little interference with the roots as possible, not using a knife for this purpose. Earwigs must be sought for night and morning, as these insects do much harm by eating off the tips of the young growths and the buds. They may be trapped in small inverted pots half filled with hay, paper, or moss, placed at intervals along the rows of plants; or 9 inch lengths of Broad Bean-stems pushed in between the plant and the stake in a slanting direction. Green and black Aphides are troublesome at this season, and should be killed with tobacco-powder, or a solution of quassia chips as previously advised.

Violets.—Those intended to flower in frames during the winter are apt to become a prey to red-spider, which, however, may be kept in check by frequently syringing the foliage with the garden-engine, and if this be not sufficient, an insecticide must be used in the water. Keep the ground stirred and free from weeds, remove all runners from the plants, and keep the bed moist, affording the soil a good mulch of spent Mushroom-bed dung.

Plumbago rosea, if thoroughly established in the flowering-pots, will require to be removed to a cold-frame in a sunny spot, but on no account must the plants be allowed to become dry at the roots, or the bottom foliage will turn of a yellow colour.

Thysacanthus rutilans.—This is a plant not so often seen now as formerly; it should be treated like the above, only that this plant prefers a moist, cool bottom in summer, and should, therefore, be plunged in a cool moisture-holding material if the bottom drainage will allow the water to pass away freely.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Barford, Dorking.

Dendrobiums.—The species, *D. Phalaenopsis*, *D. lineale*, *D. bigibbum*, *D. stratiotes*, *D. superbiens*, *D. Goldianum*, *D. Bensoniae*, *D. secundum*, and *D. streblceras* should at this season be growing freely at the top and at the root, and therefore require the greatest amount of light, heat, ventilation, and moisture. In affording water at the root, which should not be done till the compost has become dry, it should be made moist throughout, established plants being afforded water several times to ensure perfect saturation of the material. The best time to afford water is previous to closing the house in the afternoon; and when the ventilators have been closed, let the plants have a good overhead syringing, and at the same time damp the pots, stages, floors, &c. Having done this, pull up the blinds and allow the warmth from sunheat to run up to 100°—even 110° will do no harm. The hot-water pipes may be used to preserve a warmth of about 70° at night; and early in the morning a small opening for the admission of fresh air should be made at the top of the house, the amount of air admitted being increased as the day advances. The species named delight in sunshine, and even in houses having a southern aspect it will not be necessary to afford shade before 10.30 A.M. As a general rule to be observed while the blinds are drawn down, the ventilation should be slightly reduced in amount. At about 2.30 P.M. the shading may be removed, and for half-an-hour after the blinds are pulled up, air should be admitted freely till closing time. For the destruction of the black thrips

that infest *Dendrobies* in sunny houses, examine the plants every day, killing the insects and sponging off their eggs with tepid rain-water. This work of course takes time, but it is better than to have the leaves of the young growths disfigured. For killing the yellow thrips, the XL All vapour is suitable.

Schomburgkias require similar cultural treatment to the *Dendrobies* above-mentioned, especially in the matter of sunshine. *Schomburgkia tibicinis*, *S. Kimballiana*, *S. Humboldtii*, and *S. Sanderiana* now commencing to grow, should be afforded fresh material at the root if the old is getting much decayed or sour. They are plants which do not require much compost, and it should be made of peat and sphagnum-moss resting on a large quantity of clean crocks. The plants thrive either in pots or baskets, if these are brought up close to the roof glass in the lightest position. *Schomburgkia crispata*, *S. Lyonsii*, *S. undulata*, and *S. gloriosa* are of taller growth, and quite distinct in habit from the foregoing; but they require, nevertheless, the same kind of treatment. At this date their growths will be advanced, and no disturbance of the plants should take place.

Cattleya Eldorado and its varieties, *splendens*, *crocata*, and *Wallisii*, are now in bloom, requiring much care to be observed in affording water, as too much in the air or at the root at this period would cause the succulent growths to turn black, and might involve the loss of the plant. Still, the plants must not be kept dry at the root, or the pseudo-bulbs would shrivel, but they should be afforded enough water to keep the compost in a slightly moist state, and much less moist when the blooms have been removed. When growth is finished stand the plants in the coolest part of the Cattleya-house, where, if afforded full light and sufficient ventilation, they soon mature. In a few weeks time, roots will push in quantity from the base of the flowering pseudo-bulb, and from the old roots; making this a suitable time to repot any of the plants that may require this sort of attention. *Laelia pumila* and its varieties *praestans* and *Dayana*, also *Cattleya marginata*, possess beautiful flowers, and some of these plants beginning to grow anew, it is advisable to place them in a house with an intermediate temperature, and to afford them abundance of water at the root till the flowers open. Hang them from the roof in a rather shady position; and examine them frequently for a species of white scale, which infests them, doing much harm.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Ledbury.

Strawberries.—Plants that were layered early will now be ready to remove from the beds. If they were layered in small pots the repotting should proceed without delay, well soaking the small balls if at all dry, for if potted with the soil in a dry state, they will never go away properly. Keep the crowns rather high when potting, and ram the soil firmly, leaving sufficient space for water. Stand the plants in a shady place for a day or two, then remove them to a piece of ground in full sunlight, or to the sides of the kitchen-garden walks, or wherever convenient. If placed on the soil, put an inch or two of coal-ashes beneath the pots so that worms may be kept out of them. Syringe the foliage twice daily; keep the side crowns rubbed out, as one good strong spike of flower is worth three weak ones. Where plants were layered into the fruiting-pots, they should be removed to their summer quarters at once.

Orchard-house.—The fruits in this house will now be ripening, and the syringing of the trees should consequently cease, and ventilation be freely afforded, keeping the atmosphere rather drier than heretofore. As soon as the fruits are cleared from a potted tree, remove it to the open air. Keep strong or lateral growth in bounds by pinching the points, and syringe the trees in the evening in order to keep the foliage clean.

Figs.—The trees in the early-house will now be affording a second crop of fruit, and when this crop is gathered, the house should be thrown wide open, as a means of ensuring sturdy, well-ripened shoots. Trees in later houses from which the first crop is gathered and the young fruits thinned a little, may be kept closer and warmer to enable the second crop to develop, affording the trees liberal applications of warm liquid-manure. The fruits in late houses now commencing to ripen, will require that the air be kept drier, and more air afforded. When gathering Figs, always use a sharp knife to sever the root-stalk, otherwise this is liable to be left on the tree.

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS, JULY, 1897.]

The words "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.

The counties are arranged in numbered groups, to correspond with those adopted in the Weather Reports of the Meteorological Department, and followed in our weekly Weather Tables.

* * Fuller comments will be given in the following numbers. See also Leading Article on page 70.

THE GHENT QUINQUENNIAL.—In addition to the prizes mentioned in the programme recently distributed, it is now announced that the Count DE GERMINY has offered a prize of 500 francs for a collection of 100 exotic Orchids, comprising the species and varieties of the greatest importance from a horticultural point of view. In memory of the late Count CHARLES DE KERCHOVE DE DENTERGHEM, formerly President of the Society, a prize is offered for the most remarkable collection of 100 annual or biennial hardy or greenhouse plants in flower. M. K. FIERENS, 135, Coupure, Ghent, is the Secretary, to whom letters of enquiry should be addressed.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The monthly meeting of this Society was held at 25, Westgate Road, on Tuesday last. Mr. JOHN BULLOCK occupied the chair. Mr. JAMES JEFFREY, of Oakwood, read a very instructive paper on the "Cultivation of the Carnation." Confining his remarks entirely to indoor culture, Mr. JEFFREY dealt with this most popular subject in a very practical manner. An excellent discussion followed, in which most of the members took part.

ISLE OF WIGHT.—The Horticultural Exhibition, held in connection with the Isle of Wight Agricultural Society, was held at Ryde on Wednesday and Thursday, July 21 and 22. Both days were showery,

TOTTENHAM AND EDMONTON CHRYSANTHEMUM SOCIETY.—The annual outing of the members of the Tottenham and Edmonton Chrysanthemum Society and their friends took place on Tuesday last week, when, by the kind permission of the Marquis of SALISBURY, upwards of sixty journeyed by brake or train to the grounds of Hatfield Park, which, together with the house, was thrown open for the inspection of the visitors.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY FLORAL COMMITTEE.—At the meeting on July 10, 1897, the Committee awarded First-class Certificates to Mr. C. G. Tubergen, jun., of Haarlem, for *Calochortus clavatus*; to the Gardening School of

Joh. van den Berg & Son, of Amsterdam, for *Russelia juncea*. Botanical Certificates to Messrs. de Graaff Bros., of Leiden, for *Conanthera bifolia* and *Gladiolus quadrangularis*. Votes of Thanks to the Gardening School of Frederiksoord, for *Antirrhinum majus écarlate vif*; to Mrs. J. H. Schöber, of Putten, for *Bifrenaria aurantiaca*; to Mr. C. W. R. Scholten, jun., of Amsterdam, for *Cattleya Eldorado alba*; to Mr. J. G. Ballego, of Leiden, for *Vanda Denisoniana*; to Messrs. Joh. van den Berg & Son, of Amsterdam, for *Vincetoxicum rosea*. H. C. Zwart, the General Secretary, Amsterdam, July, 1897.

IMPORTATIONS OF FOREIGN FRUIT.—At the "Lord Mayor's Feast" last November, certain high-class and scarce fruits graced the principal table. So

FIG. 21.—SOUVENIR DE LA MALMAISON CARNATIONS AT DOVER HOUSE, ROEHAMPTON. (SEE P. 72.)

which materially affected the attendance and the pleasure of the visitors. The exhibits were not so many as last year, but they were of average quality. One of the chief features of the show was the table decorations, which were very good, and had many mirrors. Mr. J. O. BROOK staged excellent Pompon dahlias. The other principal exhibitors were Messrs. RIST, KENT, PINCE, LEAK, and GOBLE; the latter received the Isle of Wight Horticultural Improvement Association Certificate for Cultural Merit, for blooms Carnations.

THE MIDLAND CARNATION AND PICOTEE SHOW will be held at Edgbaston Botanical Gardens on August 5 and 6, as originally fixed, and not as stated in your last issue. Your prompt correction will be much obliged, Robt. Sydenham.

Frederiksoord, for *Chrysanthemum maximum* Perfection, and *Centaurea macrocephala*; to Messrs. Gratama Bros., of Hoozeveen, for *Rosa x bifera* Capt. Hayward; to Mr. G. A. van Rossem, of Naarden, for *Rosa indica* nois. Madame Pierre Cochet; to Mr. Jac. Smits, of Naarden, for *Rosa indica* nois. Madame Pierre Cochet, *Rosa François Dubreuil*, *Rosa Mrs. R. G. Sharman Crawford*, and *Rosa Souvenir de Catherine Guillot*. Certificates of Merit to Messrs. de Graaff Bros., of Leiden, and to Messrs. E. H. Krelage & Son, of Haarlem, for *Astilbe Lemoinei* Gerbe d'Argent, A. L. Panache, and A. L. Plumet neigeux; to the Gardening School of Frederiksoord, for *Begonia versallensis* and *Myosotis palustris* Nixen Auge; to Mr. H. D. Willink van Collen, of Breukelen, for *Centaurea babylonica*; to the Botanical Garden of Groningen, for *Cirsium Velenowskyi*; to Messrs.

highly spoken of were these far-eastern products, that it was proposed to extend their importation into this country; but as time went on the project died out, and though probably isolated specimens of these fruits will doubtless again be seen at City and other feasts, they will continue to be "fruits to be desired." But now the Board of Trade has established a committee to inquire into the "what" and "how" relating to foreign imports and exports coming under the notice of our Consular agents abroad and Chambers of Commerce, we venture to suggest that for the wealthy at home there are many fruits abroad inviting the kindly offices of the importer and salesman, to which the attention of the Fruit Committee of the Royal Horticultural Society might profitably be directed. It would be an easy matter to get into touch with the officials of the Board, and it might be

found profitable for that committee to invite the attention of the fruit trade, here and elsewhere, to the desirability of, at any rate, ventilating the subject of encouraging the importation of foreign fruits now notable by their absence from the British table. It may be suggested that such an enquiry will cost but little, and that results might be profitable all round. However, we have thought it our duty to give the subject prominence in our columns, and will be glad to report such results as may be achieved.

"THE A. B. C. OF ROSE CULTURE."—This little brochure is by Mr. EDWARD MAWLEY, the well-known secretary of the National Rose Society (S. P. C. K., Northumberland Avenue, W.C.), and is one of a series of "Helpful Hints for Hard Times," each published at the same low price, and devoted to the practice of horticulture. It is not only from a pecuniary point of view that the Rose-grower need be interested in these hints, which are quite as applicable to amateurs, whose reward is in the health and beauty of their plants. The instructions are clearly and plainly given, serving either as an introduction to the novice, or a handy epitome for the more experienced grower. The author begins with the work of the first year, in preparing and planting; proceeds to make mention of the best varieties, and gives instructions how to protect, prune, and otherwise manage them, both when newly set, and in subsequent seasons. All this information is classified well, and is reliable, and the little book should have many admirers.

"WORN OUT."—Mr. HENRY STEVENS, so favourably known by his fine photographs of Orchids, has extended the scope of his photographic labours, and, as we noted at the time, succeeded in obtaining the first position, among many thousands, in a competition initiated by the *Graphic*. His picture "Worn out" is almost painfully realistic; but as a photograph it surpasses anything we have seen. Copies have been accepted by the QUEEN and PRINCESS OF WALES, and exquisite photogravure reproductions can be purchased either on India-paper or as ordinary prints from Mr. STEVENS, King Street, Covent Garden.

"RAY LANKESTER."—Mr. E. J. LOWE obligingly sends flowers of a herbaceous Chrysanthemum thus named, and which was raised between the common or Eye Daisy, Chrysanthemum Leucanthemum, and C. atratum. The flower-heads are larger than in either parent, and there is a double row of ray-florets, each ray being more or less completely divided into its component parts; the ray-florets, in fact, are more or less lacinated. Judging from the flower sent us, the hybrid would be a valuable addition to the flower-border. Lacination, or rather partial separation of the petals, is not of very rare occurrence in Chrysanthemums, or, indeed, in Composites generally. It is interesting to see that it is brought about by hybridisation.

ROYAL APPOINTMENT.—Mr. HENRY GEORGE SMYTH, of Goldsmith Street, Drury Lane, has been appointed by royal warrant horticultural sundriesman to Her Majesty. This, we believe, is the first appointment of the kind which has been made.

"ILLUSTRATED FLORA OF THE NORTHERN UNITED STATES, CANADA, ETC."—The second volume of this useful book has lately been issued. It is published in New York by CHARLES SCRIBNER'S SONS, and may be had of any foreign bookseller. Those concerned with hardy herbaceous plants will find the book of great use to them, as in addition to authentic descriptions, there are small woodcut illustrations. The arrangement of the orders is unfamiliar to British botanists, but is one that is gaining ground. In any case, the carefully-prepared index obviates any inconvenience from unfamiliar arrangement or even vagaries of nomenclature.

THE PHIPPS CONSERVATORY, SCHENLEY PARK, PITTSBURG.—The *Home Messenger*, an American publication, in its number for May gives an account, accompanied by illustrations, of what are stated to be "The most elegant, spacious and substantial systems of pleasure greenhouses in the New

World." They have been presented to the City of Pittsburg by Mr. HENRY PHIPPS, and constitute "the most princely donation of the kind ever made to any city in any country." The illustrations suffice to show that the houses are well filled with plants of many kinds, to all appearance excellently cultivated. These famous conservatories are open to the public without cost throughout the year, and are under the direction of an old acquaintance, Mr. WILLIAM FALCONER, formerly on the staff of the *Garden*.

CRICKET AT CHISWICK.—An interesting cricket match was played on the Front Common, Turnham Green, on Wednesday afternoon last, between gardeners (in high hats!) and the Post Office employees at Chiswick. The gardeners won on the first inning. Messrs. MEARS and GREENHAM played well for the latter, whilst Messrs. E. H. BARRY and BALL did their best for the "men of letters."

PUBLICATIONS RECEIVED.—*Connecticut Agricultural Experiment Station*. A bulky volume, descriptive of work done and successes achieved during 1896.—*The Agricultural Gazette of New South Wales*, January to November, 1896; contents and index.—*Agricultural Journal, Cape of Good Hope*. The issue for June 10 is devoted, as usual, to appropriate matter concerning cattle and crops.—*Monsonia*. A pamphlet reprinted from a May number of the previously-named journal, and describing the nature and history of *Monsonia ovata* (Geraniaceae), and its uses and value as a remedy for dysentery.—*Proceedings of the American Academy of Arts and Sciences*, June, 1897. This pamphlet, devoted to contributions from the Gray Herbarium of Harvard University, deals with—I. Revision of Mexican and Central American species of *Houstonia*; II. Key to Mexican species of *Liatrum*; and III. Descriptions of new or little-known plants from Mexico.—*Botanical Magazine (Tokyo)* for May 20 includes, Note on the Cocoon Fungus, List of Japanese Hepaticae determined by Mr. F. STEPHANI, of Leipzig, and various articles in Japanese.—*Annales Agronomiques*, June 25.—*Journal of the Board of Agriculture* (Vol. iv., No. 1), containing articles on Green Manuring, the Lapwing, Imports of Dairy Produce, Ensilage of Potatoes, Injurious Insects and Fungi, and various notes and reports.—*Select Catalogue of Horticultural Books* (Delamare Printing and Publishing Co., New York). A very useful list of books and magazines of general and special horticultural interest, published in America or England, and obtainable through the above-mentioned firm.—*New York Experiment Station*. We have received a series of Bulletins from this Institution, and note that most of them can be had either in a complete, or in an abridged or "popular" form. The following subjects are treated of:—No. 119, Downy Mildew of the Cucumber and its treatment; No. 120, Spray-pumps and Spraying; No. 122, A Peculiar Insect-enemy of the Apple; No. 123, Spraying Potatoes in Long Island in 1896; No. 124, Anthracnose of the Black-Raspberry.—*Meehans' Monthly*, July.—*Prunes in Oregon*, Bulletin No. 45, for June from the Oregon Agricultural Experiment Station.—*Orchidacearum genera et species*, exposuit FRITZ KRAENZLIN, vol. i., Fasc. i. Berlin.—*The Orchid Hybrids* (2nd supplement) Berkeley, Cal. By GEO. HANSEN.—From the Journal of the Royal Meteorological Society: *Shade Temperature and Report on the Phenological Observations for 1896*, both by EDWARD MAWLEY, F.R.H.S. President.—*Notes from the Botanical School of Trinity College, Dublin*, May, 1897. This includes: The Role of Osmosis in Transpiration, Osmotic Pressure in the cells of leaves, Physics of the Transpiration Current, and Herbarium Notes.—*Journal de la Société Nationale d'Horticulture de France*, June, 1897.

NOTES FROM DOVER HOUSE GARDENS.

THE recent exhibits of plants of Malmesbury Carnations shown at Richmond, and at the Drill Hall, from these gardens (see fig. 21, p. 71), evidenced that Mr.

McLeod can grow them as well as anyone else, if not a little better. Seldom before have I seen such fine plants so rudely robust, and carrying so many fine flowers. The plants shown seem to have been but one-third of the number grown, all of which are very fine. The best of the group are but twenty-two months from the potting of the layers, which took place in October, 1895. They are now in 9-inch pots, and in these will remain to bloom next year, getting in the meantime a top-dressing, and when the flower-buds appear, a little feeding. The nature of the compost seems to be of primary importance, for this consists of two parts loam of the best quality, and one of fibrous peat, very little manure being used; but some woodashes and screened lime rubbish is well mixed in. A very important feature consists in the winter treatment, when the roots and plants are kept rather dry—indeed, every effort is made to prevent moisture from coming into contact with the foliage. It has been well said that Malmesbury Carnations, owing to the soft sappy nature of the wood and leafage, need during the resting period something of Cactus treatment. In any case a dry cool atmosphere, with plenty of air in fine weather, has proved to be the best management at Dover House. Very many of these fine plants having carried from thirty to forty blooms this season will produce fifty next year, growths having been thinned down to that number. Both the flesh-tinted and the pink varieties are grown, the latter in much the greater degree, as it is most in favour.

It was Mr. McLeod's fortune, because of the great pressure arising from the Jubilee celebrations, to be compelled to leave behind the usual plants for making his customary mixed group at Richmond, and in place thereof to take about thirty of his Carnations. Not anticipating so high an honour, he was much gratified to find that the splendid special Silver-gilt Jubilee Medal was awarded to his Carnations for superior excellence and high culture. That medal came in during my recent visit to the gardens, and I can but affirm that it is the finest medal I have ever seen given as a horticultural award.

Border Carnations are grown in abundance outdoors, in special beds and in borders generally. They may be counted by thousands, and are first-rate plants. As especially good I noted The Countess, a very fine pure white, and Pride of the Garden, light rose; Duchess of York, soft flesh; Miss Audrey Campbell, lemon-yellow; Brigadier, scarlet; William of Wykeham, rich rose; Walter Ware, fine purple; Ruby Castle, pink; and the old true crimson Clove. These are but a few of many, and all of good stiff and erect flowering habit. The season seems so far to have suited Carnations, as besides great bloom-promises, there is ample material for layering also.

Violas and Pansies.—So far, although *Violas* are commonly used for bedding purposes, I have nowhere else seen them used to form bedding effects alone. But it is the rule at Dover House to fill a large area of ground in the gardens with these pretty plants, and many are the varieties planted. This season a very long border, fronting the glass-houses and about 7 feet wide, is planted with *Violas* absolutely. At the back is a broad margin of the rich blue, and probably the most popular of its colour, Archie Grant, and a similar margin of the strain Yellow Greive runs in front. Then the intervening space, 5 feet wide, is planted in triangles, the larger and alternate ones having their bases to the front, the reverse ones being smaller. Beginning at one end, the colours run somewhat thus:—The Mearns, Ballion, yellow; Max Kolb, blue; Champion, white; Mrs. H. Bellamy, plum, blotched white; Blue Cloud, here so far almost pure white; Mahogany, reddish striped; Sissy Mellow, of the Countess of Kintore style, but a far better variety; Wemyss, yellow, a capital one, and rich in colour; True Blue, Laverock, white; Acme, plum; Quaker Maid, Duchess of Fife, W. Neil, &c. It need hardly be added, that growth being good, and bloom abundant, this constitutes a very charming *Viola* border. Fancy Pansies, chiefly named varieties, are also largely grown, and very fine and beautiful they

are; still, they lack that pleasing effect which the *Violas* create. One variety—*Tamworth*, yellow—having a massive blotch, seems to be an exceptionally fine bloomer and grower. Just by these latter there is growing a patch of about a dozen plants of the small-flowered double scarlet *Begonia Count Zeppin*. This is planted thinly, on a carpet of silver variegated *Sedum* pegged down, and is but one of a beautiful bedding class of doubles too seldom seen in gardens, yet far more pleasing than is the large-flowered section. Here this double scarlet is brilliantly effective. Another interesting section of summer bedding-plants is seen in the *Celosias* which are growing here. More beautiful colours and better habits could hardly be found anywhere. Amidst large beds of *Asters*, *Stocks*, *Verbenas*, *Snappedragons*, &c., are some *Pentstemons* that are exceedingly fine in quality. These comprise some

ground, a grand crop; Peas, in spite of the heat, luxuriantly healthy, and blooming or podding profusely. All this is the product of high culture and constant supervision. *A. D.*

COLONIAL NOTES.

GRENADA.

Hippeastrum (Amaryllis) equestre, Herb. — For several weeks past (May), this good old garden favourite has been brightening up spots in the Botanic Garden, Grenada, and in the grounds of Government-house, half a mile distant from the first-named place. It grows wild in some parts of Grenada.

themselves beforehand with a pennyworth of Guinea-pepper, bought at a druggist's, and surreptitiously sprinkle the floor with it whilst dancing is in progress, the result being rows and fights shortly afterwards. *W. E. Broadway, Grenada.*

PRUNING PEARS.

THE objects of pruning a Pear-tree are to give it a required form, and to regulate its fructification. Without pruning, the branches grow irregularly, and often bear but once in two years. Our remarks apply here principally to dwarf Pears, and to those trained as pyramids, spindles, palmettes, candelabra, vases, or cordons, and for these we may lay down certain general principles.

Winter-pruning is begun as soon as the leaves fall

FIG. 23.—TRAINED GOOSEBERRY BUSHES. SHOWN BY MESSRS. JAMES VEITCH AND SONS.

(See our Report of the Royal Horticultural Society's Meeting of July 13, in our issue for July 17, p. 42.)

of the best northern named varieties, and they show what remarkable excellence these good biennials now display. Grapes are abundant and good, and Peaches and Nectarines in remarkable profusion. One range gives Dymond, Bellegarde, Condor, Grosse Mignonne, Early York, Princess of Wales, Prince of Wales, Marquis of Downshire, and Buckingham Mignonne Peaches, all fruiting finely; and Lord Napier Pine-apple, and other Nectarines. The Buckingham Mignonne Peach, it is said, was put into commerce so long since as 1817. Outdoors there were big breadths of Strawberries carrying great crops, and the plants in splendid condition. Superlative Raspberry is here wonderfully fine and early. Apples and Pears, on young and old trees alike, oddly enough carry capital crops, far better than most gardens show. Vegetables are first rate. Such breadths of spring-sown Onions cannot be excelled. Beets are already strong; Carrots, for the sixth year on the same prepared

Vanda teres, Lindl. — Annually at Government-house, Grenada, *Vanda teres* may be seen in flower. During the present month (May) an old dead tree-stump is there shielded and transformed into a beautiful object through this Orchid flowering upon it. It is wonderful the way in which, upon living trees especially, it throws out its long, winding, and branching roots.

Guinea-pepper [*Capsicum*?] is put to a curious use by some of our peasantry here, if the assertion of the fact by several of them is really correct. The peasantry are fond of dancing, and around the Botanic Garden dances are frequent, and carried on with great zest and vigour. It is a kind of subscription affair, each person paying so much per head for the privilege of the evening. Now, when among the members present there are those who wish to create hostilities, and end the evening perhaps in a fight, these members provide

in autumn, and ceases when vegetation recommences in spring. Pruning should be effected during the dormant period [when the sap is down, as the gardeners say], but not when there is rime or frost.

Prune in spring, when the sap is ascending those trees and branches the growth of which it is desired to check.

Prune in autumn those trees or branches which it is desired to develop and strengthen. Pruning can thus be carried on twice in the same year, by the removal in autumn of the woody branches; in spring, by the pruning of the fruit-bearing branches.

The branch should be cut at a point immediately opposite the bud which is to form the extension shoot. This bud is chosen: (1) on the upper side for a branch which is weak or inclined to grow erect; (2) on the lower side for a sloping, or one that is too vigorous; and (3) at the side for a branch which is directed obliquely.

If the shoot is spurred, the spur is cut away; an adventitious bud will replace it. For the branches of espaliers it is best to cut away the fore-right shoots.

The pruning back to an eye should be so done that when this develops it will remedy the deviation caused by the pruning of the previous year; if necessary a little stick may be tied on with two bands to support and train the extension shoot. Long pruning is that which leaves most wood on the branch, short pruning is that which removes most; the two operations may be performed alternately on the same tree in successive years. Long pruning favours fruit-bearing without encouraging the growth of useless unnecessary shoots; it is applied to weak or inclined branches or to those placed at the base of the stock. Long pruning is practised in the case of Pears grafted on the Pear stock or for those desired to form a large tree.

Short pruning is made use of for plants grafted on the Quince, or intended to be kept dwarf. Long pruning is best for trees in a cold situation, short pruning is more suitable for trees in a warm aspect. Long pruning is adapted for a sterile branch, short for one that is too fertile. Long pruning is desirable for plants which branch freely, short pruning for those which branch less freely. In long pruning, a branch which has become bare at the base, it is necessary to suppress the buds near the terminal bud, and to make a small notch above the eyes at the base.

A stunted branch or a tree regularly formed, may remain unpruned so as to strengthen it and promote its fructification. It may be pruned biennially so as to maintain the shape or branching of the tree.

When the eyes seem indisposed to open freely, they can be made to do so by making a notch with the pruning-knife above the eye; this incision, which should not exceed one millimètre in width, induces the inert eye to sprout. It must be understood that the little cut only penetrates the bark, which is raised on each side. This notch, employed in the case of robust trees, will not be without value in the case of *Beurré Giffard*, *Clapp's Favorite*, *Fondante des Bois*, *Louise Bonne d'Avranches*, or *Directeur Hardy*, trees which grow freely, and in which the buds at the base remain undeveloped, the upper buds thus profiting at the expense of the lower ones, so that it is well to pinch off the prominent and spurred-buds near the eye destined to form the growing shoot, to prolong the framework of the tree.

Now, if short-pruning be employed in the case of these varieties, to encourage the development of latent or inert buds, there is the risk of retarding fructification, which must be taken into consideration.

It will not be so with varieties more fertile than vigorous, such as *Dr. Jules Guyot*, *Madame Treyve*, *Colmar d'Arenberg*, *Marguerite-Marillat*, or *Beurré Clairgeau*, for which short-pruning is needful, although a few fine strong shoots should be left to lengthen.

Long-pruning has no drawbacks in the case of varieties which branch freely, for *Comte de Lambertye*, *Nouveau Poiteau*, *Alexandrine Douillard*, *Président Mas*, *Eva Baltet*, *Beurré Capiaumont*, *Beurré Bachelier*, *Charles Ernest*, *Le Lectier*, *Beurré d'Hardenpont*, *Passe Crassane*, *Olivier de Serres*, or *Bergamotte Sannier*. Nevertheless, short-pruning will be resumed when the tree is weakened by its fructification. We appreciate the superior flavour of *Beurré Superfin* and *Doyenné du Comice* when grafted on the Quince and long-pruned. The knives should be moderately used in the case of *Van Mons*, *Madame Lyé Baltet*, *Royale Vendée* and *Doyenné de Mont-jean*, which do not produce wood freely, but are perfect as to fruit. In the case of those types which usually branch regularly, and do not, as a rule, fruit excessively, such as *Précoce de Trévoux*, *Williams'*, *Triomphe de Vienne*, *Beurré Lebrun*, *Duchesse d'Angoulême*, *Beurré Hardy*, *Beurré Dumont*, *Baltet père*, *Doyenné d'Alençon*, pruning should be adapted to the strength and fertility of the tree.

In those trees where the fruit-buds are placed at the end of the twigs, such as *Doyenné de Juillet*, *Marie*

Louise, *Urbaniste*, *Bergamotte Esperen*, *Passe Colmar*, *Josephine de Malines*, these little fruitful branches are of course untouched, but when once the fruit is over the ordinary course is followed.

For fancy training with branches bent in various directions, training-sticks are indispensable, as well as pruning down to a bud which will take the desired direction. It is as well also to leave a short stump to which the young shoot can be tied. *Epargne*, *Beurré d'Amanlis*, *Beurré Diel*, *Triomphe de Jodoigne*, *Beurré de Rance*, *Figue d'Alençon*, and *Chamontel*, may be mentioned as instances. We must not forget to add that summer pruning is undertaken every year to complete or rectify the results of winter, autumn, or spring pruning.

It will be seen that each Peartree has its own special characteristics. We cannot too strongly advise fruit-lovers to study their orchards, to read good books, attend courses of arboricultural lectures, and especially to take the pruning-knife in hand with caution, but without undue fear of wounding their own fingers! *Charles Baltet, Troyes.*

CULTURAL MEMORANDA.

CAMELLIAS.

Those who, owing to excess of work, could not report their plants as soon as the flush of blooming had passed, may do so at this date. The bloom buds are now formed even on the latest plants, and if the plants are not afforded more water than will keep the soil moderately moist, no new top-growth will be made, neither will the buds fall off.

The repotted plants, if standing out-of-doors in half-shady spots, may remain there after being repotted, and if very heavy rains fall, and the heads are not dense enough to ward off a large proportion of the rainfall, two roofing tiles or slates may be placed over each pot. It is soon done, and prevents the soddening of the soil that would otherwise occur. Small plants may be plunged in coal-ash beds, and large ones in tubs stood on the surface on a brick at each of the four corners, shading the outside row of above-ground plants with slabs of cork, outside slabs of trees with the bark left on, or some similar contrivances. Do not afford manure water after this date, nor let moss grow on the outsides of the pots or on the soil. A syringing once a day in hot weather is very beneficial to Camellias either indoors or out.

Grafting may be done in close handlights placed within deep cold pits at this season, employing any kind of grafting for the purpose; and covering the point of union with clay or grafting-wax. Whip or side grafting with a leaf or two of the stock retained above the graft, answers capitally, as does cleft grafting, with a growing bud left at the top till the union takes place. Gardeners should not be running to the nursery for young plants they can easily raise at home, any more than they should buy their Cabbage or Celery plants from the same source which few indeed do.

HOME CORRESPONDENCE.

LISIANTHUS RUSSELLIANUS.—This is a plant in which I have long had a great interest, and which I am never without; seeds are nearly always obtainable, and "R. D." in the issue for July 17, p. 40, need have no fear of its being lost—for the present at any rate. If there were time always to attend to it at the right moment, its culture would not be attended with much difficulty. When sown too early in autumn, the plants attempt to flower, and are then absolutely spoilt; while if sown too late the plants do not make good crowns, and cannot in consequence send up strong stems the following year. A nice adjustment of the time of sowing, temperature, and position, is absolutely necessary to obtain a good result. Spring sowing may be successful, but the safest plan, no doubt, would be to make several sowings. I have had very good success by growing the young plants on for flowering in a hot-bed in spring, the rosette stage having been reached

the preceding autumn. The plant is properly a biennial. *R. J. Lynch.*

SPOT IN DENDROBES.—This is an affection which the most experienced and the most observant persons among us cannot get to the bottom of. We battled with it in the Rev. M. J. Berkeley's days, he from his scientific dealing with it, we as practical men face to face with it in our Orchid-houses. Young men in the exuberance of youth and partial success in cultivation pooh-poohed it, and lectured very knowingly in their own houses how it could be mastered; but as age and experience crept on them, their assertions became less wild, and they had to "eat the Lark." I assert, without fear of contradiction, that there is no collection of Dendrobies in this or any other country completely free from "spot" in the young growths of Dendrobies. There is no doubt that this in-and-in breeding aggravates its production. Take one of the earlier of crosses, *Dendrobium Ainsworthii* roseum, and you will find some difficulty in getting a spotless-leaved plant of it. The fact is, since Mitchell showed the plant of it in Manchester some twenty-six years ago, there never has been a spotless plant of it. Moreover, this "spot" in some things does not confine its ravages to the leaves; it gets over the bulbs in the course of ripening, and all the various kinds of treatment adopted will not induce such health as to make the plant marketable. Coming down to more recent times, and taking *Dendrobium splendidissimum* illustre, a similar disposition to the affection or disease, or whatever you may call it, is found; and up to the present time we have no specific either cultural or anything else that will rid the *Dendrobium* altogether of the pest. We all know that *Dendrobium nobile* is the champion parent of some of our choicest gains, and that is a species less liable to the incursion of spot or troubles than any other of the family. And yet we are not without our troubles here. Take the white ones, which are natural hybrids, and we find that they are disposed to this form of gangrene, affecting floral reproduction. *D. Amesiae* and other albinos bearing different names, but only infinitesimally varied, grows into shoots that bear in time spotted leaves, as do even the selected forms which have risen so much in value. Even the giant and the most valuable of the noble family, *D. nobile nobilissimum*, is badly spotted in many collections, and so are noble *Sanderianum*, noble *Statterianum*, and that little perfectly-formed gem, noble *Hardyanum*. So that cross-breeding is not the sole cause of inherent or predisposed weakness. The very commonest forms taken from various localities—high altitudes and low grounds—fall a prey to the spot trouble. Now what is the remedy? Is there any specific treatment that will tire out the enemy in the various glass chambers distributed over the country? I have noticed over a series of years some collections comparatively free of this, but none absolutely free, and gardeners are at their wits' end in trying to improve upon these varying conditions. We may be told that the atmosphere is too dry, or too wet, or too confined from a ventilation point of view, is too draughty—indeed, we can conjure up dozens of causes, but true, the palpable fact remains that one portion of a plant is without flaw, while another portion is more or less affected. Some aver that they do not attach any importance to spotting in a strong plant, and after a time they cut off the leaves, hoping that next year's crop will come sound. But does it? And then any first-rate culturist will bar spot as a thing detested and detestable; and so do I. But where is the sovereign remedy? This is a matter suitable for threshing out by our numerous practical men. The field is now a wide one, tens of thousands being imported every year. Moreover, the love for Dendrobies is increasing vastly, and plastic as this division of them is in our hands, we are not a bit advanced, from a cultural point of view, since the beginning of the Victorian Era. A little healthy debate in your columns would undoubtedly stimulate investigation and bear fruit. *James Anderson, Manchester.*

FROST IN JULY.—No wonder Mr. Kitley, when writing from Warwick last week, expressed astonishment at the low readings recently indicated by his grass minimum thermometer. Judging from the temperatures he has given (p. 56), I venture to assure him that it is very unlikely there could have been a frost on any of those ten nights, although the indications of that thermometer have no doubt been correctly recorded. A few facts will indicate my reasons for coming to this conclusion. According to Mr. Kitley's table, the average difference for the ten

nights between the temperatures registered in the Stevenson screen and those on the grass exceeded 18°, while the greatest difference on any one night was 21°. Here, at Berkhamsted, taking all the nights of the last twelve July, the mean difference between the indications of the grass thermometer and that in a Stevenson screen is found to be less than 5°, and the greatest difference on any night during that period 9°. Then, again, if we confine the comparisons between the two places to the coldest night of the present month, the lowest reading in the screen was 2° colder at Berkhamsted than at Warwick, and yet the exposed thermometer never fell lower than 33°, whereas at Warwick on the same night a similar thermometer showed 9° of frost. I should say there must be something like 10° of spirit lodged in the upper part of Mr. Kitley's exposed thermometer, and until this instrument is set right, its readings must always be to that extent too low. When will gardeners and others using minimum thermometers learn that no instruments more readily get out of order, particularly if exposed at any part of the day to the sun? In fact, scarcely a month passes that my own grass minimum thermometer does not require setting right. The tube above the spirit, especially the upper part of it, should be frequently examined, and if any spirit be found to have evaporated and become condensed there, it should be shaken down by holding that part of the thermometer furthest from the bulb securely in the hand, and swinging it sharply downwards at arm's length until the truant spirit has been made to rejoin the main thread. Our British climate is already too cold for the well-being of many of our garden favourites, without the repeated attempts of garden minimum thermometers to make it out even worse than it really is. *E. M., Berkhamsted.*

RASPBERRY GUINEA.—The raiser of that splendid red Raspberry, Superlative, has also obtained as a seed-sport from that variety a white one, that seems to be an exact reproduction in growth, leafage, size, and quality of fruit of its well-known parent. The stock is now in the hands of Messrs. G. Bunyard & Sons, Maidstone, in whose nursery I recently saw it growing. Practically, it is a white Superlative, and the size of the fruits will make it a valuable addition to our dessert Raspberries. Messrs. Bunyard have also a wonderful stock of Superlative growing on their seed-farm; the growth is very stout, sturdy, and from 3 to 4 feet in height. The suckers on this limestone formation produce roots abundantly, and there must be on the breadth 100,000 at least, so extensive is the breadth. The variety has in growth and leafage very marked character, which the new white exactly reproduces. *A. D.*

VINES AND THE XL ALL VAPOUR.—I have vaporised Vines here when the fruit has been hanging with XL All, and found no evil effects. It has generally been done when the Grapes were starting to colour. I have found it kill some of the spider, apparently the older ones, as what appeared very young were still very active; but I have found it necessary to take out of the house all *Adiantums*, especially *Farleyense*. I think with a free and judicious use of XL All, no gardener need be troubled with many insects—the Tomato-fly does not appear to like it. *J. Barnard, Mostyn Hall Gardens, Flintshire.*

THE EXCLUSION OF FOG FROM PLANT-HOUSES.—With reference to the exclusion of fog from plant-houses (see remarks in last issue, p. 47), I venture to suggest the use of pounded gas-coke as a probably efficient filtering material. I do so on account of the success I have had in cleansing the exhaust from a gas-engine. The products of combustion from the explosion chamber were formerly offensive, and particularly inconvenient, by depositing oily matter, which was very difficult to remove, on the roofs of the plant-houses. Now, however, by leading the exhaust through a brick chamber in the ground, filled with about a sack and a half of coke, I find that nothing more than light whiffs of pale smoke come through, which are quite unobservable in certain states of the weather, and sometimes cannot even be detected. The coke remains efficient for at least an approach to a couple of years, and for straining out fog would probably last an almost indefinite time. An enormous quantity of matter is removed from the exhaust of the gas-engine, even to the extent of having to pump liquor out of the chamber once a month, and it appears to me only a question of method to secure an equally good result in the case of fog. Our fogs are fairly pure and uncontaminated, so that no experiments of the kind are required here. *R. Irwin Lynch, Botanic Garden, Cambridge.*

VEGETABLES.

FRENCH BEAN, SUPERB EARLY FORCING.

THIS variety of Kidney Bean sent out a year or two ago by Messrs. J. Veitch & Sons, being an early cropper out of doors, is a useful acquisition to our list of Beans. Sown this year at Dropmore in the open garden, alongside of and at the same time as *Ne plus Ultra*, it furnished usable pods about ten days earlier than the latter. The sowing was made on April 23, and we gathered pods of Superb Early on July 7, and more than a week will elapse before pods of *Ne plus Ultra* can be gathered. The new variety is of rather stronger growth than the latter, has dark green foliage and pods, the latter being produced in abundance. There may be others of equal earliness, but this is the earliest I have yet grown. *C. H., July 10.*

BURFORD, DORKING.

THE beautiful gardens of Sir Trevor Lawrence, Bart., famed above all for its marvellous collection of Orchids, also afford a home for all the newest and best plants for flowering in the open garden, and in which, whatever good qualities they may possess, are shown at their best. Thus, from early spring to late in the winter, in the pretty garden nestling at the foot of Box Hill, the rare, as well as the showy flowers of each season, are to be seen in perfection. At the present time, the showiest and most profusely flowered are the beds of the newer kinds of *Pentstemons*, with tall spikes of richly-tinted flowers; a fine bed of the graceful carmine-scarlet *Pentstemon barbatus Torreyi*; and a few other species of *Pentstemon*, of which the blue *P. heterophylla* is very distinct and of a charming tint. On one side is a long bed of mixed white and pink *Malva grandiflora*. One bed is filled with *Platycodon grandiflorum* var. *Mariesii*, covered with rich dark blue salver-shaped flowers; another with *Lobelia cardinalis* varieties; one of the showiest is made of mixed colours of the new varieties of *Salpiglossis*; and in several places a great show is made by *Glaadiolus Lemoinei* and other hybrids. One bed of Lemoine's new *Phloxes* contains a large proportion of sterling novelties, both as to size and colour of the flower, a fine large pure white, and a very beautiful new carmine-coloured variety being specially noteworthy. In the portion set apart for the Roses, there is still a good show, the arches being covered by *Crimson Rambler*, which still retains its profusion of brightly-coloured flowers, although earlier in the season they were still more beautiful.

One nook in the garden enclosed by the Orchid-houses, is especially showy and interesting. The brickwork of the houses is hidden by the rich growth of rows of *Crinum Powellii* and *C. Mooreanum*, which here stand out all the winter, and are now plentifully furnished with their stately bluish-white flowers. At one end are a number of the pure white *Crinum Powellii album*; and in the centre are several pyramidal plants of *Streptosolen Jamesoni* covered with its brilliant orange-red flowers. On one side the varieties of *Nymphaea Laydekeri*, *N. Robinsoniana*, and others of that class are very successfully cultivated in tubs of water sunk in the ground, and are now bearing a good show of flowers varying from light yellow to pink and crimson, behind them being tall, trained plants of *Mina lobata*, *M. sanguinea*, and *Rhodochiton volubile*, the last named a fine old climber with dark purple flowers, which might be more commonly grown in gardens with advantage. The beds filling the central space of the pretty enclosed garden have a fine selection of scarlet, crimson, yellow, and spotted *Cannas*, which are here grown to perfection both in the open garden and in the greenhouse, where their ornamental foliage and richly-tinted flowers arrange well with the tuberous *Begonias*, which give the greatest show of colour at this season. At the end of the greenhouses is a fine batch of hybrid *Streptocarpus*, and suspended overhead plants of the graceful *Lotus peliorhynchus*, which, as grown at Burford, is one of the most elegant of hanging plants.

The Orchids at Burford furnish more novelties and more surprises than any other collection has ever done. If a plant is long talked of as being unmanageable or impossible to flower, in time it turns up in perfection in Sir Trevor Lawrence's collection. The latest instance of this is the fine *Vanda* × *Miss Joaquim*, illustrated from the Burford collection in the *Gardeners' Chronicle*, June 26, this year, and which, after being divided into two, seems now about to flower again. But even a more remarkable instance is the flowering of the gigantic *Grammatophyllum speciosum*, which has only flowered on three or four occasions in Europe. The large specimen at Burford has a very stout inflorescence, with distant buds on the basal portion, and a number more closely arranged on the upper part. Its wonderful and showy flowers will soon be expanded, and will possibly be seen at the next meeting of the Orchid Committee of the Royal Horticultural Society. The grand collection of Orchids still retain their usual vigour throughout, and the many rare and singular-looking botanical species, which always give such interest to a visit to Burford, furnish a number of pretty subjects in bloom, although the showy kinds such as *Cattleyas* and *Lælias*, are now for the present over. In one house the centre table was occupied by a very fine collection of large specimens of all the species of *Sobralias* worthy of cultivation, and already *Sobralia macrantha*, *S. xantholeuca*, the pretty lilac-coloured *S. Lucasiana*, *S. x Veitchii*, and others, are in bloom, and many more in bud. In the same and adjoining house the tall-growing *Epidendrums* are very showy, among them being *E. radicans*, still the richest and best in colour; the bright red and yellow *E. Moensii*, and *E. Schomburgkii*; the rose-coloured *E. Ellisii*, and the dark-red *E. O'Brienianum*, *E. Wallisii*, *E. nemorale*; also a pretty orange-scarlet coloured hybrid raised at Burford; and of botanical species, *E. amplexicaule*, with purplish leaves and whitish flowers; *E. volutum*, and others of that class.

In the cool-house, where the fine collection of *Masdevallias* always present such a good appearance either in or out of flower, are a number of interesting things in bloom, such as *Masdevallia trichete*, *M. tridactylites*, *M. platyglossa*, *M. sororula*, *M. Reichenbachii*, *M. Stella*, *M. infracta*, and others of the lesser *Masdevallias*; also among the *Pleurothallis*, *P. macrolepharis*, with its gnat-like flowers on almost imperceptible stalks; *P. rhombipetalum*, &c. Here, too, are some pretty plants of *Odontoglossum aspidorhinum*, *Lehmanni*, profusely flowered; well-bloomed *Stenoglottis longifolia*, some of the smaller *Zygopetalums* of the *Promenaea* section; and the plants of *Colax jugosus*, which thrive better in the cool-house than in the warmer ones where it generally grows.

In one lean-to house of a cool temperature in flower were *Odontoglossum Uro-Skinnersi*, *O. Schleiperianum*, and a few other *Odontoglossums*; *Oncidium spillopterum*, *Maxillaria Hübschi*, *M. venusta*, *M. fucata*, and other *Maxillarias*; in a warm house in flower were a number of *Cattleya Eldorado*, and its white variety, all very beautiful, and delightfully fragrant; the yellow-spotted *Oncidium guttatum*, the scarlet *Habenaria rhodocheila*, *Cypripedium* × *Laurel*, the singular *Luisia volucris*, and *L. cantharides*, both with insect-like blooms; and various *Cypripediums* of the *Selenipedium* section.

Among the more noteworthy of the other plants in bloom were a fine specimen of the rare *Catasetum Russelianum*, *C. Oerstedii*, with a very strong spike of unusually showy flowers; the charming *Dendrobium* × *micans*, still one of the most beautiful of hybrid *Dendrobiums*; the rich scarlet *Epiphronitis Veitchii*, *Aganisia ionoptera*, the elegant *Platylinis filiformis*, with nearly one hundred spikes of flowers; the rare and beautiful *Polycycnis Lehmanni*, *Cypripedium caudatum* *Wallisii*, *Vanda Hookeriana*, *Brassia brachiata*, *Lælia monophylla*, *Dica* × *Kewensis*, the handsome *Eulophia guineensis*, the singular little *Phalænopsis Listeri*, *Angræcum Scottianum*, *Renanthera matutina*, *Dendrobium Dearei*, and a number of other *Dendrobes*, some of which, from New Guinea, supposed to be new, are about to flower.

THE HERBACEOUS BORDER.

TRILLIUM GRANDIFLORUM.

MANY people complain of their want of success with this pretty North American plant, and it is by no means one of the easiest of subjects to deal with. A few days ago I met with the finest plant of it that I have ever seen, growing in the garden of Ketton Cottage, where Mr. Burroughes possesses a fine collection of hardy plants. The plant was shaded from direct sunshine by the overhanging branches of some Rhododendrons, and I was informed that it had been planted there quite ten years ago, in a mixture of peat and Nottingham peat-moss manure—the same soil, in fact, as the Rhododendrons were growing in. The situation is low, being by the side of a brook which frequently overflows its banks in the winter and spring. It was exposed to the north and east, but the force of cutting winds is broken by friendly screens of shrubs at no great distance away. This plant had fourteen flowers, more or less expanded, the largest of which measured over 5 inches in its greatest diameter. *W. H. Divers, Belvoir Castle Gardens.*

NURSERY NOTES.

WALTHAM CROSS ROSES.

FOR better or worse, according to circumstance, thunderstorms are frequently of a very local character. It was due to an unusually remarkable example of this phenomenon that we were able to see the Roses of Messrs. W. Paul & Son, on the 20th inst., under favourable conditions. A courteous invitation to pay what proved to be a very interesting ramble was accompanied by a hint that a storm might at any time ruin the effect the profusion of blooms created. The train had hardly left Liverpool Street Station, before it appeared that we should be too late, though not an hour had been allowed to escape before accepting the invitation. London was dry, and the grey, dusty streets to the east of the city were just as suggestive of drought as they had been previously, but the train had no sooner conveyed us into the suburbs than it became evident that an extraordinary storm of rain had fallen over Stratford, Clapton, and the immediate districts. Some fields along the route were flooded, and there had been a deluge. What would the Rose Nursery be like? We thought of former visits to similar places, and remembered what an amount of water each bunch was capable of holding for a time, and how cheerfully it shed every drop upon the person unfortunate enough to brush past and touch it. But there were signs that we were leaving the fury of the storm, and in a few minutes we alighted at Waltham Cross to find that not a drop of wet had fallen there. We must dismiss this circumstance of our visit, however, though some who have lived in the district for upwards of sixty years declare that they have not previously witnessed a severe storm so localised.

A visitor to these nurseries for the first time would probably be struck by one or two features of their situation. On one side the ground is bounded by the high road from London to Cambridge, on the opposite by the Great Eastern Railway line also to Cambridge, and from Waltham Cross Station the nursery is entered from a third side. Now the offices are upon the high road, and from these to the railway line there is a broad green walk flanked on either side by coniferous and other trees of an ornamental character. This distance is about 600 yards, and the walk being moderately high a very good general view of the nursery, and an idea of the stock it possesses can be obtained. Moreover, it is a very pleasant vista, and it gives a characteristic to the establishment of a kind that many such places lack. If the visitor happens to be a Rose loving individual, these general features have been noted in less time than it takes to describe them, and he has left the pleasant greensward for the breadths of Roses, here, there, and everywhere. On the one hand is a breadth or plantation of Teas and Noisettes, and of hybrid Teas, Maidens upon the Briar

stock. On closer inspection one notices the free-flowering Clara Watson, a salmon-pink flower, and one raised by Bennett, whose memory English rosarians have cause to cherish. Then there is Souvenir de Madame Sableyrolles, a variety with many shades of colour, and Marie d'Orléans, a good Rose resembling Madame Lambard, but a few shades deeper in colour. It is one of a number that Mr. Paul selected from the Riviera, and might be appreciated by some who at present do not know it. White Lady there was introduced by this firm some half dozen or more years ago, and was recently honoured by an Award of Merit of the Royal Horticultural Society. It has creamy-white flowers, and may be recommended to any gardener who has not made its acquaintance. Madame Hoste is very well known, so is Viscountess Folkestone, a H. T. of Bennett's. How free it is to be sure! Its large flesh-tinted flowers are numerous upon every plant, and its foliage fine and healthy. Grace Darling, another H. T., and Sunset, a pure Tea, are noticed. The latter is very pretty as a freshly-opened bud, but soon loses some of its colour. Lady Mary Fitzwilliam, a H. T. that every exhibitor ought to grow, and Camoens, pure Tea, are dissimilar in character but equally desirable. Camoens makes a good bedder, being very free in its production of rose-coloured flowers, shaded yellow from the centre, and it is comparatively a constant bloomer. Passing Francesca Kruger and the pretty yellow-flowered Etoile de Lyon, we observe a bed of Noisette varieties where W. A. Richardson and the little gems so useful for a variety of purposes might be studied did time permit. Mention must only be made, however, of a creamy-yellow Noisette, described as Madame Bernacchi, apparently free in flowering, possessing good petals and very promising. Turning from the picture the delicately-coloured and prettily-formed Teas create, to the hybrid perpetuals, there is more rich colour, and they are much more showy. Abel Carrière, A. K. Williams, Marie Baumann, and Fisher Holmes are effective anywhere, and being maiden plants, these rather shy-flowering exhibition varieties, even A. K. Williams, were seen in satisfactory condition. But how free is Captain Christy! The half-dozen rows of this variety, in which each plant close habited with a few huge pinky-white blooms clustered together, are very distinct in this respect. Gloire de Lyonnaise and Horace Vernet are well known, but the latter is worth a word of praise even in this hurried criticism—its petals are good and the colour brilliant. Coming again across some hybrid Teas, one notices the variety known as the White La France, viz., Augustine Guinoiseau, which, though not pure white, may be described as such in comparison with the type. It is useful as a bedder because it has the form of La France, but in another shade. La France is close by, but it suffers through being in close proximity to Caroline Testout, a much higher coloured Rose than La France, but of less exquisite form. The hybrid perpetual General Baron Berge, raised by the same French grower as Merveille de Lyon and many others, deserves to be grown more frequently than it is. It is a scarlet-crimson flower with a shade of violet, an excellent bloom even when fully out. Next is Clio (Wm. Paul & Son), a grand H.P. with flesh-coloured flowers, rosy in centre, very large, and produced freely; it is described by Mr. Paul as an excellent pot-Rose in May. We now stay to admire two of Messrs. Dickson's new Roses—Helen Keller and Mrs. W. J. Grant (Belle Siebrecht). They are pretty well known now as being very valuable acquisitions, but the extraordinary vigorous growth and free-flowering habit of Helen Keller was certainly remarkable; like some other good varieties, they are susceptible to mildew. We must hasten to mention a few others of the newer varieties, some of them introductions by the Waltham Cross firm. The first may be Waltham Standard, H.P., likely to make a first-class exhibition Rose, of vigorous habit, flowers much resembling those of A. K. Williams, but distinct in shade of colour. Zephyr (Tea-scented), a capital variety for bedding, of vigorous and free habit, flowers open, yellow, fading to tinted-white. Sylph, a Rose of most pleasing colour, deep salmon flesh in centre,

of good size, and well built. We were fortunate in seeing blooms of this and a few other varieties that had been cut in the morning, and therefore possessed very much more colour than those upon the plants after midday in hot sun. Eucharis, figured in *Gard. Chron.*, Dec. 7, 1895, was well represented; it is a tea-scented Rose for any garden, being vigorous and free, and it is well known to be exceptionally valuable for winter forcing. Mrs. Ada Carmody is a pretty new Tea of pink colour, but the petals on the inner side are curiously tinted with yellow.

One of the very best of the new Teas is Empress Alexandra of Russia; its colour is very difficult of description, but may be said to be deep red, shaded with orange. The red colour is an unusual tint. It is certainly a grand Rose from any standpoint, but more particularly by reason of its pleasing colour.

A new China Rose from the Continent, and named Madame Eugène Resal, is deserving of praise also by reason of its bewitching colour; it is very variable, but in certain stages it cannot but please. Like most of the China Roses, it is very free, and may be used for massing. Grand Duke A. de Luxembourg, H.T., Ella Gordon, H.P., and Duchess of Bedford, H.P., are Roses worthy of note; but we must not linger. Several varieties of Rosa rugosa, and some other garden Roses were admired also. A large breadth of climbing varieties had made very good even growth, but these flower little the first year, though a few blooms appeared upon Waltham Climbers Nos. 1 and 3. The plants of Maréchal Niel were very praiseworthy.

Has the season been propitious to the growth of Roses? At Waltham Cross, Yes. Mr. Paul admits he is well satisfied with the growth they have so far made, and they have bloomed well also. The Rose-bushes here are much the same as one sees them in his own garden. There is an absence of the special high cultivation for exhibition blooms, and possibly this is the better for the plants. The usual stocks are used, but the great majority are upon the Briar. The Manetti is useful for trees that are to be cultivated in pots, and because of its irritability, it is especially desirable for forcing. The process of budding for the present season has been commenced.

STOCK OTHER THAN ROSES.

Our reference to the general nursery stock must be brief, but it should not be assumed that Rose monopolise all of the 40 acres at Waltham Cross, and of the three other nurseries possessed by the firm; trees and shrubs, fruit trees (trained and untrained), pot-Vines, and even Dahlias and a very miscellaneous collection of plants are grown. Besides these, most of our readers are aware that Messrs. Paul keep up a capital collection of Camellias, and one that is quite unequalled in this country. But our short afternoon visit was at an end, the return train to the city had to be caught, and so, with thanks to the veteran rosierist, Mr. Wm. Paul, who, it is pleasing to record, is still in the enjoyment of excellent health, and to his son to whose courtesy we gladly acknowledge our indebtedness, we take our leave.

MESSRS. H. CANNELL & SONS.

At so extensive a nursery as that of Messrs. Cannell & Sons, it is not a light task to pay a visit at any time of the year and to confine one's remarks to one or two subjects only. On the occasion of a recent visit, Carnations formed the object of our quest, and it was a surprise to find a collection of these plants grown in 8-inch pots under glass. The method has its advantages, especially when seed-saving forms one of the objects in view; moreover, a house enables the grower to afford shade readily in hot weather, and to keep the temperature comparatively cool by means of ventilation.

The plants are layered in the pots, the operation being done easily by almost filling up the great amount of space left at the potting above the ball, the plants being stood outside fourteen days after being layered. Nice blooms were remarked of the following:—Mrs. Gooden, a yellow ground with crimson edge; W. Coombe Miller, a seedling raised

on the place, a fancy with crimson markings on salmon-red. Seedlings, indeed, were rather many, but as names were attached in only a few instances, we can only allude to them in general terms. Carnation *Mme. Van Houtte*, a flaked variety, purple on ground of yellow; *Irene*, a crimson bismarck, a good show variety of vigorous habit; *Monarch*, crimson-flaked on yellow ground; *Miss Andrée Campbell* (one of Mr. Martin Smith's raising), a beautiful yellow self—one of the best; *Booklin*, also yellow, with a rich crimson margin, of German origin; *Mrs. Douglas*, a yellow-ground Picotee of great excellence; *Maggie Cocker*, a rose-coloured self; *Daphne*, *Haidée Falbe*, *Besume*, *Montague*, *Lorna Doone*, *Pride of the Garden*, a rosy-pink self, like the foregoing, but a better flower; *Figaro*, *Duchess of Portland* (*Lambe*), *Maggie* (*Cannell*), a deep crimson fancy; and *Mrs. A. Tate*. Owing to growing the plants under glass, they will keep in good condition for a week or two longer.

An account of what we observed in some of the other houses, and in the open ground, will appear in our next issue.

NEW INVENTION.

A CARNATION CLIP, AND A LEAD CLIP FOR FRUIT TREES.

We should not like to assert that this neat little contrivance, the invention of Mr. H. A. Davidson, of Holkham, Norfolk, for supporting the flower-stems of Carnations is absolutely new—indeed, there is little of this kind of thing under the sun that is new. It is however easy of application, very durable, almost invisible, and cheap. It consists of two rings of twisted steel wire separated from each other by a twisted wire strand of about an inch in length, which are slipped over the wooden stick that is to serve as the support to the Carnation-stems, the latter being embraced by two semi-circular ends of the lower ring, which open when slightly squeezed and admit the stems. If the clip be placed between the stem-leaves just above a joint it cannot descend, but will be carried up by the stems as these grow in height. The leaden fasteners of clips, also "something absolutely new," are intended for securing fruit trees, Roses, and climbing plants of all kinds to walls and trellises; and they are made of various sizes and shapes. The form is that of the hanging nursery-label, that is, an oblong, whose length is four to five times its breadth; and from the centre of which, in the case of the larger sizes, a strip of the metal is cut so that the clip has as it were two fingers. At one end the clip has a hole punched out, through which the nail or tie passes that fastens it to the wall or trellis, the fingers or loose ends clipping the branch. It is an application of a flattened form of fastening in lead, for the rounded leaden wire that was much in vogue in gardens for the same purposes a generation or more ago. These fasteners are to be obtained from Dacre House, Arundel Street, London, W.C.

LAW NOTES.

LITIGATION BETWEEN ORCHID GROWERS.

JUDGE PARRY, sitting at the Manchester County Court, July 28, heard the case of *Ashworth v. Wells*. It was an action brought by Mr. Elijah Ashworth, of Harefield Hall, Wilmslow, against Mr. Matthew Wells, of Sale, to recover £50 damages in respect of a breach of a warranty as to the nature of an Orchid. It was purchased by the plaintiff in 1895. The plant figured in the catalogue as "*Cattleya Acklandiae* alba, the only known plant." On behalf of the plaintiff, a number of well known cultivators were called. They included Dr. Hodgkinson, and Mr. G. S. Ball, solicitor. Their evidence was to the effect that if the Orchid had been an alba, perfectly white and well-shaped, it would have been worth from 70 to 150 guineas. It turned out, however, that the plant only produced a coloured flower of no particular value. It was the plaintiff's case that he bought the Orchid to be a genuine alba, and he

thought he had got a bargain when he got it for 20 guineas. Mr. Tweedale, who appeared for the plaintiff, informed the court that the action had been brought as a test case. It was submitted by Mr. Newman, who appeared for the defendant, that there had been no deception. His honour reserved judgment, remarking that as two years had elapsed between the purchase and the parties coming into court, they probably would not object if he took time to consider his decision. He added that the case would give him something to think over during his holidays.

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 27.—The meeting held on the last occasion in the Drill Hall was of considerable interest, although, in point of numbers, the exhibits were fewer than at the previous meeting. Among striking plants was a new hybrid between a *Laelia purpurata* and *Epidendrum radicans*, a successful effort of Mr. SENEZ to cross two such dissimilar genera; a new dwarf Sweet Pea resembling Burpee's *Cupid* in all save colour; some beautiful *Gladioli* which we never see so well flowered as at Langport; a beautiful group of *Watsonia Ardeni*, and the seldom seen *Exacum seylanicum macranthum*, aptly called by some the Ceylon Gentian, from its beautifully-coloured blossoms; a quantity of charming Roses from Cheshunt including the cream of English seedlings of garden varieties, and others. Lovers of fruit could not fail to admire the splendid collection of Gooseberries shown by Messrs. VERRICH & SON.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. W. Burpee, H. B. M-y, R. Dean, G. Gordon, G. Stevens, F. W. Sander, J. Hudson, J. F. McLeod, W. Bain, J. Fraser, C. E. Shea, J. Walker, C. E. Pearson, H. J. Jones, J. D. Pawle, G. Paul, D. B. Crane, E. Mawley, John Fraser, and H. Selfe-Leonard.

A considerable number of subjects came before the Floral Committee on this occasion, and a fair number of them obtained Awards of Merit. It is curious to notice, however, how many things of inferior merit find their way to the Committee table, leading to the inference that some exhibitors, at least, entertain low estimates of the improvements which have been made in the flowers they exhibit.

Gladioli formed a leading feature. Messrs. KELWAY & SON, Langport Nurseries, sent a stand of twenty-four novelties, most of which were entered for awards; prominent were *Carlton*, bright pale purple, novel and distinct in colour (Award of Merit); *J. G. Clarke*, one of the new Saunders' hybrids, large, bold, cerise in colour, the pale throat slightly spotted and flaked with purple—distinct, and very fine (Award of Merit); *Robert Kerr*, bright reddish-crimson, large in size, and striking in colour. *Sergeant Scott*, maroon flushed with crimson, one of the darkest. *Wearie Wyche*, bluish, flaked and pencilled with pale carmine, a very pleasing soft variety. *Harold Longster*, the ground colour rose, flushed and flaked with bright orange-crimson. *W. B. Child*, pale ground flaked with rosy-crimson and purple. *Jonathan Langford*, pale ground, heavily flaked with scarlet-crimson. *John Downie*, another of the new hybrids, pink, flushed with delicate cerise, the pale yellow throat marked with maroon, &c. In addition the firm had a collection of seventy-two spikes of standard varieties, chief among them such dark maroon crimson varieties as the *Shahada*, *Wellington*, *Don José*, *Chalmus* and *Nada*; and of other varieties, *John Hobhouse*, *Prince Henry*, *St. Gatien*, *Basile*, *Semolina*, *Callipho*, *Utopia*, *Empress of India*, *Priestly* (one of the best yellows), *Lady Derby*, and *Lord Swanses* (pale yellow), with others. Messrs. Kelway & Son also had *Asclepias tuberosa*, a fine bunch of this old favourite being staged; *A. syriaca*, a strong-growing but not very ornamental species; some *Gaillardias*, *Chrysanthemum maximum* sili. fers, with pure white narrow petals; boxes of cut *Gaillardias*, and boxes of bunches of hardy flowers, including *Scabiosa caucasica* alba, *Coreopsis grandiflora*, *Allium descendens*, deep crimson; *Achillea eupatorioides*, &c.

From H. B. SARTRETT, Esq., Shooter's Hill, came Sweet Pea *Pauline*, creamy-white, with buff and pale rose standards.

Mr. W. Bain, gr. to Sir Trevor Lawrence, Bart., Burford Lodge, Dorset, staged a number of new forms of hybrid *Gladioli*, among which one stood out from all the rest for its great size and beauty, viz., *General Duchesne*, rich rosy-cerise, flushed with purple on the margins of the petals, and having a conspicuous buff throat (Award of Merit); also, *Mrs. Beecher*, bright red; *Enfant du Lorraine*, yellow; *Veauve*, orange-crimson flushed with maroon, dark centre; *O. F. Quintius*, pinkish-rose, with scarlet and white markings; *W. Watson*, pale pink, with red and yellow centre; also, cut blooms of *Crinum* *Powell* and *Moore*, with spikes of the fine strain of *Pentstemon* grown at Burford.

Carnation *Mrs. Moore-Bliss*, a well-formed pale yellow self, with a good pod and habit of growth, came from the

SURREY SEED CO., Redhill; it appeared to be a good form of *Pride of Peasbush*, but does not split its calyx.

From Mr. J. Bugg, gr. to A. SHUTTLEWORTH, Esq., Eastgate House, Lincoln, came an attractive *Croton* named *Shuttleworthi*, a narrow-leaved variety of drooping growth, the ground of the leaves cream, marked with deep olive-green, and having rosy veins (Award of Merit).

Mr. G. DAVISON, Ammanford, R.S.O., sent half-a-dozen plants of bedding *Pelargonium* *Anna Bateson*, very dwarf and compact in habit, freely producing stiff, erect trusses of bright salmon double flowers, flushed with carmine (Award of Merit).

Some pretty herbaceous *Phloxes* came from several sources. Messrs. PAUL & SON, The old Nurseries, Cheshunt, had several of M. Lemoine's new varieties, such as *Lord Rayleigh*, purple, flushed with blue (the nearest approach to a blue *Phlox* we have yet seen), the tips stout and of good form (Award of Merit); *Erbenement*, bright rosy-salmon, with violet eye, very pleasing in colour, and good shape (Award of Merit); *Fantasia*, white, more or less flushed and striped with bright purple; *Huxley*, white centre, margined with lilac-pink; *Bayadere*, small white, good form; *La Neige*, white, rather purer; *La Sicle*, pale rose, with a ring of delicate purple round the eye; and *Panthéon*, salmon. Messrs. Paul & Son also had *Cineraria* *maritima* *Diamond*, a dwarf, compact, silvery-leaved form, likely to make a most useful bedding plant; *Canna* *Miss Elsie* *Parkins*, pure yellow, but not shown in its best character (Award of Merit); *Cupressus Lawsoniana erecta aurea*, which the committee wished to see again in a more developed form; the golden-leaved variety of *Ilex ovata*, the small deep green leaves, edged with gold; *Clematis viticella* *x* *uniflora*, with rosy-lilac pendent flowers, and an erect habit of growth, free-blooming; *Heliopeis Pitheriana*, deep gold, fine in colour, and of a rigid erect growth (Award of Merit); *Rosa rugosa atropurpurea*, a deep bright crimson seedling of striking character (Award of Merit); some *Gaillardias*, bunches and boxes of *Roses*, such as *H. T. Madame A. Chateau*, *Gustave Regis*, *Mrs. W. J. Grant*, *Antoine Riviere*, and *H. P. Royal Scarlet*, with bunches of hardy flowers, such as *Platycodon grandiflorum* and its white variety, *Rudbeckia purpurea*, *Acanthus longifolius*, pans of *Campanula Maritima*, and *Insula ensifolia*, &c.

Messrs. VERRICH & SON, Exotic Nurseries, Chelsea, had *Lobelia Riviere*, a delicate pink or flesh-coloured form of cardinalis; a box of cut blooms of greenhouse *Rhododendrons*, and baskets of choice shrubs, viz., *Hibiscus*, single, *Painted Lady*, white with dark centre; *H. single*, *Colestia*, pale violet-blue with crimson centre; and *H. totus albus*, pure white, each of which received an Award of Merit. In addition there were baskets of *Eucryphia pinnatifolia* with large white blossoms; *Pavia macrostachya*, two handsome variegated forms of *Acer palmatum*, *Veronica La Seduisante*, with numerous spikes of magenta-crimson flowers (Award of Merit); flowering spikes of *Spartium junceum*; *Spirea callosa atrosanguinea*, and *Cornus macrophylla*.

Messrs. F. SANDER & CO., St. Albans, had a batch of the white-flowered *Watsonia Ardeni*, *Lilium Henry*, and *L. Philippinense*, the rich blue-flowered *Exacum seylanicum* var. *macranthum*, and *Dipladenia atropurpurea*.

Mr. T. S. WARE had *Sedum maximum purpureum*, a strong growing form with deep bronzy-clarlet, thick leathery leaves; and in addition an imposing bank of hardy plants and flowers, comprising *Yucca filamentosa*, *Lilies*, *Campanula pyramidalis*, *Fraxinea*, *Aconitum*, *Carnations*, *Scabiosa caucasica*, *Chrysanthemum maximum*, &c., but few of which were named.

Messrs. BARR & SON, King Street, Covent Garden, staged two varieties of herbaceous *Phloxes*, viz., *Bouquet de St. Cyr*, white with purple-crimson centre; fine flat stout pipe, (Award of Merit); and *Leonardo de Vinci*, in much the same way, but rather paler in the centre; and in addition a bank of cut flowers, *Delphinium*, *Campanula pyramidalis* in variety, *Pentstemon*, *Montbretia*, *Hyacinthus candicans*, *Coreopsis lanceolata* and *O. grandiflora*, *Lythrum virgatum*, *Gladioli*, *Phloxes* in considerable variety, *Sweet Peas*, &c.

From Messrs. ATLER BURPEE & CO., Pennsylvania, U.S.A., came pots of Sweet Pea *Pink Cupid* in much better form than when previously produced, and in the character of dwarf compact plants well furnished with bloom, but it found no favour with the committee. This variety produces dark seeds, and is said to be of a stronger constitution than the *White Cupid*.

Messrs. HUNTER & SON, 152, Houndsditch, E.C., sent a very pretty rose-tinted form of the everlasting Pea named *Pink Beauty*, deeper in colour than the pink-striped *Delicate*, which the committee certificated some years ago.

From Messrs. W. J. STOKES & SON, Hiltop, Trowbridge, came an everlasting Pea named *Her Majesty*, which the committee regarded as identical with *Delicate*.

Messrs. H. LOW & CO., Clapton Nursery, had a group of plants of *Lilium nepalense*, and *L. Wallichianum*.

Messrs. B. HARTLAND & SON, nurserymen, Cork, sent seven large boxes of cut blooms of double and single tuberous-rooted *Begonias*, many of them of very fine quality, and the strain to all appearance equal to anything seen in this country. A very fine double yellow could be seen among them.

Messrs. DOBBIE & CO., seedsmen, Orpington and Rotham, sent a dwarf compact and exceedingly free-flowering plant of the new *Godetia Gloriosa*, deep bright crimson, a valuable addition to our summer-flowering hardy annuals (Award of Merit).

A very charming display of *Roses* in boxes and bunches came from Messrs. WILLIAM PAUL & SONS, nurserymen, Waltham Cross. It included boxes of trusses of Tea-scented

Section of vegetables, nine distinct kinds, 1st, Lady ...
Castle, Duke of Albany Pot, Beet Crimson Ball, ...
Tomato Perfection, Onion Veitch's Maincrop.

SHSHELF FLORAL, HORTICUL- TURAL AND ROSE.

77.—This Society, which is affiliated with the ...
Rose and Royal Horticultural Societies of England ...
on Tuesday on the beautiful Colliery Cricket ...
at Tishelf, which lies nearly midway between ...
and Nottingham. Prizes of the value of £360, ...
medals, by the two National Societies, were ...
and produced a keen competition, and attracted a ...
number of growers from all parts of the country. ...
worth recording that, for the first time for years, this ...
which is the first of a long list in the Peak ...
was favoured with beautifully fine weather, the sun ...
gloriously throughout.

one of the features is always the groups of plants arranged ...
effect, to cover 200 ft., the 1st prize for which is £15. Nine ...
were offered, but the competition was not quite as ...
usual. Mr. Joseph Ward, gr. to Mr. T. Hoakes, J.P., ...
Huddings House, Derbyshire, was again 1st, a position he ...
occupied almost continuously for many years. It was a ...
fantastic collection, the colouring being most delightful, ...
the whole very effective. It contained chiefly Aloca- ...
Crotone, Lillums, Anthuriums, and Cocos. An amateur, ...

WILLIAM SHAKESPEARE, who has gradually risen to an ...
position in Derbyshire, was very rightly placed 2nd ...
a group slightly less in size, but furnished quite as well ...
gr. Ward's. Mr. T. J. Nelson, gr. to Mr. A. BARNES, J.P., ...
Lodge, Chesterfield, was 3rd with a nice collection, ...
however, lacked the colouring of the two preceding ...
which contained most of the same kind of plants.

W. J. WARD easily occupied the premier position for ...
six plants for dinner-table, vase of Ferns, Pines, ...
(black), Peaches, Nectrines, Melons, collection of ...
Tomatoes red, ditto yellow, ditto red or yellow, Celery ...
Vegetable Marrows, and a collection of vegetables. ...
there is added to this a few 2nds it will be admitted ...
Huddings House Gardens quite maintained their ...

W. BUTLER stood by himself with zonal and ...
Pelargoniums and Verbenas; and came in for a ...
of 2nd.

W. SHAKESPEARE got 1sts for show Pelargoniums and ...
Lilies.

W. KEMP, J. DORE, PRICE, and J. W. PLAWMAN ...
the remaining cards in the open class.

were not quite so numerous as in previous years, and ...
were no new varieties brought out. The hot, dry ...
apparently had left its mark on southern growers ...
some often conspicuous here were absent. The heavy ...
storms during the past week had not improved ...
in the Midlands, and many of them were badly ...
thundered; still, there was a grand show, and a keen ...
competition, especially between Messrs. HARKNESS, of Bedale, ...
D. MACK & SON, Catterick; and Mr. H. DICKSON, ...
Belfast, who was handicapped by the distance his blooms ...
were brought.

MESSRS. HARKNESS & SON secured the National Rose ...
Society's Gold Medal for the best seventy-two blooms, the ...
Medal for the best forty-eight blooms, and the Royal ...
Society's Medal for thirty-six blooms. The ...
Horticultural Society's Medal went to Mr. W. BOYES, ...
Loughborough; and Messrs. MERRYWEATHER, of South- ...
Hampshire, Nottingham, was awarded a special for ...
five blooms. The Rose awards were:—

One and Noisette Roses, eighteen varieties.—1st, D. & W. ...
DUNDEE; 2nd, Mr. W. BOYES; 3rd, HARKNESS & SON. ...
Seventy-two blooms, 50 distinct varieties.—1st, HARKNESS & ...
2nd, D. MACK & SON.

Forty-eight blooms, distinct varieties.—1st, HARKNESS & ...
2nd, H. DICKSON.

Thirty-six blooms, distinct.—1st HARKNESS & SON; 2nd, ...
MACK & SON.

Twenty-four blooms.—1st, W. BOYES; 2nd, R. PARKES.

Eighteen distinct varieties.—1st, M. WHITTLE; 2nd, R. E. ...
EST.

Twelve distinct varieties.—1st, M. WHITTLE; 2nd, S. PRICE. ...
There were six other classes, and the exhibits filled three ...
ge marquees.

The Society, whose income last year was £406 9s. 11d., ...
£25 2s. in hand to carry forward. Considering that the ...
was fine, it is believed that this balance will be much ...
reached.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending July 24, is furnished from the Meteorological Office:—

"The weather during this week has been very changeable, fine and dry conditions having alternated with heavy local rains and sharp thunderstorms.

"The temperature exceeded the mean in all districts excepting 'England, N.E.,' the excess ranging from 3° in most districts to 4° in 'Scotland, N.' The highest of the maxima were registered either on the 18th or 24th, and ranged from 89° in 'England, E.,' 84° in the 'Midland Counties,' and 83° in 'England, S.,' to 77° in 'Scotland, W.,' and 75° in 'Ireland, S.' The lowest of the minima were recorded during the earlier days of the period, and varied from 40° in 'Scotland, W.,' and 42° in 'England, E.,' to 51° in 'England, S.,' and 57° in the 'Channel Islands.'

"The rainfall varied greatly in different parts of the kingdom, and even in different parts of the various districts. On the north side of London there was a particularly heavy fall of hail and rain on the 21st. The totals were rather more than the mean over Ireland, 'England, S.W.,' the 'Midland Counties,' and 'Scotland, E.,' but less than the mean elsewhere.

"The bright sunshine exceeded the mean at most of the northern, eastern, and southern stations, but showed a deficiency in most of the western districts. The percentage of the possible duration ranged from 53 in 'England, E.,' 49 in the 'Channel Islands,' and 46 in 'England, S.,' to 22 in 'England, S.W.,' 17 in 'Ireland, N.,' and 16 in 'Ireland, S.'"

THE FLOWER GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Carnations and Picotees.—The propagation of these plants should be taken in hand forthwith; and although they may be easily struck from cuttings in frames on hotbeds, the simplest method is to layer them in the open ground. The flowering this year being generally later than usual, no time should be lost in getting the layering finished as soon as possible, so as to obtain strong plants by planting-time. Previous to beginning to layer, slightly loosen the surface-soil round the plants with a handfork, make a sufficient number of hooks from Birch, bracken-stems, wire, &c., about 5 inches in length; and provide

a quantity of sifted moderately light soil for putting around the layers, so as to hasten the formation of roots. For this purpose the refuse of the potting-bench, mixed with a small quantity of loam a year or longer in stack, and well-rotted leaf-mould, make a very suitable mixture. If the shoots on a plant are many, the upright growths in the centre of the plant should be left untouched, and about six of the outer and more-conveniently-placed shoots used as layers. From these strip off the bottom leaves, so as to leave a bare space of 2 to 4 inches, and with a sharp knife cut half-way through the shoot on its lower side, and just below a joint or node, and passing the blade upwards through one or two joints, open the "tongue" thus made, and press the shoot gently into the soil, so as to keep the parts separated, and fix the shoot in an erect position, with a hook pressed home firmly but gently on to the stem. Place the prepared soil around each plant, so as to form a saucer-like depression, and snip off the points of every shoot that has been layered. Where the old plants are rather closely planted, the entire surface of the bed may be covered with soil, and layering and rooting greatly facilitated. Apply water, and sprinkle the layers if the day has been bright, and rain is not imminent. The layers should be fit for planting in pots or the open border in about eight weeks from the time of layering.

Alstroemerias.—Tuberous-rooted perennials which, if planted deeply in good soil that has been trenched 2 to 3 feet deep, and dressed at several depths with rotten dung, afford large quantities of beautiful flowers for many years without any further attention than a yearly top-dressing, or a heavy watering with mild liquid-manure whilst in the height of their growth. The plant does best in a sandy-loam and a warm position, and the roots being not less than 1 foot below the surface are safe from frost. The cut blooms last long in water, making them invaluable for room decoration. A variety named Bertha with flowers of a pinkish tinge has been in flower at Dropmore for some weeks; the plant has stems 15 to 18 inches high. A. aurea is a taller grower, a valuable Chilean species with orange-coloured blooms; A. psittacina is a pretty species with scarlet and green flowers; A. pelegrina, A. p. alba, A. versicolor, and A. bœmantha are all very desirable species. The roots of the Alstroemeria should be purchased or obtained early in the autumn, potted up and stood in a cold frame through the winter, and planted out in good and well-drained ground in the spring to become established. Small pieces turned out of 6-inch pots three years ago have now made fine clumps, and become very effective in the borders.

Border Chrysanthemums will require copious supplies of water, otherwise the foliage will become yellow and unsightly and the flowers poor. Some varieties, especially Flora, are already in flower. If cut, these plants break readily from below, and will produce a good supply of blooms later.

MARKETS.

COVENT GARDEN, JULY 29.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

Enchantress, Empress Alexander of Russia, Sylph and Madame Sablayrolles; also fine bunches of Nabonnand, pale ground flushed with rose, a very free flowering and most useful garden Rose (Award of Merit), Madame Chateaucy, Francois, Duboull, Souvenir de Madame Levot, Souvenir de Lady Ashburton, Souvenir de President Carnot, a most interesting exhibit.

Messrs. CHAL & SON, Longfield Nursery, Crawley, had boxes of cut blooms of Cactus, Pompon and single Dahlias in fine character, showing that the Dahlia season is near at hand.

Mr. H. B. MAY, Dyson's Lane Nurseries, Edmonton, staged a characteristically fine display of Ferns in great variety, and showing skilful cultivation.

From Messrs. H. CANNELL & SONS, Home of Flowers, Swanley, came an extensive collection of Cacti, Echinocacti, &c., similar in regard to species and varieties to what this firm showed last year about this date.

Mr. WRIGHT, Superintendent of the Royal Horticultural Society's Garden, made a very obviously required innovation in the arrangement of the exhibits, in placing a quantity of plants from Mr. H. J. JONES, Ryecroft Nursery, Lewisham, as a long group of irregular outline on the floor of the hall, in place of the usual central table; and most of the plants of which it consisted being under 4 feet in height, it allowed them to be inspected very readily—moreover, the effect was decidedly pleasing. The group was mainly made up of tuberous Begonias, Lilies, Ferns, small Palms, &c. An award of a Gold Medal was made.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. M. Pollett, H. Ballantine, F. W. Moore, F. J. Thorne, W. H. Young, H. J. Chapman, E. Ashworth, E. Hall, W. Cobb, and S. Courtland.

Messrs. JAMES VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, exhibited a new and very remarkable hybrid raised by them, viz., *Epilaelia* × *radiceo-purpurata* (*Epidendrum radicans* ♂, *Laelia purpurata* ♀), which, like the *Epilaelia* × *matutina*, retains the habit of the male parent. The flowers, which in a great degree resembled those of *Epiphronitis Veitchii*, are about 2 inches at their greatest width; the sepals and petals of a pretty light orange-scarlet; the broadly-ovate lip clear yellow at the base, the outer zone being light purple. The remarkable cross was awarded a First-class Certificate.

Messrs. VEITCH also showed *Epidendrum radicans*, one of the parents of the hybrid; the pretty light rose *Phalenopsis* × *Hebe* (*Sanderiana* × *rosea*); *Laelio-Cattleya* × *Clonia*, of very fine form and rich colour; *Cattleya* × *Atalanta* (*Leopoldi* ♂, *Warszewiczii* ♂), a very handsome flower with light rose-coloured sepals and petals, the former tinged with buff; and soft purplish rose labellum; and *Sobralia* × *Veitchii*, a very delicately tinted blush-white flower with clear yellow centre.

ELIJAH ASHWORTH, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. Holbrook), was awarded a Silver Flo a Medal for a splendid collection of cut spikes of *Cattleyas*, among which were sixteen very fine forms of *C. Warszewiczii*, chiefly of the very dark crimson-lipped strain; some *C. Mendellii*, of which *C. M. delicata* was an almost wholly white form; *C. Rex*, and *Laelio-Cattleya* × *Schilleriana*.

Mr. ASHWORTH also showed a plant in flower of *Cattleya Warszewiczii*, "Mrs. E. Ashworth," one of the most distinct and delicate forms yet seen. Its flower is fine in size and shape, and, lip included, almost wholly of a delicate bluish-white tint, the only other colour being a yellow tinge in the centre, and a very slight lilac mark in front of the lip (Award of Merit).

Messrs. HUGH LOW & CO., Clapton, staged a small group composed of two fine *Cattleya Warszewiczii*, the one with five and the other with six flowers on a spike; *C. Gaskelliana* Sunray, a very pretty variety with purple feather on the petals and lower sepals; *Odontoglossum crispum rotundiflorum*, a good flower with a few cinnamon-brown blotches; *Cypripedium* × *Brilliant*, much resembling *C. × Alfred Hollington* (*elliptica* × *philippinense*); *C. × Chas. Canham*, and *C. × cananthum superbum*; also, their *Bulbophyllum Claptonense*.

Messrs. F. SANDER & CO., St. Albans, showed *Angraecum Elchlerianum*, Vanilla-like in growth, and bearing solitary flowers of good size, with white labellum bearing a green spur; and pale green sepals and petals. *Miltonia vexillaria rubella melanocentra*, having the small flowers of rubella, but with remarkably rich dark markings on the lip; *Vanda Hookeriana*, *Bifrenaria aurantiaca*, and the singular *Masdevallia Gargantua*.

Frau IDA BRANDT, Riesbach, Zurich (gr., Mr. Schlecht), sent cut examples of *Odontoglossum Schleiperianum* citrinum, *Epidendrum raniflorum*, *E. coelestium*, *Colax jugosus*, *Cattleya Rex*, *Trichocentrum porphyreum*, &c.

Major JOICEY, Sunningdale Park, Sunningdale (gr., Mr. Fred. Thorne), sent *O. longissimum* Schleiperianum with three strong spikes; *O. s. citrinum*, and the elegant *O. aspidorhinum*, Lehmann, with three fine spikes.

J. H. KITSON, Elmet Hall, Leeds (gr., Mr. Bonsall), showed *Cypripedium leucocentrum*, like a form of *C. bellatulum*, but with white lip.

J. F. ERNER, Esq., Woodlands, Beckenham (gr., Mr. A. Waite), showed *Cypripedium* × *Chapmani* (*bellatulum* × *Curtisii*), a very fine hybrid, recently exhibited on several occasions by the raiser, Mr. H. J. Chapman, gr. to R. I. Measures, Esq., who received a First-class Certificate for it.

Fruit and Vegetable Committee.

Present: P. Crowley, Esq., Chairman; Rev. W. Wilks, Secretary; and Messrs. J. Cheal, A. F. Barron, Saltmarsh, James Veitch, G. W. Cummins, A. Dean, W. Bates, W. Farr, G. H. Sage, G. Wythes, F. Q. Lane, J. Smith, Robert Fife, J. Willard, and W. J. Empson.

Messrs. J. VEITCH & SONS sent fruits of Nectarine Précoce de Crocels from pot plants grown in a cool-house, not large, but well-coloured, and of fair flavour; flesh somewhat clinging to the stone. It is undoubtedly early, but seems to be best when assisted by heat. An Award of Merit was granted on a show of hands by seven votes against five.

Huge samples of Sea Eagle Peach came from Mr. D. McAINSH, Leeds Castle Gardens, Maidstone. The variety favours Noblesse in shape and paleness, but is not a high-class variety. It seems, so far, not to have received any award, although a long time in commerce. A Cultural Commendation was given.

Mr. J. TAYLOR, Hardwicke Grange, Shrewsbury, sent seedling Melon Hardwicke Beauty, handsome and yellow, with thick soft scarlet flesh. The fruit seemed to have been kept several days, and, though of good flavour, yet was a little flat. It was agreed a fresh cut fruit should be asked for at a later meeting. The one sent bore great resemblance to Blenheim Orange.

A Melon was sent by Mr. James Hudson, gr. to the Messrs. ROTHSCHILD, Gunnersbury House. It was very long, oval in shape, of fair size, and handsome, also scarlet-fleshed. It was the product of a cross between Golden Perfection and Blenheim Orange. The fruit proved not to be in good condition.

Mrs. CUNDEY, Warren House, Cobham, sent bunches of the Japanese Wine-berry.

Messrs. W. J. STOKES & SONS, Trowbridge, sent fine pods of a Pea named Hero of Trowbridge, not unlike Duke of Albany. It was said to have been previously grown at Chiswick.

Messrs. KELWAY & SONS, Langport, had dishes of Bunyard's Exhibition Longpod Bean and Duke of Albany Pea, very fine samples. A Vote of Thanks was given.

Messrs. JAS. CARTER & CO. staged a collection of eighteen varieties of garden Turnips; some of the samples were rather old, but so far these roots have been universally of indifferent quality. The best were, of whites, Early Model, Jersey Lily, and Stone; the Red-top Stone was the best of its section. Golden Ball of the yellows, and the red Radish Turnip, Cardinal, was also represented. Several of the varieties were of the Early Dutch or Milan form, and too flat to find popular favour.

Messrs. JAS. VEITCH & SONS sent a splendid and most instructive collection of 100 varieties of Gooseberries, all set up in square shallow boxes lined with leaves. They presented a capital representation of all the best varieties in commerce, and included, of reds, large Clayton, Rough Red, Iskander Bey, Conquering Hero, Crown Bob, Industry, Dan's Mistake, Lion's Provider, Speedwell, and others. Of greens, Telegraph, Surprise, Peerless, Ransom, Gretna Green, and Tom Joiner. Of yellows, Coiner, Mount Pleasant, Trumpeter, High Sheriff, Broom Girl, Pretty Boy, Gipsy Queen, and Railway; and of whites, Progress, Eve, and Whitesmith. Of small, highly-flavoured varieties the best were, Ironmonger, Champagne, and Keen's Seedling, red; Pittmaster Green Gage, Early Green Hardy and Green Walnut, and of yellows Golden Drop, Yellow Smith, and Yellow Champagne. The firm also showed fine Negro Largo Figs, Morello Cherries, Transparent White, White Dutch, and the finer White Dutch cut-leaf Currants, and La Constante, La Versaillaise, Warner's Grape, and other Red Currants. A Silver-gilt Knightian Medal was to this collection unanimously awarded.

Mr. G. WYTHES sent from Syon Gardens Pear St. Swithun, like the old Windsor in form, but worthless for table; and Apples, Irish Peach and Red Quarrendon for the flavour competition, but no award was made.

TRENTHAM AND HANFORD HORTICULTURAL.

JULY 22.—The ninth, and hitherto the best show of the above society, was held in Trentham Gardens on the above date. The Duchess of Sutherland, the Dowager Countess ROSELYN, and a numerous house party, graced the proceedings by their presence, and visitors came in thousands.

The Roses were superb and numbered several thousands. The Tea Roses were declared by the judges to be the best they had seen this season. The Very Rev. Dean Hole of Rochester acted as judge of the Roses, having been specially invited by the Duchess of Sutherland for the occasion.

The show of fruit was large and good; and the dinner-tables arranged with flowers and fruit have seldom been equalled at any exhibition. The competition was so keen that the Royal Horticultural Society's standard of judging by points had to be strictly followed out, even with this help there was very little between the 1st, 2nd, and 3rd.

Of the groups of plants arranged for effect, six competitors brought together and arranged very fine groups.

The non-competitive exhibits were numerous. Mr. Goodacre, gr. to the Earl of HARRINGTON, Elvaston Castle, Derby, put up a fine group of magnificent Souvenir de la Malmaison Carnations, in light and dark coloured varieties, consisting of fifty plants, carrying about 500 blooms, the group being backed with Bamboos, and edged with Maiden-hair Ferns. A Silver Medal was awarded.

Silver Medals were also awarded to HENRY ECKFORD, Wem, Salop, for fifty varieties of Sweet Peas, including the new Duchess of Sutherland, Lady Muriel Hamilton, La Skelmersdale, and Colonelist, all good and distinct. To Messrs. WALLACE & CO., Colchester, for a fine collection of Lilies; Messrs. PATCHARD & SONS, Shrewsbury, for fifty varieties of Carnations; to Messrs. DICKSONS & SONS, Chester, sixty-five bunches of cut flowers, and several boxes of Rose to Mr. J. H. WHITE, Worcester, for fifty varieties of herbaceous plants, twenty bunches of border Carnations, a twenty varieties of Sweet Peas; to Messrs. J. LAISO & SON, Forest Hill, London, for a grand collection of Begonia Caladiums, Sweet Peas, and Carnations; to Messrs. WESS SONS, Stourbridge, for a collection of vegetables; to Messrs. JONES & SONS, Shrewsbury, for Sweet Peas, effective shown in baskets, and Cactus Dahlias; to Messrs. EDWARDS & SON, Shrewsbury, for ornamental stands and Ferns.

The show of cottagers' produce was exceptionally good. The Duchess of SUTHERLAND, in opening the show, made special reference to this section.

Group of miscellaneous plants, in or out of bloom, arranged for effect, occupying 300 square feet, 1st, Mr. C. J. M. Sherwood, Notts, whose group contained Kentias, Sugarcanes, fine Crotons, Bamboos, Pitcher-plants in variety, Alocasias, Orchids in variety, some fine *Odontoglossum* Anthuriums in variety, Begonias, and a good number of the alpine-bead plant, *Nertera depressa*, Ferns, &c.; 2nd, Messrs. J. JENKINS & SONS, Newcastle, Staffordshire, whose group contained a number of *Phalenopsis* and *Cattleyas*; 3rd, Duke of ST. ALBANS.

Class 2, open to persons who do not employ more than one gardener: 1st, Mr. F. J. MADDOCK, Alsayer; 2nd, Mr. C. JONES, Stoke.

Roses, forty-eight distinct, single blooms, 1st, Messrs. HARKNESS & SONS, Bedale, whose stand contained excellent blooms; 2nd, Messrs. A. DICKSON & SONS, Newtownards.

There were numerous other classes for Roses, the enumeration of which would be tedious.

FRUIT AND VEGETABLES.

Decorated table, with ripe fruit, not to exceed six dishes, and not fewer than ten, and not more than two distinct varieties of a kind, each table to be covered with white cloth; silver, electro-plated wine-glasses and decanters excluded.—1st, Sir J. W. PEASE, Bart., Hutton Hall (gr. Mr. McIndoe, whose arrangement of the exhibit, and the quality, have seldom been equalled. The flowers consisted of small bright-coloured Carnations and Plectranthus with Asparagus and Pancratiums. The fruit comprised Black Hamburg Grapes, large both in bunch and berry, and well coloured; two well-grown bunches of Chasselas Napoleon, highly coloured; a well-ripened truss of Pananas, a good Pine-apple, Scarlet Melon, Alexander Noblesse and Grosse Mignonne Peaches Stanwick Elruge, and Spencer Nectarines; Souvenir de Congrès Pears, Negro Largo and Brown Turkey Figs, Prime Englebert Plums, Gunton Park Strawberries, and Duchess of Gloucester Apples. 2nd, Earl of HARRINGTON (gr. Mr. Goodacre), whose collection consisted of Souvenir de la Malmaison Carnations, beautifully arranged; good Black Hamburg and Muscat of Alexandria Grapes, two Melons, fine Noblesse and Bellegarde Peaches, Lord Napier and Pine-apple Nectarines, Elton Pine and Waterloo Strawberries, Brown Turkey Figs, Beauty of Bath and Red Astrakhan Apples, and a good Queen Pine, and McLaughlin's Gage Plum; 3rd, Duke of ST. ALBANS, whose exhibit was a very fine one.

Collection of six kinds of fruit.—1st, Sir J. W. PEASE, Bart., with fine Muscat of Alexandria and Black Hamburg Grapes, Negro Largo Figs, Spencer Nectarines, Early Transparent Gage Plums, and Alexandria Noblesse Peaches; 2nd, Lady HENRY SOMERSET (gr. Mr. F. Harris). No fewer than seven competitors staged in this class, and all good.

Of Grapes, the exhibits were excellent. For four bunches, two distinct varieties, 1st, Baron ROTHSCHILD (gr. Mr. Reynolds), Gunnersbury Park, who staged grand Black Hamburgs and Madresfield Court, finely finished; 2nd, Lord BAGOT (gr. Mr. Bunneman), with Duke of Bucklebury and Black Hamburg.

Grapes, three bunches, Black Hamburg.—1st, W. D. Lowe, Esq., Derby; 2nd, Baron ROTHSCHILD.

Grapes, three bunches, black, any other variety.—1st, Baron ROTHSCHILD, with Madresfield Court; 2nd, J. C. WATERHOUSE, Esq.

Grapes, three bunches, Muscat of Alexandria.—1st, Baron ROTHSCHILD; 2nd, Lord BAGOT.

Grapes, white, three bunches, any other variety, 1st, Baron ROTHSCHILD; 2nd, Lord BAGOT.

Grapes, two bunches, black and white, 1st, Baron ROTHSCHILD; 2nd, Lord BAGOT.

Melon, green or white-fleshed, 1st, Earl of HARRINGTON with Countess.

Melon, scarlet-fleshed, 1st, B. T. FITZHERBERT, Swynerton Park (gr. Mr. Turner), with Royal Ascot.

Peaches, dish of six, 1st, Lady HENRY SOMERSET, with Bellegarde; 2nd, Earl of HARRINGTON, with same variety.

Nectarines, dish of six, 1st, Sir J. W. PEASE, with Spencer; 2nd, Baron ROTHSCHILD, with Stanwick Elruge.

Strawberries, dish of thirty six, 1st, Lord BARNARD, with James Veitch; 2nd, Duke of SUTHERLAND, with Waterloo.

Dish, twelve Tomatos, 1st, J. McPHAIL, with Comet; 2nd, Duke of ST. ALBANS.

Cherries, dish of fifty, 1st, Lady H. SOMERSET; 2nd, Baron ROTHSCHILD.

Cucumbers, brace, 1st, Lord BAGOT; 2nd, J. C. WATERHOUSE.

Collection of vegetables, nine distinct kinds, 1st, Lady THEODORA GUEST (gr., Mr. Wilkins), who staged fine Potato Windsor Castle, Duke of Albany Pear, Beet Crimson Ball, Magnum Bonum Cauliflower, Cucumber Progress, Carrots New Red, Tomato Perfection, Onion Veitch's Maincrop.

Collection of vegetables, nine distinct kinds, the produce seeds supplied by Sutton & Sons, 1st prize the Sutton Cup, Lady THEODORA GUEST.

Vegetables, six distinct kinds, prizes offered by James Carter & Co., 1st, Lady THEODORA GUEST.

Collection of Vegetables, six distinct kinds, prizes offered by Messrs. Webb & Sons, 1st, W. NICHOLSON.

In the section devoted to Amateurs and Cottagers, a fine collection of flowers, fruits and vegetables were staged, which received full attention from the vast number of visitors to the show.

TIBSHLEF FLORAL, HORTICULTURAL AND ROSE.

JULY 27.—This Society, which is affiliated with the National Rose and Royal Horticultural Societies of England was held on Tuesday on the beautiful Colliery Cricket ground at Tibshelf, which lies nearly midway between Chesterfield and Nottingham. Prizes of the value of £360, and medals, and medals, by the two National Societies, were offered, and produced a keen competition, and attracted a tremendous number of growers from all parts of the country. It is worth recording that, for the first time for years, this exhibition, which is the first of a long list in the Peak county, was favoured with beautifully fine weather, the sun shining gloriously throughout.

One of the features is always the groups of plants arranged for effect, to cover 200 ft., the 1st prize for which is £15. Nine prizes were offered, but the competition was not quite as keen as usual. Mr. Joseph Ward, gr. to Mr. T. HOAKES, J.P., of Riddings House, Derbyshire, was again 1st, a position he has occupied almost continuously for many years. It was a light fantastic collection, the colouring being most delightful, and the whole very effective. It contained chiefly Alocasia, Crotons, Lilliums, Anthuriums, and Cocos. An amateur, Mr. WILLIAM SHAKESPEARE, who has gradually risen to an eminent position in Derbyshire, was very rightly placed 2nd with a group slightly less in size, but furnished quite as well as Mr. Ward's. Mr. T. J. NELSON, gr. to Mr. A. BARNES, J.P., of Ashgate Lodge, Chesterfield, was 3rd with a nice collection, which, however, lacked the colouring of the two preceding though containing most of the same kind of plants.

Mr. J. WARD easily occupied the premier position for Ferns, six plants for dinner-table, vase of Ferns, Pines, roses (black), Peaches, Nocturnes, Melons, collection of 1, Tomatoes red, ditto yellow, ditto red or yellow, Celery (red), Vegetable Marrows, and a collection of vegetables. When there is added to this a few 2nds it will be admitted that Riddings House Gardens quite maintained their reputation.

Mr. W. BUTLER stood by himself with zonal and variegated Pelargoniums and Verbenas; and came in for a sprinkling of 2nds.

Mr. W. SHAKESPEARE got 1st for show Pelargoniums and Fuchsias.

Messrs. W. KEMP, J. DORE, PRICE, and J. W. FLOWMAN divided the remaining cards in the open class.

Roses were not quite so numerous as in previous years, and there were no new varieties brought out. The hot, dry summer apparently had left its mark on southern growers and some often conspicuous here were absent. The heavy thunder-storms during the past week had not improved matters in the Midlands, and many of them were badly weathered; still, there was a grand show, and a keen competition, especially between Messrs. HARKNESS, of Bodale, Yorks; D. MACK & SON, Catterick; and Mr. H. DICKSON, of Belfast, who was handicapped by the distance his blooms were brought.

Messrs. HARKNESS & SON secured the National Rose Society's Gold Medal for the best seventy-two blooms, the Silver Medal for the best forty-eight blooms, and the Royal Horticultural Society's Medal for thirty-six blooms. The other Horticultural Society's Medal went to Mr. W. BOYES, of Loughborough; and Messrs. MERRYWEATHER, of Southwell Nurseries, Nottingham, was awarded a special for twelve blooms. The Rose awards were:—

Ten and Noisette Roses, eighteen varieties.—1st, D. & W. COLL, Dundee; 2nd, Mr. W. BOYES; 3rd, HARKNESS & SON. Seventy-two blooms, 50 distinct varieties. 1st, HARKNESS & SON; 2nd, D. MACK & SON.

Forty-eight blooms, distinct varieties.—1st, HARKNESS & SON; 2nd, H. DICKSON.

Thirty-six blooms, distinct.—1st, HARKNESS & SON; 2nd, R. MACK & SON.

Twenty-four blooms.—1st, W. BOYES; 2nd, R. PARKER.

Eighteen distinct varieties.—1st, M. WHITTLE; 2nd, R. E. WEST.

Twelve distinct varieties.—1st, M. WHITTLE; 2nd, S. PRICE. There were six other classes, and the exhibits filled three large marquees.

The Society, whose income last year was £406 8s. 11d., had £3 2s. in hand to carry forward. Considering that the day was fine, it is believed that this balance will be much increased.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending July 24, is furnished from the Meteorological Office:—

"The weather during this week has been very changeable, fine and dry conditions having alternated with heavy local rains and sharp thunderstorms.

"The temperature exceeded the mean in all districts excepting 'England, N.E.,' the excess ranging from 3° in most districts to 4° in 'Scotland, N.' The highest of the maxima were registered either on the 18th or 24th, and ranged from 86° in 'England, E.,' 84° in the 'Midland Counties,' and 83° in 'England, S.,' to 77° in 'Scotland, W.,' and 75° in 'Ireland, S.' The lowest of the minima were recorded during the earlier days of the period, and varied from 40° in 'Scotland, W.,' and 42° in 'England, E.,' to 51° in 'England, S. and S.W.,' and to 57 in the 'Channel Islands.'

"The rainfall varied greatly in different parts of the kingdom, and even in different parts of the various districts. On the north side of London there was a particularly heavy fall of hail and rain on the 21st. The totals were rather more than the mean over Ireland, 'England, S.W.,' the 'Midland Counties,' and 'Scotland, E.,' but less than the mean elsewhere.

"The bright sunshine exceeded the mean at most of the northern, eastern, and southern stations, but showed a deficiency in most of the western districts. The percentage of the possible duration ranged from 53 in 'England, E.,' 49 in the 'Channel Islands,' and 46 in 'England, S.,' to 22 in 'England, S.W.,' 17 in 'Ireland, N.,' and 16 in 'Ireland, S.'"

THE FLOWER GARDEN.

By CHARLES HERBIN, Gardener, Dropmore, Maidenhead.

Carnations and Picotees.—The propagation of these plants should be taken in hand forthwith; and although they may be easily struck from cuttings in frames on hotbeds, the simplest method is to layer them in the open ground. The flowering this year being generally later than usual, no time should be lost in getting the layering finished as soon as possible, so as to obtain strong plants by planting-time. Previous to beginning to layer, slightly loosen the surface-soil round the plants with a handfork, make a sufficient number of hooks from Birch, bracken-stems, wire, &c., about 5 inches in length; and provide

a quantity of sifted moderately light soil for putting around the layers, so as to hasten the formation of roots. For this purpose the refuse of the potting-bench, mixed with a small quantity of loam a year or longer in stack, and well-rotted leaf-mould, make a very suitable mixture. If the shoots on a plant are many, the upright growths in the centre of the plant should be left untouched, and about six of the outer and more-conveniently-placed shoots used as layers. From these strip off the bottom leaves, so as to leave a bare space of 2 to 4 inches, and with a sharp knife cut half-way through the shoot on its lower side, and just below a joint or node, and passing the blade upwards through one or two joints, open the "tongue" thus made, and press the shoot gently into the soil, so as to keep the parts separated, and fix the shoot in an erect position, with a hook pressed home firmly but gently on to the stem. Place the prepared soil around each plant, so as to form a saucer-like depression, and snip off the points of every shoot that has been layered. Where the old plants are rather closely planted, the entire surface of the bed may be covered with soil, and layering and rooting greatly facilitated. Apply water, and sprinkle the layers if the day has been bright, and rain is not imminent. The layers should be fit for planting in pots or the open border in about eight weeks from the time of layering.

Alstromerias.—Tuberous-rooted perennials which, if planted deeply in good soil that has been trenched 2 to 3 feet deep, and dressed at several depths with rotten dung, afford large quantities of beautiful flowers for many years without any further attention than a yearly top-dressing, or a heavy watering with mild liquid-manure whilst in the height of their growth. The plant does best in a sandy-loam and a warm position, and the roots being not less than 1 foot below the surface are safe from frost. The cut blooms last long in water, making them invaluable for room decoration. A variety named Bertha with flowers of a pinkish tinge has been in flower at Dropmore for some weeks; the plant has stems 15 to 18 inches high. A. aurea is a taller grower, a valuable Chilian species with orange-coloured blooms; A. peittacina is a pretty species with scarlet and green flowers; A. pelegina, A. p. albida, A. versicolor, and A. hemantha are all very desirable species. The roots of the Alstromeria should be purchased or obtained early in the autumn, potted up and stood in a cold frame through the winter, and planted out in good and well-drained ground in the spring to become established. Small pieces turned out of 6-inch pots three years ago have now made fine clumps, and become very effective in the borders.

Border Chrysanthemums will require copious supplies of water, otherwise the foliage will become yellow and unsightly and the flowers poor. Some varieties, especially Flora, are already in flower. If out, these plants break readily from below, and will produce a good supply of blooms later.

MARKETS.

COVENT GARDEN, JULY 29.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOES.

Supplies moderate; demand limited on account of warm weather. Present prices 75s. to 100s. John Bath, Wellington Street, Covent Garden.

SEEDS.

LONDON: July 28.—Messrs. John Sear & Sons, Seed Merchants, of Great Malton, Borough, London, S.E., write that to-day's seed market was barely attended, but few transactions passing. Trifolium continues cheap and abundant. Moderate prices are asked for New Trefoil. Sowing White Mustard is in somewhat improved request. New home-grown Rape-seed and Rye are now offering. The trade for bird-seed is dull and unchanged. Haricot Beans keep steady. As regards Wisconsin green boiling Peas, cables from America report a substantial advance in values. Linseed is firm.

FRUIT AND VEGETABLES.

GLASGOW: July 28.—The following are the averages of the prices current here during the past week:—Apples, 6d. per pound; Tomatos, Guernsey, 6d. to 8d. do.; do. Scotch, 10d. do.; Grapes, home, 2s. to 3s. do. Vegetables: Turnips, French, white, 1s. to 1s. 3d. per bunch; do., white, 4s. to 6s. per dozen bunches; do., French, 9d. to 10d. per bunch; Carrots, French, new, 10d. to 1s. per bunch; do., Dutch, 1s. to 1s. 6d. per dozen bunches; Cabbages, Scotch, 9d. to 1s. per dozen; do., Dublin, 9d. to 1s. 3d. per dozen; Cauliflowers, Dublin, 3s. to 3s. 6d. do.; Herbs, assorted, 1d. to 2d. per bunch; Mint, green, 6d. per bunch; Onions, Globe, 7s. per cwt.; Potatoes, best, 6d. per stone; Carrots, 2s. 9d. to 3s. per stone; Peas, French, 1s. 6d. to 1s. 9d. per basket; Asparagus, French, 1s. 6d. to 1s. 9d. per bunch; do., English, 2s. to 2s. 6d. do.; Cucumbers, 4s. to 5s. per dozen; Lettuce, round, 9d. do.; do., Cos, 9d. to 1s. do.; Radishes, 4d. to 9d. per dozen bunches; Horseradish, 2s. 3d. to 2s. 6d. per bunch; Mushrooms, 1s. per lb.; Beetroot, 7d. to 9d. per dozen; Spinach, 2s. per stone; Rhubarb, 1s. 6d. to 2s. per cwt.

LIVERPOOL: July 28.—Average of the prices at undernoted markets:—North H-y: Potatoes, Early Regent, 2s. 9d. to 3s. 4d. per cwt.; do. kidneys, 4s. to 5s. 6d. do.; Turnips, 4d. to 6d. per dozen bunches; Swedes, 2s. to 2s. 6d. per cwt.; Carrots, 6d. to 7d. per dozen bunches; Onions, foreign, 6s. 6d. to 7s. 6d. per cwt.; Parsley, 4d. per dozen bunches; Lettuces, 4d. to 6d. per dozen; Cucumbers, 1s. 6d. to 1s. 9d.; Cauliflowers, 8d. to 1s. 6d. per dozen; Cabbages, 6d. to 1s. 4d. do.; Peas, 1s. 9d. to 2s. per bushel; Beans, 1s. to 1s. 3d. do. St. John's: Potatoes, 10d. to 1s. per peck; Peas, 10d. to 1s. per peck; Cucumbers, 3d. to 6d. each; Apricots, 1s. per dozen; Gooseberries, 8d. to 4d. per lb.; Currants,

red, 6d. per lb.; Currants, black, 6d. to 8d. do.; Grapes, English, 1s. 6d. to 2s. 6d. per lb.; do., foreign, 6d. to 8d. do.; Pines, English, 6s. to 8s. each; do., foreign, 1s. each; Cherries, 6d. to 8d. per lb.; Mushrooms, 1s. to 1s. 6d. do.; Birkenhead: Potatoes, 1s. 4d. to 1s. 6d. per peck; Peas, 6d. to 1s. 4d. do.; Cucumbers, 2d. to 4d. each; Gooseberries, 3d. to 4d. lb.; Currants, red, 4d. to 6d. do.; do., black, 3d. do.; Grapes, foreign, 4d. to 8d. do.; Cherries, 6d. to 8d. do.; Mushrooms, 1s. to 1s. 4d. do.

NOTICES TO CORRESPONDENTS.

* * * Owing to the pressure on our space, several reports of important shows, and other matter, are held over till next week.

ANTIRRHINUMS: J. P., Great Warley. The plants are attacked by a fungus called *Uvularia destructiva*. Spray with solution of potassic-sulphide. 1 oz. to 3 gallons of water. G. M.

ASTER: R. V. & Son. The soil is teeming with the mycelium of some fungus, which has attacked and destroyed the roots of the Asters. The manure applied has probably favoured the development of the fungus. Lime would check its progress, if not detrimental in other respects. G. M.

BACK WALL OF A VINEY: C. E. S. Early Tea and other Roses might do if the shade is not too dense in the spring. Camellias would succeed; and these being plants not much affected by insects, are the best for the purpose. *Lygodium scandens* and *Selaginellas* are also suitable.

CARNATIONS: J. F. We found various insects, mites, &c., in the soil, but we cannot tell definitely which, if any, are the culprits. The leaves have the appearance of being attacked by eel-worm, but it will take some time to examine them. Your compost has apparently not been carefully prepared.

CELOSIAS, BEGONIAS, GLOXINIAS: C. B. There is no cure for the malady when it has developed to the extent seen on the plant sent. It would be prudent to take up and burn every affected plant. Another year try the effect of early dressings with the Bordeaux Mixture; not waiting, however, till the disease has appeared on the plants.

CUCUMBERS: E. F. B. Apply manure as a top-dressing, or liquid. Keep bottom-heat up to 80°, top-heat being allowed to run up to 95° for a few hours in the afternoon after closing the house; do not crop very heavily, or thin bine severely at one operation.

ESCALLONIA MACRANTHA: M. P. The proper time to cut in the hedge is early in August, or as soon as the plant has ceased to blossom. It would then allow time for the production of young shoots that would mature before the winter in your part of the country—Devonshire—sufficiently to escape being nipped with frost. We should prefer the scissor or the knife to the shears, although if the work be extensive, the latter must needs be employed.

FIGS: F. J. C. L. and H. South. The dropping of the fruit is not caused by fungi or bacteria. See that the soil is not too hard and compact at the root. G. M.

HAZEL-NUT: A. D. Imperfect fertilisation, from some cause. Another year try the effect of placing boughs of the common Hazel with plenty of catkins on them in the Nut bushes at flowering time.

MUSHROOMS: A. S., Norwich. When Mushrooms are affected in the manner that yours were, they are unpleasant eating, but perhaps not injurious; we would not recommend anyone to partake of them—it would be too hazardous.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—C. W. S. *Epidendrum nemorale*.—C. P. 1, *Cattleya Loddigesii*; 2, *Oncidium flexuosum*; 3, *Trichopilia fragrans*; 4, not recognised; send in flower, or give particulars of the plant and its flowers if you have seen them. 5, *Mesembryanthemum*, send flowers; 6, *Stenotaphrum glabrum variegatum*, more commonly known as *S. americanum*.—A. H. *Odontoglossum Lindleyanum*.—M. F. K. *Stanhopea inodora*. Colour and odour are of relatively minor importance in estimating botanical differences.—T. L. B. Yours is a very pretty natural hybrid (*Odontoglossum* of the section known as *O. Coraline*). The varieties of it usually lean more towards *O. Lindleyanum*, the least showy agent in the cross, yours towards *O. crispum*.—*Ireland*, 1, *Lythrum Salicaria*; 2, *Lysimachia fragrans*; 3,

Aster, not recognised; 4, *Epilobium angustifolium* album; 5, *Lysimachia thysiflora*; 6, *Bocconia cordata*.—P. Castle. *Taxodium distichum*.—E. O. J. *Veratrum nigrum*.—A. H. *Aërides odoratum* and *Oncidium carthagenense*.—J. G. The large leaf and flower are of *Impatiens Roylei*; the other we cannot recognise from the scrap sent. Send a fair specimen, and give particulars about the plant.—W. B. 1, *Campanula Portenschlagiana*; 2, *C. isophylla*.—J. P. Oh, that everyone sent as good specimens, and so carefully packed, as you do! 1, *Mackaya bella*; 2, *Lycocystis formosa*; 3, *Athrotaxis laxifolia*.—*Cardboard Box (No Name)*. 1, *Stachys palustris*; 2, *Galium aparine*; 3, *Galium cruciata*; 4, *Galium palustre*; 5, *Galium uliginosum*; 6, *Lotus corniculatus*.—G. A. A mere scrap, apparently *Muhlenbeckia complexa*.—*Lymington*. *Heuchera Richardsoni*.—W. T., *Leicester*. *Stachys palustris*; *Senebiera coronopus*.

PALMS: *Amateur*. It is not possible to dry home-grown leaves in the sun in this country so that they will equal the imported leaves. The leaves should be cut off before the feathers open entirely, or whilst they are slightly stuck together, and will therefore open after drying by giving the leaf a slight shake. Cycads should be fully expanded before drying. If the leaves are to be bleached, they must be exposed to the fumes of sulphur in a close chest whilst quite fresh and green. The leaves must be separated by being laid on laths or string. The other subjects named must first be dried in the shade, and then bleached in the sulphuring-chest, and afterwards dyed of any desired colour. This is, however, a business that few gardeners or others in this country understand perfectly, and we have no confidence in the results of amateur work in this department.

PENTSTEMON SEEDLING: T. T. A very poor strain, and hardly worth cultivating.

SEEDLING OF LATHYRUS LATIFOLIUS: *Lathyrus*. As a variety it is worth preserving.

STEPHANOTIS FLORIBUNDA FRUITING: C. J. L. Not unusual.

TABLE DECORATIVE PLANTS: *Amateur*. Next week we will endeavour to comply with your wish.

TEA ROSES WITH VERY STRONG SHOOTS: M. P. Under ordinary circumstances these strong shoots should produce blossom in the autumn, September, and October; and if they are monopolising most of the energies of the plant, do not stop them, but get them down gradually to a line approaching the horizontal, and let the other rather weaker shoots ascend. Remove entirely all weak and flowerless shoots, leaving no snags. Afford manure-water occasionally.

THISTLE: A. Y. Thank you. A good specimen of fasciation very common in quickly growing plants.

TOMATO: E. H. B. *Peronospora infestans*. Why send such a miserable scrap?

TOMATOS: J. B. *Cladosporium lycopersici* (see *Gardeners' Chronicle*, June 24, 1893). Burn the affected parts.

VALLOTA PURPUREA: W. and S. Colour variations are not very uncommon in this plant. There is a pure white form.

VINES AND GRAPES DISEASED.—J. Shaw. The fungi present on the Vines are not the cause of the disease, at the same time their presence indicates that something is deranged. Examine the roots, and if any tubercles or gouty swellings are present, please send specimens for examination. G. M.

WASP FOR RED SPIDER, &c., ON VINES: W. M. Such a valuable recipe should be made generally known.

WOODLICE: *Subscriber*. Catch them in pots half filled with hay, in the same manner that earwigs are trapped, put plates or tiles on the staging and ground in the houses, elevating these about half an inch from the ground, &c., and clear out the insects that are sure to be found there every day. It is a good practice to pour boiling water into their haunts.

SATURDAY, AUGUST 7, 1897.

THE DISEASES OF PLANTS.

(Continued from p. 81.)

PREVENTION OF FUNGUS DISEASES.

THE great aim of all prevention is to cultivate so that fungus-parasites are unable to maintain a foothold. It is achieved either by avoiding conditions which are favourable to the growth of the pest, or by preventing the crop from becoming predisposed to fungus-attack. Thus, while the practice of growing the same crop over a large area is economical and convenient, it can scarcely be considered healthy, because in the competition amongst the plants for light and air, the strong rise above the weak, which die out, and in dying fall an easy prey to any fungi about. The conditions amongst growing crops are also otherwise favourable for fungus-growth, for there we have generally the abundant moisture and the still air so welcome to all fungi. Then, if any pest does obtain a foothold in our large fields, how rapidly it spreads. The "damping-off" fungus is a familiar pest in seed-pans or beds of seedlings; it is a dangerous fungus only so long as the plants are young and insufficiently protected, and rarely attacks old plants whose outer tissues have become thickened and hardened where the stem enters the soil. If the pans are crowded and growth is forced, this hardening process is delayed, and the seedlings are left longer exposed to damage from the fungus. The treatment for damping-off is air for the seed-pans, room for each seedling to grow, and water in moderate quantity; in other words, to make conditions which will enable the seedlings to grow less in size though more in strength, and which will not encourage the growth of fungi. The same argument applies to flower cultivation, vegetable raising, and young forests; it may be expedient for economy and other reasons to crowd plants together, but in so doing greater risk of disease is incurred.

In many a farm, garden, or wood, there are places where the cultivator finds that certain crops will not grow without becoming diseased. It may be some badly-drained hollow in a field where Potato disease flourishes, or from which "finger-and-toe" is never absent; or it may be a particular place where mildews prevail on Roses or vegetables, or it may be some part of a wood where Larch canker abounds. In any case, it is clearly seeking defeat to attempt to grow in such a place plants likely to go bad there; the plants are predisposed to disease by the conditions of the locality.

Cleanliness in its widest sense is an important virtue in a cultivator who wishes to keep his crops healthy. No unhealthy plants or decaying debris should be left about. How often does one find, say in a market-garden, a heap of leaves and roots, removed in dressing plants for use, swept together with weeds and other things to decay and rot. Such a heap is a

splendid nursery for diseases of fungous origin; here the fungologist is sure to find a happy hunting-ground where he will be rewarded with many specimens. Disease nourished in a place like this soon spreads into growing crops. Again, under glass, there are many conditions favourable to the growth of fungi, particularly if forcing is going on; under the stages, behind pipes, on old neglected woodwork, these are the breeding grounds for multitudes of fungi. For garden or house the treatment is the same, to destroy all rubbish by burying deep in the soil, by making into compost with good strong quicklime, by burning, and by washing down all parts of houses or frames with quicklime in water, with sulphate of copper solutions, with very weak carbolic acid, or weak Condy's fluid.

What are exactly the conditions which dispose cultivated plants to disease is not a problem which can be fully discussed in the present paper. It may, however, be stated as a good general rule that few fungi or bacteria are so virulent and fatal as to take hold of and destroy really healthy plants. Either the plants must be weakened, or the fungus strengthened by some course of treatment. There is no doubt that many fungi which are at first nearly harmless, may become deadly enemies of living plants if grown in suitable conditions. As an example of such a case, we may cite the "Botrytis," Lily disease, described some time ago by Prof. Marshall Ward (see *Diseases of Plants*, chap. viii.), and since referred to several times in the *Gardeners' Chronicle*. In a similar way many fungi may be bred to become parasites on plants. The nurseries for fungi of this kind are, no doubt, these very rubbish-heaps, &c., already referred to; hence the urgent necessity for their early and thorough treatment to exterminate all fungous life.

On the other hand, cultivated plants may be so treated as to render them more liable to attack from fungous enemies. Thus, early forcing, like the growing of a crop over a large area, may be profitable from a market point of view, but it is extremely risky for the health of the plants. Forcing in most cases consists in placing the plants under more or less artificial conditions of soil, atmosphere, and light, in order to make them produce foliage, flower, or fruit of a finer quality, or at a different season from the plants grown more naturally. A frequent result of this treatment is to promote tender foliage, succulent growth, and a condition of the plant generally suited to predispose it to fungous or other disease. Tender foliage means, e.g. in Carnations, that the epidermis of the leaves is thin and moist, so that fungus-spores landing there are placed in circumstances which promote their germination and easy penetration into the foliage; add to this the fact already mentioned, that forcing conditions are otherwise favourable to fungus-growth, and we have a general explanation of how forcing predisposes a plant to disease. What has been said of forcing applies more or less to the cultivation of many plants; the treatment necessary to bring about a certain result—fruit, flower, or foliage—renders the plant more susceptible to attacks by fungi, and fits them better to furnish a nursery-ground for disease. We do not, however, condemn or disparage the necessity of forcing, or any particular mode of cultivation—if it pays otherwise, well and good; we only emphasise that there are certain risks and penalties attached to such practices.

It will thus be seen that the prevention of disease lies well within the province of a gar-

dener's every-day work. By care in this way many diseases may be avoided, and the grower may never be called on to actually face an outbreak. We personally lay great weight on the value of prevention of disease, but it is impossible here to go into the various precautions in any detail; fortunately, many of them are part of that general experience gradually acquired by every grower of plants. *William G. Smith, Edinburgh.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

CATTLEYA WARSCEWICZII GIGANTEA.

THE record of this remarkable variety will be doubly interesting, as it will, I believe, give measurements of that which I consider to be the largest flower of any *Cattleya* that has as yet appeared. But it does not rely on its size alone for distinction, for it is remarkable in form and richness of colouring. The flowers are of fine substance, and flatly displayed. The sepals are broad, and nearly as long as the petals, which are each over 5½ inches long, and 3½ inches wide. The flower, which supports its heavy petals horizontally, therefore measures 11 inches in width. The sepals and petals are light purplish-rose; the very broad labellum crimson-purple, with the usual yellow blotches, one each side of the middle portion. It is the largest of a lot remarkable for their size and beauty in the collection of Joseph Broome, Esq., Sunny Hill, Llandudno. *James O'Brien.*

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM ×.

Messrs. B. S. WILLIAMS & SON send us an extraordinary bloom of *Cypripedium* with two lips; but that is not the whole change, though it is the one that is most conspicuous. The dorsal sepal or standard is normal, the two lower ones are smaller, separate, and spreading. Inside these comes a whorl of two lateral petals and two perfectly-shaped lips. The column is somewhat twisted, and has a broad saddle-shaped staminode bearing on each side an anther. The stigmatic mass is almost completely divided into three separate lobes, of which one is opposite the dorsal sepal.

"THE ORCHID HYBRIDS"

Mr. George Hansen gives evidence of his enthusiasm and diligence by the preparation and publication of a second supplement to his list of *Orchid Hybrids*. Distance from horticultural centres especially from the Orchid collections of Europe, does not deter him, and in spite of some misprints, he has produced a list which will be so useful as to counterbalance its defects, and ensure its finding a place on the shelves of all orchidists desirous of keeping up to date. It may be had from Mr. Geo. Hansen, Soenic Tract, Berkeley, California.

SCHIZANTHUS RETUSUS AND S. PINNATUS.

THESE two species are among the most beautiful and practically useful of all annuals for indoor culture. Both have lately been very fine in the Cambridge Botanic Garden. The first grows to a height of about 3 feet, and produces large panicles of elegant flowers an inch and a half across, chiefly of a beautiful carmine colour; but ornamented on the upper lobe by a great golden blotch which contrasts very finely with its companion colour. This species is not so often grown as *S. pinnatus*, but it well deserves a note for sowing at the same time, which may be about the middle of August for spring flowering, and later for early summer. Of *S. pinnatus*, a great show of the forms known as papilionaceous is recently over, but a pure white still remains in flower. It is in possible

to describe the variations of colour, but they embrace various shades of lavender and purple, and are beautifully spotted with darker tints, and sometimes with blotches of yellow.

Both species must be adepts in the attraction of insects for securing the advantages of cross-fertilisation; and this one in particular, unlike the other, possesses an admirable mechanism for dusting its visitors with pollen; and early in the day, as a rule, every flower arrived at maturity has dispersed a cloud, sprung by the weight of a tiny insect. It is very simply managed. The lower lobe forms an alighting platform, and folds on each side hold down the filaments in a state of tension until the weight of an insect sets them free. The anther-cells are already open, and, like little boxes, contain a quantity of loose pollen, which is spread in a cloud by the recoil of the filaments. Until this happens, the stamens lie in a central hollow of the lobe, which forms the alighting platform. As an example of a mechanism, interesting to everybody, nothing could be better than this. Some readers may remember the magnificent specimens of this species grown by the late Bruce Findlay, at Manchester, and to them it needs no recommendation as a most ornamental plant for the greenhouse. Culture is exceedingly easy, and the chief point is to bear in mind the great principle in growing annuals of the class—that of having good stocky plants to keep through the dead of winter, when growth cannot be satisfactory, and must be discouraged. The seeds may be raised under glass, but the plants should be grown entirely in the open for so long as the weather permits. They may be sown in 32-sized pots, to be thinned out to five, or seedlings may be pricked out from a seed-pan. Early in October, or before, according to the weather, the pots may be transferred to a shelf near the glass in the greenhouse. The lowest greenhouse temperature is best, in order to keep the plants quiet, and as at all times they are liable to the attacks of mildew (an Erysiphe), water must be carefully given. The plants shift well, and in spring may be transferred to 24-sized pots, in which, for ordinary purposes, they may be allowed to flower. From the nature of the case, the soil used must drain readily, but at the same time it ought to contain a fair proportion of good loam, which conduces to a sound and solid growth. *R. Irwin Lynch.*

KEW NOTES.

No doubt the flower-beds here on each side of the principal walk, and in front of the Palm-house, are most attractive to the general public at this particular season of the year, and to them the gardens owe much of their beauty. It is pleasant to see that the beds do not entirely depend upon bedding Pelargoniums for their beauty, effect, and interest. That beautiful hardy herbaceous perennial *Bocconia cordata* is represented by a good bed; it is an excellent subject for isolated positions on lawns or woodlands, its handsome cordate leaves and feathery spikes of flowers being very effective. A mixture of the always effective *Acer Negundo variegatum*, and *Ferdinanda eminens*, a fine ornamental-foliaged stove perennial, makes a light and graceful arrangement. Good use is made of *Salvia patens*, the plants producing a striking effect as seen in a mass. An attractive bed is made up of the purple-flowered *Chnicus diacanthus*, *Iresine Wallisii*, and the bright Pelargonium *Vesuvius*, the whole edged with a *Viola* aptly named *Snowflake*. A bed of *Verbena Ellen Willmott*, a light rose-coloured flower, is blooming very freely, and as seen in a mass, produces a telling effect.

Alyssum maritimum variegatum forms a good edging to *Heliotrope Miss Nightingale*, light, one of the best; and *Calceolaria amplexicaulis*, *Gaura Lindheimeri*, with its free and gracefully arching spikes of white and red flowers, make a happy combination, associated with Pelargonium *Henri Jacoby*, *Lobelia fulgens*, and *Calceolaria amplexicaulis*, edged with *Tropeolum Vesuvius*, make a good bed. *Canna Paul Bert*, with dark foliage, shaded chocolate

and purple, and circular-formed flowers of a glowing amber shade, is very distinct and dwarf, and is in a groundwork of the old *Fuchsia globosa*, one of the best of the hardy kinds. The old *Verbena venosa* and Pelargonium *Daybreak*, edged with *Viola Arobie Grant*, make a pretty mixture. Roses planted out in beds have, of late years, been well cared for at Kew, and this season is no exception to the rule, although the continued hot weather has militated against their general success; still, they have been much admired, compelling the admiration of the King of Siam and his suite on a recent visit, for, as one of their number observed, they saw nothing like it in Siam, although Roses grow there. How charming is a bed of the Polyantha and a single group (*Rosa polyantha hybrida*). Especially noteworthy is *Little Dot*, white, with pale salmon-pink centre; *George Pernet*, pale rose, very dwarf and compact; *Red Pet*, dark crimson; *Perle d'Or*, nankeen-yellow, with orange centre, yellow; *George Pernet*, rose, changing to peach, with yellow shading, most free and continuous bloomer, a charming flower; *Gloire des Polyantha*, an almost perfectly formed flower is very charming. *J. B.*

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 63 to 69.)

0, SCOTLAND, N.

CAITHNESS.—The early-flowering Apples, Cherries, and Strawberries, suffered very much from the cold north winds which prevailed in this part when the trees and plants were in bloom, with the result that these fruits were almost a complete failure. The later-flowering kinds and varieties promise good crops. *W. F. McKennie, Thurso Castle Gardens, Thurso, N.B.*

— I find that the cold and wet sunless season we experienced in this part of the country last year has been against the trees bearing even an average crop, and small fruits are especially poor. The Apple crop on trees on south and west walls I have not seen so good for the last twenty years, but crops of all kinds are a fortnight later than last year. *W. Mackie, Dunbeath Castle Gardens.*

MORAYSHIRE.—With the badly-ripened wood of last autumn, and an exceptionally cold spring, our fruit-crop this year is a very thin one. Apples and small fruits are the only ones which have an average crop, and of these Lord Suffield, and all the Codlins are heavily cropped. Pears and Plums, although they seemed to set and swell their fruit for a time, have dropped to such a large extent, that scarcely a fruit is left on some of the trees, Denyer's Victoria Plum being an exception, there being a nice crop on most of those trees both on walls and standards. Apricots, Peaches, and Cherries are the worst crop that I have seen for years. The week of hard frost in April seemed to paralyse all growth, and what fruits were not killed at that time have dropped since. The Peaches have also been blistered to such an extent that some trees are completely spoiled. *Ohas. Webster, Gordon Castle Gardens, Fochabers.*

NAIRNSHIRE.—Our fruit crops of all kinds looked very well in the beginning of the season, but they suffered very much through the severe frost in the middle of June, when on two successive mornings the thermometer registered 6° and 7° respectively; but Kilravock suffered rather more than neighbouring gardens—still, on the whole, I think my report is pretty near the general condition of the district. Crops of all kinds are about six weeks later this season. *Alexander Ross, Kilravock Castle Gardens.*

SUTHERLANDSHIRE.—The worst crop for many years. *D. Melville, Dunrobin Castle Gardens.*

1, SCOTLAND, E

ABERDEENSHIRE.—The Apple crop is very irregular, some trees having a large crop, whilst others have a few; blossom was abundant. Pears blossomed freely, but the blooms set badly, and the crop is a thin one. Plums, such free-setting varieties as *Victoria*, have good crops, and other varieties are fair.

Cherries, although bloom was plentiful, are a very poor crop. Strawberries, Gooseberries, Raspberries, and black and red Currants are above the average. Lack of sunshine, and the cold east winds prevailing when the fruit-trees were in blossom, account for irregular setting. *John Forrest, The Gardens, Haddo House, Aberdeen.*

BANFFSHIRE.—Peaches, Nectarines, and Apricots are a total failure, although early appearances were in favour of a good crop, but our hopes were blighted by the cold winds. Fig-trees on the open walls are as usual promising well; Pears are about half a crop; Apples on standard trees and on espaliers are under the average, although they had a great show of blossom. Small fruits, as a rule, are all good, especially Gooseberries and Strawberries, but three weeks later than usual. *J. Fraser Smith, Cullen Gardens.*

BERWICKSHIRE.—The Apple crop, notwithstanding the abundant bloom, is the poorest that we have had for several years, the long spell of cold, sunless weather we had at blooming-time and afterwards doing the mischief. Some varieties, viz., *Kewick Codlin*, *Lord Grosvenor*, *Winter Hawthornden*, *Stirling Castle*, have a fair crop. Pears have set well, and there is promise of a good crop. *Doyenné du Comice* is our finest Pear for walls here. Plums, *Denyer's Victoria* for example, are a very poor crop. Small fruits generally are good, but Strawberries are not "sweetening" well. It is, on the whole, the weakest season, so far, that we have had for many years. *John Cairns, The Hirsell Gardens, Coldstream, N.B.*

— In the month of February, 1897, fruit-trees and bushes in this district never gave better promise of an abundant crop of fruit, but such havoc was wrought by bullfinches from that date onwards to the respective flowering seasons, that the crop is only an average one; and here the Apple crop is almost a failure—the few buds left by the birds were still further reduced when in flower by 6° of frost on June 7 and 9. Strawberries were also completely ruined by this late frost. *Victoria Plums* are a very heavy crop; all other sorts were so damaged, that in general the crop is only an average one. Gooseberries are in a similar condition. In some parts of the garden they are very heavy crops, in other parts nothing. *James Ironside, Blackadder Gardens, Edrom.*

EAST LoTHIAN.—What was feared would prove an exceptionally bad fruit year is turning out, with the exception of Apricots, and perhaps Peaches, a good average one; it is, however, characterised by remarkable lateness, and therefore it is impossible to indicate with any degree of certainty the general quality of the various fruit. Growth is remarkably healthy, and foliage well developed. *R. P. Brotherton, Tynninghame, Prestonkirk.*

FIFESHIRE.—There is no kind of fruit in our district that is over an average crop this year. With the exception of Codlin varieties of the Apple, the crop is very light, and some of the finer varieties, such as *Cox's Orange* and *Blenheim Pippin*, are almost fruitless. The trees are healthy, however, and comparatively free from caterpillar; while the Plum is badly attacked with green-fly, the result in some degree being due to the absence of wasps. Peaches suffered much from blister and frost, as well as the Apricot when in flower. Early Cherries are good, while late and Morellos are a poor crop. The scarcity of fruit may be attributed to the wet, sunless autumn, combined with the heavy crop of last year—giving another object-lesson in favour of thinning to secure a yearly moderate crop of good fruit. *W. Williamson, Turril.*

FORFAR.—The fruit crops in this quarter are very much later than usual, the first-gathered Strawberries being three weeks later than last season; and owing to the cold and wet weather, mildew on the berries is prevalent. Pears are a fine crop, but stand very much in need of fine warm weather to swell the fruits to the usual size. The same may be said of the Apple and Plum crops. *W. Alison, Scavien, Monifieth.*

KINGDOMSHIRE.—Of Apples, there are none here, and the crops of this fruit are under in this neighbourhood. This is a very different state of things to last year, when in the gardens here the crop of Apples was enormous. Apples and Pears on walls have an average crop. *J. M. Gairns, Arbutnot, Fordoun.*

— Apples and Plums are the worst crops hereabouts, as after bearing a big crop last year the trees bore but few flowers, which seemed to set; but the cold nights and east winds caused many of those to drop. Apples are the better of the two, but still being under an average crop. *Wm. Knight, The Faque Gardens.*

MIDLOTHIAN.—The autumn of 1896 being cold, wet, and raw, fruit trees did not ripen: their young wood under favourable conditions; and although there was a great abundance of flower-bud formed

Duchess of Oldenburg, Worcester Pearmain, Tower of Glamis, Stirling Castle, Golden Noble, Blenheim, King of the Pippins, Prince Albert, Frogmore Prolific, Golden Spire, Grenadier, and the like free bearers. Plums and Cherries are also fine, but the crop of the latter is generally thin. Peaches and Nectarines are a better crop on the open walls than they have been for years. Apricots were thinned by severe frost when in flower; but there is a light crop of very fine fruit. Currants and Gooseberries were injured by frost, but in sheltered places the crop is good. Strawberries are a great crop but extra late, John Ruakin being five weeks later than last year, and our earliest both seasons. Royal Sovereign did not do well in the cold, damp weather, but is now pulling itself up with the heat. Superlative still holds the lead among Raspberries, and looks like maintaining it for many years to come. *Malcolm Dunn, The Gardens, Dalkeith, Midlothian.*

weather experienced since the trees were in flower; some varieties of Apples failed to set, while others have good crops. Cherries dropped wholesale at the stoning period, and the Gage Plums are not good crops; while all the small fruits are plentiful and good. *Wm. Wright, Taymouth Castle Gardens.*

SILKESSHIRE.—The crops of Apples and Pears here are very poor, just a fruit here and there; Plums are a failure, excepting Victoria. Cherries, Apricots, and Peaches are a thin crop; Strawberries are a heavy crop, but owing to a cold sunless June the half of the fruit did not swell; the same holds good of Raspberries. *O. Turner, Sunderland Hall Gardens, Selkirk.*

6. SCOTLAND, W.

AYRSHIRE.—The promise of the great crop in early spring was much spoiled by the severe frost that occurred in the month of April, and fruits of Peaches and Apricots have almost disappeared. Apples will, I believe, be a good crop if we get genial weather in the autumn. The fruit-trees are clean, and growing finely, owing to much rain having fallen. Small fruits got a severe check with frost when in flower, Black Currants being much smitten. *A. Wilson, Auchincruive, Ayr.*

DUMFRIESSHIRE.—I never saw fruit trees with finer promise of a crop of fruit in the spring, but the long spell of cold, wet weather, and the abundance of caterpillars, completely spoiled them; the only Plum we have with a fair crop upon it is Denyer's Victoria. Early Cherries are a very poor crop, but Morellos set better. Of small fruit, black Currants are the only kind which has a fair crop. *George McKay, Balloch Castle Gardens.*

DUMFRIESSHIRE.—Neither for quantity nor quality will the fruit crops in this district break the record of previous years. With the exception of Strawberries and Raspberries, the yield is much under the average, while the quality and finish of the fruits now ripening is deficient. The fine summer weather will no doubt improve matters very much; but still, as a whole, the fruit crops in this district are disappointing this year. In nearly all cases there was a splendid show of blossom, but the extreme fluctuations of temperature, excessive amount of rain, and the very late frosts, with occasional strong gales of wind, caused great damage when fruit trees were in flower. With us, Strawberries and Raspberries are the only crops that are over the average, and of which the quality is good. Cherries, Pears, Peaches, and Apricots are a very thin crop indeed, and it is only on some of the well-known, free-fruited varieties of Apples and Plums that anything like a remunerative crop can be looked for. There is, however, a great demand for home-grown fruit of all kinds in the south-west of Scotland, and market-growers are getting excellent prices for fruit of good quality. *J. Mackinnon, Terregles Gardens.*

— Apples, Pears, and Plums, are very much under the average crop here. The heavy rains in June saved the crop of Strawberries. Late spring frosts are very prevalent here, which often prove disastrous to all kinds of outdoor fruits. *David Inglis, Drumlanrig, N.B.*

STIRLINGSHIRE.—The weather in the spring months was unusually cold and wet, with a low night temperature which often went below the freezing-point. Fruit-trees of all kinds had abundant and strong blossom, which, for the reason stated, failed to set well. *A. Crosbie, Buchanan Castle Gardens.*

— The continuous cold rain had a bad effect upon the bloom of Cherries, Plums, and Apricots, and the prevailing temperature very changeable. The temperature at night has been exceptionally low all the season, the thermometer often during the earlier part of July standing at 35° to 40° in the early morning hours. I cannot overrate the importance of making selections of fruit, when planting is done, suitable to soil and climate. *M. Temple, Carron, Falkirk.*

WIGTONSHIRE.—Hard frosts in May, and heavy storms in June, have seriously damaged the fruit

FIG. 23.—*EPILAZIA* × *RADICO-PURPUREATA* (*EPIDENDRUM RADICANS* ♂, *LÆLIA PURPUREATA* ♀).

Sepals and petals light orange-scarlet; lip yellow in the centre, banded with light purple.

(Raised by Messrs. J. Veitch & Sons, of Chelsea. See *Gardeners' Chronicle*, July 31, 1897, p. 61.)

on nearly all kinds of fruit, they proved to be weakly in the spring, and after making a great show when in blossom, the most of them dropped off, except in the most favoured places. Here, on a free warm soil and well sheltered, fruit on the whole has done well, although the spring was cold and late, and up to the first week in July, the season was quite three weeks behind the average. The fine warm weather of the last fortnight has done an immense deal of good to all garden crops, and the fruit is swelling to a fine size under the genial sunshine. Trees are very healthy, and the cool season, till recently, has kept insect pests in subjection. Pears are the crop of the season among fruit; nearly every popular variety bearing a fine crop of handsome fruit. Apples are not so heavy a crop as the Pears, but they are equally large and fine. All the Codlin tribe are bearing profusely, and so are such popular Apples as Ecklinville, Warner's King,

— Apples bloomed late, and seem mostly carrying a full crop. Pears, Plums, and Cherries bloomed freely, but the bulk of the crops dropped in the setting. Few Gages or other Plums are grown around Edinburgh; Peaches and Nectarines not largely grown, but in warm, sheltered gardens fair crops of them are found. Apricots are scarce; Gooseberries generally thin; red and white Currants and Raspberries a fair crop; Strawberries a month later than last year, good crops, but small as compared with southern supplies. *D. T. Fish, 12, Fettes Row, Edinburgh.*

PERTSHIRE.—With the exception of Peaches and Apricots, the fruit crops in this district are, on the whole, good, but everything is about a month later than usual. *A. McKinnon, Scone Palace Gardens.*

— The fruit prospect this season has never been very promising, owing to the ungenial

crops in this locality. *John Bryden, Dunragit Gardens.*

--- The crops in this part, with the exception of bush-fruits, Strawberries, and Figs, are all very much below the average, Pears and Plums being the worst. Apples are fairly good on early varieties, as the Codlins, Ecklinville Seedling, Warner's King, and some of the Pippins; but many trees of later varieties are fruitless. Figs growing against walls are heavily cropped, and promise to finish up fine fruit. *James Day, Galloway House, Garliestown.*

2. ENGLAND, N.E.

DURHAM.—The fruit crops here, I regret to say, are very poor. The enormous crops of fruit of all kinds that we had last year have had something to do in lessening the crops this year, and the long-continued sunless weather and cold frosts in the early months prevented the blossoms from maturing. Currants, Gooseberries, and Strawberries are the only fruit that can be called a fair good average. *J. Noble, Woodburn Gardens, Darlington.*

--- Small fruits are scarce owing to the cold weather that prevailed during the time when the bushes were in blossom, then afterwards we had very unsettled weather with fogs from the sea, which caused the fruit to fall; but the fruit trees we do not prune have a fine crop, the foliage having protected the fruits against the cold. This is the worst year for fruit that I have experienced here for forty-two years, and now we have a spell of dry, hot weather which is fatal for ripening the Strawberries and other fruit to perfection. *R. Draper, Seaham Hall.*

NORTHUMBERLAND.—Very few Peaches, Nectarines, and Apricots are grown out-of-doors in this cold upland district, and on the few trees met with there was abundance of bloom, but the long-continued, cold, ungenial spring destroyed it. Apples had abundant bloom, but it was weak, hence easily starved with low temperature. It is almost too soon to speak of the quality of the out-of-doors fruit here, we are so late. *Joseph Oliver, Felington Park Gardens, Whittingham.*

--- From the middle of August last year onward, we had much rain, and but little sun to ripen the wood of the fruit trees; and from March to the end of June this year we had exceptional high, cold winds. The blossoms on Peach and Apricot-trees, and on the Plums growing on North walls, have been very weak; still, some of the trees are over-cropped, but the greater number have but few fruits. Strawberries were injured by late frosts and cold winds, and the fruits are not swelling off well. Apple-trees are splendidly cropped. *George Harris, Castle Gardens, Alnwick.*

YORKSHIRE.—Standards and bushes of Pears have an average crop, but the trees on walls a fairly good crop. Among Apples, Lane's Prince Albert, Domino, Keswick Codlin, and Lord Suffield, are the only varieties having an average crop. Plums are a complete failure. Peaches and Nectarines out-of-doors are carrying very few fruit. Gooseberries and Currants are thin on the bushes, and the fruit small. Raspberries a good crop. Strawberries few and small. Nuts are a failure. *J. Riddell, Castle Howard Gardens.*

--- The Apple trees had plenty of blossom, but this did not set well, a great many falling off, owing, I think, to the drought. Pears showed but few blossoms, and these set badly. The Plums showed very few blossoms. The fruits of the sweet Cherries were cracked badly; and those of the Morellos mostly turned of a yellow colour and fell off—the trees themselves are healthy. Peaches and Nectarines are good outside, as are Apricots, but are dropping off the trees. The Strawberry crop was a heavy one, and the fruit large, the finest being President. The Gooseberry crop suffered from the depredation of birds taking the buds in winter. *John McClelland, Ribston Hall Gardens, Wetherby.*

--- The present season is the worst we have had for a long time, the result in part of the heavy crops of last season, a wet autumn, which pre-

vented the thorough ripening of the wood, and the cold sunless weather during April last and May. The fruits on young plantations of Royal Sovereign Strawberry are excellent as regards size, weight of crop, and quality; Black Prince, Noble, and President also very good. *Bailey Wadda, Birdsall, York.*

--- Fruit crops suffered from the sharp frosts in the spring, especially Currants and Apricots. There was an abundant show of blossom, but only Apples and Strawberries hereabouts are an average crop. *Geo. Batley, Wentworth Castle Gardens.*

--- All hardy fruits blossomed well, but the continued cold east winds and keen frosts during May and June not only killed the blossom, but caused the majority of the fruits to fall off after being set. It seemed remarkable, but the early leafage put forth by Currants and Gooseberries saved the crop, which in our case proved to be very good. Strawberries suffered later from the drought as well as from the effects of cold weather. *J. P. Leadbetter, Tranby Croft Gardens.*

--- In this district, in the spring, there was a great wealth of bloom on all fruit trees, and a rosy prospect of good crops of fruit; but the continual cold from the north-east paralysed the energies of the trees. The protracted spells of cold, I find, are far more injurious to a full crop of fruit than those cold snaps we are familiar with during the latter half of May. Nevertheless, we have a heavy crop of Codlin Apples, and some few other varieties, notably that grand Apple, Lane's Prince Albert, Cellini, Ribston, Cox's Pomona, Cox's Orange, and Warner's King. Of Pears, the Jargonelle is a good crop generally. Plums are a total failure. *John Easter, Nostell Priory Gardens.*

--- Apples as a whole are a moderate crop, Keswick Codlin, Mère de Mönage, Potts' Seedling, Stirling Castle, Sturmer Pippin, and Warner's King being the best cropped. Of Pears, Louise Bonne of Jersey, Marie Louise, and Souvenir du Congrès are the best. I have not seen a Plum tree upon which there is a good crop in this neighbourhood, and in this garden we have scarcely any. Of Strawberries we had a good prospect in the early spring, but the sharp frosts and cutting winds in May were most disastrous; then the storm of June 16 completed the wreck. It is, as a whole, the worst season I have ever experienced. *Thos. Bonsall, Elmet Hall Gardens, Leeds.*

--- This is the worst fruit season we have had in this district for the last six years. Of Apples, Irish Peach, Lord Suffield, Prince Albert, and Glamys Castle have an average crop; a few other varieties have a sprinkling, while many varieties have not a fruit upon them. Pears, too, are very thin, a few trees in the most sheltered places having about half a crop, and this after one of the most splendid promises I ever saw; but the blossoms were battered to pieces by the terrible winds that blew the whole time the trees were in bloom. In Plums, Victoria is the only one with an average crop. Sweet Cherries are a failure, and Morellos half a crop; Apricots are very light, Strawberries plentiful, but the fruit is small. *J. Hughes, Wentworth Woodhouse Gardens.*

(To be continued.)

THE ROSARY.

ROSE PEST.

We have lately had brought under our notice, in a way more striking than agreeable, the ravages of a mould which Mr. Massee has kindly identified for us as *Actinonema Rosa*. It occurs in the form of long, brown blotches on the upper surface of the leaves, the blotches being irregularly oblong along the midrib, but elsewhere nearly circular. Furthermore it attacks the young shoots, and causes them to blacken and die back to the old wood. After a few days the leaves fall off, and the bush is stripped, leaving only the skeleton and the blasted twigs. The disease is rapidly contagious, one bush having been first affected, from which the fungus has spread to other bush and

standard Roses in the same bed. We have followed Mr. Massee's advice to collect and burn the diseased leaves, but fear that this will only prove a partial remedy. In addition in the hope of preventing the spread of the disease, we have freely applied Barr's Bordeaux powder to the neighbouring Roses.

ROSES, H.P.'s AND TEAS.

For appearance sake, and for the production of some late flowers, Rose-bushes, &c. should be examined, and have all the faded blooms and weak shoots removed; and in the case of vigorous plants some slight amount of pruning should be done. On hot dry soils, and where the rainfall has been slight, the bushes, standards, and wall-plants will be greatly benefited by an occasional soaking of manure-water, or failing that, of clean water. In most deep loams Roses will bear a good deal of drought without injury or check; but it is quite otherwise on light shallow soils, and much care is required in order to keep the plants in vigour. I should like to make mention of a few good Tea Roses whose buds are usually plentiful and strong, viz., *Perle des Jardins*, *Adelina*, *Vivian Morel*, *Gustave Regia*, *Claire Jacquier*, *l'Idéale*, *Caroline Testout*, *W. A. Richardson*, *Edith Gifford*, and *Celine Forestier*. *H. Markham, Margate.*

METHODS OF PROPAGATION.

(Continued from vol. xxi., p. 316.)

VINES FROM EYES.—In addition to the classified methods of raising plants in nurseries, already treated upon in these articles, there are other processes that cannot well be scheduled. Single-eye, or bud-propagation, is the recognised method for the Vine and other kindred subjects, and it is wonderful what results may be obtained in this way. Not many years ago, Vines for all purposes were increased by layering; but now, probably, Vine-stocks are as few and far between in nurseries as the Great Auk is among birds. This being effected in the open air, the canes when rooted were only partially ripe, and consequently, fit only for "planters," but now few gardeners will accept such Vines for any purpose, but prefer those raised from single eyes or buds. I propose now to give the process as successfully practised by myself and others.

Those who have vineries under their charge, will have no difficulty in selecting some well-ripened wood, carrying good promising buds, when they prune back their Vines in late autumn or winter. The shoot must have a distinct label put to it, and be laid in by the heels in a cold vinery, or other place free from frost.

If there is plenty of heat at command, commence propagation in January; but if not, defer starting till the end of February. Prepare some fairly rich soil, and as many as required of clean 60-size pots. Put a single crock at the bottom of each, and fill loosely with the prepared soil. Taking a piece of the reserved Vine-wood in hand, hold it firmly above the bud, in the left hand, and then cut diagonally through the Vine, so as to make a pointed piece of wood, about 2 inches long, carrying a single bud, and finish off by cutting straight through the piece, just above the bud. The large broad buds had better not be selected, as they often conceal an embryo bunch of flowers, which, if allowed to develop, will hinder vigorous growth. Prepare as many eyes as you require, and taking one of the prepared pots of soil, dibble a small hole at the side, and introduce one of the finished Vine eyes into the hole in such a position that the bark is next the inside of the pot, and the cut face of the eye is pressed against the soil, add a little more soil, and press all very firmly. Be careful to label the varieties, thoroughly soak them with tepid water, and then plunge into an inside pit in either tan or cocoa-refuse where there is a regular but gentle bottom-heat. Keep quite close for a week, and when giving water or air, just look over the batch and see that none is dry or has developed fungus-growth at the cut part, this being easily avoided by covering the surface of the soil and eye with sterilised silver

sand. In about three weeks the eyes will be well-rooted, and may be given their first shift into large 48's, but this and all re-potting should be done in the warm propagating pit, and the soil used be also warmed, as at this period of growth the young Vines are most sensitive to changes of temperature, and a chill will not only retard progress, but may spoil them for some time. Upon steady but unchecked growth depends the ultimate success of this process. The young Vines will make quick progress, and the temperature of the Vinery may be allowed to rise to 90° or 100° in the daytime, and should not be less than 75° at night. As soon as the roots show freely upon turning the plant out of its pot, the Vines may be given their final shift, for though others prefer to shift twice after this, I think it unnecessary. Prepare some fresh loam and well-decayed manure, and add to it one-quarter part its bulk of bone-meal, mix well and then proceed to repot into 10 or 12-inch pots, leaving the surface of the soil about 3 inches below the rim of the pot to allow a mulching of cow-dung to be added on the surface, and when all are

reached, gradually decrease the heat, and give plenty of air, only syringing at night before closing the house. Soon this may be dispensed with, the only water used being applied to the soil. Be cautious not to break or bruise the terminal growth, as this is almost certain to induce lateral growth, and so spoil the rods.

When the wood in the lower joints begins to get nut-brown and firm, afford air night and day, but without draught, and as soon as the lower leaves begin to assume a rich colour, the Vines may be taken out into the open air, and fastened up against a south or south-west wall, to finish off, though some keep them in the house till the foliage begins to fall; and I have heard a grower say he did not mind a little red-spider at this period, forgetting that though at this stage it could do little or no harm, yet eggs will be laid in the minute crevices of the bark, which remaining dormant during the winter will, in the following summer hatch and produce myriads of this minute pest, and so do much harm. Of course, in wet sunless seasons Vines will not properly finish

advantage is that no definite period can be fixed for the cutting of the crop which will be found suitable for all species represented, and we must either cut individual trees as they mature, or strike an average which can only be suitable for two or three species at the most. By adopting the first method we run the risk of letting in strong winds which may make gaps during every winter, while the necessity for waiting until the longest lived trees are ready for the axe involves the non-utilization of a great deal of the ground for many years. By fixing upon a definite period for clearing the ground, a great many trees must either be immature or else overripe, conditions which always reduce the value of the timber. But however strong a case can be made out against mixing trees together for the sake of giving the plantation so-called "variety," nothing can be said against a mixture made with due regard to the habits and requirements of the species which compose it. By a judicious blend of shade bearers and light demanding species, much heavier crops can usually be obtained than when the latter are grown alone, for in such a case the ground is rarely shaded sufficiently well to keep weeds and rubbish from springing up beneath, a condition of things, however, which is not altogether objected to in game covers. But taking the economic *pros* and *cons* of the case first into consideration, pure woods are sometimes found to have certain disadvantages which more than counterbalance the simplicity with which they are managed, and the clean timber they invariably produce. Defoliating insects, which increase enormously during certain seasons, find in woods consisting entirely of their host plant, a veritable Arcadia until a corresponding increase of their own parasite, or the breaking out of disease, again, reduces their number to the normal. Parasitic fungi are also more troublesome in pure woods as a rule, owing to the rapidity with which the disease spreads from tree to tree, and the ground itself may become so infested with the mycelia of certain forms of fungi that great difficulty may be found in raising a young crop of the same or an allied species upon it.

With shade-bearing species which are comparatively safe from the above dangers, there is no necessity for the admixture of other kinds, and such species as Beech or Hornbeam always produce heavier and cleaner crops of timber when grown in pure woods. It follows, therefore, that the mixed plantation may or may not be justified from a sylvicultural point of view, according to the species employed, and their relative importance in the crop being grown. When light-demanding trees constitute the main crop, an admixture of shade-bearers is desirable for cultural reasons. When shade-bearers represent the species employed they are usually better without the presence of light-crowned trees, which allow light to penetrate the leaf canopy, and induce the growth of side-branches which produce rough timber.

Neither from the aesthetic nor from the economic standpoint, therefore, can any hard-and-fast rule be laid down for planting woods which are intended to combine the ornamental and useful. The method which probably comes nearest to accomplishing these objects, however, is that of grouping the selected species upon the various soils and situations best adapted to their growth. There is nothing new about this method, of course, and it is one very commonly adopted in the formation of large woods. But the amount of success attending it depends almost entirely upon the skilful manner in which this grouping is carried out. A succession of groups can become equally monotonous and tiring as the uniform mixing of species by individual trees, and abrupt changes in the cropping and type of wood without any apparent reason are as unnatural as the existence of fifteen or twenty different species upon an acre ground. A. C. Forbes.

(To be continued.)

STREPTOCARPUS AT OTE HALL.

THESE handsome early summer-flowering plants are being improved so much in the colouring and size of their flowers, that they are, in time, likely to rival the favourite Gloxinia; and in the estimation

FIG. 24.—A GROUP OF STREPTOCARPUS VARIETIES, AT OTE HALL, BURGESS HILL, SUSSEX.

potted, stake and tie loosely. They may be now permanently staged in a warm vinery, allowing the pots to touch each other so as to make the best use of the space. The best form of stage is built of large slates laid upon brick piers, covered 6 inches or more deep, with partially fermented horse-manure. This will exhale ammonia in small quantities when moist and warm, and on this the growing Vines feed by means of their leaves. Still continue to water with tepid water, to which later on may be added to a three-gallon water-can a handful of Thomson's or Clay's artificial manure. One may now expect a strong, healthy, rapid growth. Be very careful not to allow any of the foliage to scorch; syringe freely in the morning over the foliage, again at noon over the pots and stage, and finally, at night, before closing up, over all. I do not advise any shading, as this fosters the production of long-jointed shoots not approved of by Grape growers.

The insect enemies are the usual pests of the stove and greenhouse, and the worst perhaps is the so-called "red-spider," but there is little danger of an attack of any kind if healthy growth be maintained.

Very soon the canes will thicken and attain to the maximum growth of 6 or 8 to 10 feet. When this is

in the open; but this can safely be left to the intelligence of the grower. It is advisable to put a slate or tile under the bottom of each pot, to prevent earth-worms entering the soil from the bottom, and so souring it. You will now possess a batch of pot-Vines which may be used to fill up vacancies in the vinery, to force for early fruit, and to inarch on Vines which you may have already established, but which are not the sorts you desire. *Experience.*

(To be continued.)

FORESTRY.

MIXED PLANTATIONS.

(Continued from vol. xxi., p. 295.)

THE economic results from an ordinary mixed wood are usually almost as unsatisfactory as its ornamental aspect. Indiscriminate mixtures invariably produce too great a proportion of coarse timber to prove economical on a large scale, for that close canopy of foliage so essential to the proper cleaning of the stems cannot be maintained for any length of time when trees of different habits and rates of growth are mixed up together. Another dis-

of some to excel them in beauty, as they now do in the ease with which they may be raised and grown.

Our illustration (fig. 24, p. 85) shows three well-grown and abundantly flowered examples produced by Mr. C. Jones, sr. to H. Woods, Esq., Ote Hall, Burgess Hill, Sussex. These plants were four years old, and measured 3½ feet across. They were in 10-inch pots, and at their best at the end of the month of June last, and then possessed 150 more flowers than at the time the photograph was taken.

COLONIAL NOTES.

DIPTERACANTHUS SUBRINGENS, Nees.

THIS semi-climbing plant is most conspicuous when flowering. In the Botanic Garden, Grenada, it has been producing its large bright red flowers for many months past. It seems to thrive best under the shade of trees, and bearing this in mind at the time of planting it, we gave it a position against the trunk of a *Brownea coccinea* tree, planting it at its base. The shade given by this tree is fairly dense. The leaves of this semi-climber have prominent mesh-like vein markings underneath. It is a native of Brazil. (Kew).

CENCHRUS TRIBULOIDES, L., AND C. ECHINATUS, L.

The dissemination of seeds and fruit over various parts of the world is an interesting study; the influence in this respect the currents of the sea alone have, not to mention the modes of transference by animal agency, is truly wonderful. But what I wish to refer to at the present moment is the exceedingly uncomfortable position one is placed in when the burrs of these grasses (*Cenchrus*) get attached to the bottoms of one's trousers' legs, and then work upwards, pricking like needles into the soft, fleshy portion of one's legs.

C. echinatus is especially common in the Botanic Garden district, and whilst walking where this plant is growing, people are more likely than not to get into contact with its undesirable burrs, much to their discomfort and annoyance. I can call to mind no plant near at hand that is such a nuisance in this respect.

ARCHONTOPHONIX ALEXANDRE W. & D. (PTYCHOSPERMA ALEXANDRE, F. Müell.).

Owing to the effect produced by its flowers and fruits, this Palm must stand first among those other Palms growing in the Botanic Garden, Grenada. The masses of white flowers, shiny-green, and bright red fruits, are often present on the same trunk at the same time, and it is at such times as this that its full beauty is displayed. A native of Queensland.

DACRYODES HEXANDRA, Grisebach.

In Grenada there are two trees known as Gommier, the above-named is called Mountain Gommier because of its mountain habitat; and the other *Bursera gummifera*, a lowland and seaside tree, is distinguished as the Lowland Gommier. *D. hexandra* is one of the largest mountain trees that exist in the colony, and, as in the woods of the Grand Etang district, they assume in bulk of trunk gigantic proportions. The trunk if incised discharges a fragrant and a very inflammable gum, which is of a sticky and an adhesive nature. This gum is burnt in Roman Catholic churches, and is known as incense or gommier. The timber is cut up, and among other uses, is made into shingles for roofing houses, especially in the mountain districts. Its flowers, like the Nutmeg, are of two sexes, and are borne on distinct trees.

MICHELIA CHAMPACA, L.

We have no representative of the genus *Magnolia* in the Botanic Garden, Grenada, but we had flowering an allied plant in the above-named *Michelia* during the month of May this year. Its inconspicuous yellow flowers are powerfully fragrant, and pleasantly so from a short distance, but hardly agreeable when one is brought into close contact with them. Planted here and there, the air in the vicinity becomes

agreeably pleasant. Our trees now flowering, and also fruiting, are quite young, and are only from 6 to 10 feet high. "The tree is sacred to Vishnu, and is, therefore, an object of superstitious regard on the part of the Hindoos, who adorn their dark hair with the rich orange-coloured flowers."

RANDIA MUSSANDÆ, D.C.

Two years ago I brought seeds of this plant down from Belle Vue, a mountainous district in the parish of St. Andrew's, Grenada, some of which were distributed to correspondents in England, and elsewhere subsequently, and some were sown in the Botanic Garden. One of the plants raised is 4 feet high, bushy, and is in a vigorous condition. This was planted in the Botanic Garden, which lies a few feet only above sea-level, and to-day (June 8) opened its first flowers. At Belle Vue a cool atmosphere is continually felt, quite different to that of the Botanic Garden, especially during the dry season, and where the surroundings both in soil and climate are so contrary to those where the plant was obtained, and where it apparently was growing wild. This is another proof that plants brought down from the mountains will sometimes grow and thrive in open shore districts, but it is exceptional. The ground in which our plant is growing is thoroughly exposed to the mid-day tropical sun, and consists of a shaly substance, and consequently is in itself of a poor and unproductive nature. The flowers of *R. Mussandæ* are fragrant, with a slender tube 3 inches long, and the pointed petals pure white above; its leaves are small, and of a glossy-green, borne upon thickly-set branches. *W. E. Broadway, Grenada.*

ROYAL HORTICULTURAL SOCIETY OF VICTORIA.

It will be satisfactory to many who are interested in the colony of Victoria to learn that after the great loss sustained by the death of Baron Von Mueller the authorities at Melbourne set to work to reorganise their Royal Horticultural Society. Great satisfaction is felt at the appointment of the new Director, Mr. C. Bogue Luffmann, as a result of the recent competition for the post. The gardens and experimental grounds, which cover 42 acres, have the advantage of being watered by the river Yarra. The duties of the Director include the delivery of public lectures, and the training a limited number of students, and he will be ably assisted by Mr. McAlpine, Government Pathologist; Mr. French, Government Botanist, and other distinguished men. The extensive gardens will afford Mr. Luffmann scope for turning to useful account his world-wide knowledge of horticulture. *W. Roupell, Streatham Hill, S.W.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

The Double-flowered White Rocket.—This old-fashioned border-plant is deserving of general cultivation, producing its fine spikes of double, pure white, and fragrant blossoms in profusion, and usually towards the end of May, and continuing in flower more or less for at least two months. When allowed to stand for several years without removal, the clumps dwindle, and the flower-spikes become short, and sparsely set with blossoms; but when they are lifted annually, divided carefully, and re-planted, its vigour is maintained. It is also advisable to grow some plants of it in the reserve-garden, where propagation can be carried out without being obliged to have regard to appearances; and the change from the soil of the reserve-garden to that of the flower-garden borders is always of service in maintaining the stock of plants in good health. Dry and hot summers have sometimes disastrous effects on Sweet Rockets unless water can be freely afforded them. The plants are also subject to a disease, or rust, similar in appearance to that which has rendered Hollyhock culture difficult; and when nothing is done to check the disease, the plants succumb, and the older the sooner. The flowering of this plant being nearly over, it is now the proper season to take up the plants, and divide and re-plant them. In the present

state of the weather, it would, however, not be advisable to do this, but to wait till dull or showery weather ensue, before undertaking the operation. If the old flower-spikes have been cut down as they have gone out of flower, many growths will have come from the base, which afford a ready means of propagating the plant. The remaining flower stems may be cut off, the plants lifted, and the young growths pulled into pieces, each with some roots attached, and be planted in a new position in the borders or in the reserve garden. If no change of ground can be afforded, a heavy dressing of rotten manure should be dug in, with a small quantity of new loam added, which will enable the plants to get a good start. Afford water copiously to settle the soil about the roots, and sprinkle the leaves occasionally late in the afternoon till the plants are established.

Hints on a Variety of Operations.—At the time of writing the great heat and excessive drought are distressing many kinds of plants in the flower garden and flower borders, and although *Pelargoniums* are a blaze of colour, shrubby *Calceolarias* although flowering perfectly are beginning to give out, and here and there a plant is dead or dying, it will do something to relieve them if spent flowers are removed, and water be copiously afforded at the root, following the first application with a mulch 1 inch thick of half-rotten leaves or coco-fibre. *Heliotropes*, tuberous *Begonias*, *Fuchsias*, *Verbenas*, *Violas*, and subtropical plants generally should also be well supplied with moisture at the root. The flowers of the Sweet Pea are very short lived in hot weather, and in order to keep up a succession of flowers, the seed-pods should be removed as soon as the flowers drop. Trees and shrubs planted last winter and spring will be sure to require water at the root, and an occasional overhead syringing will do them much good, preventing a check to growth both at the roots and at the top. If mulching was not applied after planting, litter or rotten-manure should now be placed over the roots. Earwigs are sure to infest the Dahlias, and should be constantly caught in bean-haulm and pots of hay placed on the top of the Dahlia-stakes, or fixed on the top of shorter stakes placed out of sight among the plants. A daily examination of these traps should be made for captured insects. Do not let the Dahlia plants become a tangle of shoots, but thin out the latter; and to increase the size of the double flowers a certain amount of disbudding should be practised. Let each plant have a basin 2 feet wide and 3 inches deep made with the draw-hoe, that is drawing the soil to a depth of 1 inch outwards from the plant, and form a wall with this 2 inches high; and during the hot weather, once a week, fill this space with water and occasionally with manure-water. If the ground be neatly raked, and a crumbly tilth maintained by using the Dutch-hoe, much of the moisture in the soil will be preserved, and the plants grow vigorously accordingly.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

Phalenopsis.—The earlier-flowering species, viz. *P. amabilis*, *P. Schilleriana*, *P. Aphrodite*, *P. Stuartiana*, *P. Sanderiana*, *P. intermedia*, and *P. leucorhoda*, the leaves of which will have made much progress, will need for some time longer to be kept moist at the root. The chief cause of failure with *Phalenopsis* may be traced to their being kept in saturated materials, and in a very hot house that is ill ventilated. As a matter of fact, the plants require fresh air during the present season, in which growth is chiefly made, when the outside air is sufficiently warm not to chill the plants. Ventilation is best effected by opening the lower ventilators a little early in the morning, and when the inside warmth increases, gradually admit more fresh air. If practicable, the upper ventilators should be made use of during the middle hours of the day, so as to get rid of superfluous moisture; and if the warmth should then decrease, or there is any draught, the bottom ventilators should be closed wholly or partially. A high sun-heated temperature is good for these plants; but artificial heat, if used to any great extent, soon weakens them. It is well, therefore, to close the house early in the afternoon, well damping the floors, stages, &c. During such warm weather as that at present prevailing, the bottom ventilators may be opened a small space the last thing at night. All of the species do most satisfactorily when hung up near the glass on the north or shady side of a house where there is plenty of subdued light, but no direct sunshine reaches them. Suspension not only favours and induces the

tion of stout leaves, capable of enduring their time, but slugs and cockroaches cannot reach

If the sphagnum-moss about the plants is ing, it should be picked out from between the and replaced with fresh. *P. Luddemanniana*, *trapsis*, *P. Maria*, *P. violacea*, *P. speciosa*, *P. rana*, and *P. cornu-cervi*, which have recently ed flowering, should be placed in new baskets. oiage of these green-leaved varieties soon loses h glossy colouring, and gets shrivelled and un- ay-looking if exposed to strong light, and from i, even with the best kind of treatment, it takes e time to recover. To obtain the best results, a on should be selected in the East India-house or stove, where, in addition to the ordinary shading e, the glass immediately above the plants should inted with green "summer cloud," or if prefer- a piece of thin shading material permanently d on to the roof and kept there till the sun has s ardency. Other species of Orchids thriving in ilar position, are *Batemannia Burti*, *B. Colleyi*, *strea Klabochorum*, *P. Lehmanni*, *P. Dayana*, *rina*, *Huntleya Wallesiana*, *H. meleagris*, *Bollea tis*, *B. Schroderiana*, *Warszewiczella Wend-* *W. discolor*, *Stenia (Chondrorhyncha) fimbriata*, *estertonii*, *S. pallida*, *Phaius tuberculatus*, *Angra- Kotchyi*, *Thrixpernum Berkeleyi*, and *Kefer- a graminea*.

the cool (*Masdevallia*) house at Burford Lodge, pretty Orchids are now flowering, viz., *Odonto- ara aspidorhinum* and *Promeneia citrina*, either ich would be a nice addition to any collection of ds. The *Odontoglossum* requires to be grown pot raised up to the roof. It is a very free ring and easily-cultivated plant. The dwarf lenoca succeeds best in shallow pans, in well- ed peat and sphagnum-moss, and hung up along- of *Odontoglossums Rosii* or *O. Cervantesii*, and ed exactly like those. The pretty *Angraecum um* and *Aerides japonicum* should, whilst this eather lasts, be accommodated in the coolest

THE KITCHEN GARDEN.

By W. POPK, Gardener, Highclere Castle, Newbury.

celery.—There should be no delay in proceeding the moulding-up of the earliest crops. Blanched y being in much request late in the month and eptember, a month is not sufficient time in h to blanch the sticks of it for use as a salad. e who prefer the method of earthing-up piece- should now afford the final earthing to the et rows; whilst those who apply the first ment of soil should water the trenches copiously der that there may not be any check induced yness at the root whilst blanching is in progress. ed, the great objection to the old-fashioned plan adually earthing-up the plants is the impossibility applying water afterwards, and whilst growth is progressing, added to which is the evil of some- e burying the heart's leaves too deeply, thus ng early decay. If earthing be delayed till the s have reached full size, time and labour are omised, and the foregoing disadvantages obviated ording one earthing-up instead of several; but very necessary to examine the plants, and secure eaves against the wind by loosely binding them her with broad strips of matting occasionally. re beginning to earth-up a row, it is a good prac- to strew quicklime freely along on both sides of row, doing this two or three times whilst the ing-up is in progress. By doing this, slugs and ns are kept away from the plants. For exhibi- purposes, bindings of brown or water-proof paper very generally preferred. At this season four to weeks should be allowed for perfect blanching, at for late autumn shows six weeks is not too a time. Should the Celery-fly be noticed on plant, dust the leaves lightly with fresh soot in early morning occasionally, but if they have dy been at work, which will be seen by the n spots appearing here and there on the foliage a containing a maggot) search for the maggot and h it between the finger and thumb, or pick off affected part of leaf, and burn it.

potatoes.—The early varieties are now sufficiently ared in some parts of the country for digging storing, and as wet weather may occur and set up often does, the ordinary disease of the Potato, all y varieties should be stored whilst the weather ins dry. Do not store the tubers in bulk ediate after digging them, but spread them y for a time in a cool, dark yet airy place. e intended for sets another year need not be

kept in the dark, although they should be placed under cover.

Winter Greens, or Kale.—If the planting out of these vegetables is not completed, it should be done forthwith, and the lifting of the early Potato crop will afford the land for the purpose if it be levelled and drills drawn on which to plant with a long dibber. Should the plants have been raised in nurse beds, lift them carefully with a trowel, and plant with the same implement, affording water copiously soon afterwards. Earlier plantations should be hoed to keep a crumbly tilth, than which nothing conserves the moisture in the ground better, and a little later earthing up may be done. The Asparagus Kale, otherwise Buda and Jerusalem Kale, is a particularly bardy, well-flavoured kind that keeps till the spring, and is one to plant in quantity.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

The Fruit Room.—Whilst there is yet time, and early Apples such as Mr. Gladstone, Juneating (red), Beauty of Bath, Irish Peach, Astrachan (red), and Keswick Codlin (Apples), and of Pears Early Benoit, Citron des Carmes, Clapp's Favourite, Jargonelle and River's Beacon, are still on the trees, whitewash with fresh lime the walls and ceiling, and scrub the woodwork with soapsuds, and leave doors and windows open day and night till the fruit is placed in it. A little size should be dissolved in hot water, and put in the lime-wash before applying it to the walls, &c., so as to prevent the lime coming off when touched.

Preserving Fruits.—Apricots and the true Green-gage Plums should be gathered in due time for preserving and bottling. Pond's Seedling, Monarch, Kirk's, Belgian Purple, Diamond, and similar culi- nary varieties, should be gathered for bottling. Peaches and Nectarines are similarly treated, and where this is done care should be exercised in send- ing in a due supply of both fruits for jam and bottling when most plentiful during the present month.

Morello Cherries where preserved in brandy, &c., should be seen to before they get too ripe, selecting the finest fruit—which should be firm and well coloured—for this purpose. Ample supplies of Gooseberries and red Currants should be sent to the stillroom, the former for jam, &c., and the latter for jelly and bottling. A good breadth of red Currants should be netted over for meeting the daily demand for red Currant tarts as long as the fruit can be had fresh from the trees, which may with care be ex- tended into the month of September.

Autumn-bearing Raspberries and Strawberries should be afforded good supplies of water at the roots as often as circumstances permit, in order to swell and perfect the fruit. Where there is a good supply of water at command, and sufficient labour to apply it to fruit trees in general and most garden crops during the hot weather, great benefit will accrue.

PLANTS UNDER GLASS.

By G. H. MAYCOCK, Gardener, Luton Hoe Park, Luton.

Lachenalias.—The tubers may now be potted or placed in baskets, as after this date the roots become active, and it is very essential that the operation of potting, &c., be finished forthwith. The tubers should be shaken out of the old soil, and placed in a compost consisting of loam four parts, leaf-mould and well-decayed manure each one part, and plenty of sharp sand. If pots of 5 inches in diameter be used, a dozen tubers can be readily accommodated in each, these being sized before potting them. Let the pots be well crocked, and after potting the tubers, stand the pots on a cool bottom in a greenhouse or cold frame, affording no water till it is seen that root- action is advancing. *Lachenalias* form splendid sub- jects for planting in baskets for greenhouse decora- tion, and considering that the plant is easily grown, it is a matter of surprise amateurs and professionals do not grow it more commonly. In preparing a basket, first line the sides all round with living sphagnum-moss, and then proceed to fill in the soil by degrees, inserting the tubers at a variety of depths as the soil rises in the basket, and in such a manner that the growths will readily push their way through the meshes of the wire-work, and finish off the same as with pots. Baskets when finished may be sus- pended at the first on the shady side of a cool green- house or fernery, but when growth has begun, more light is needed, but cold draughts must be avoided

or the foliage will get disfigured. The most suitable varieties for baskets are *L. tricolor*, *L. Nelsoni*, *L. pendula*, and *L. luteola*.

Kalanthes (Crassula) coccinea and others.—If growth for the season is completed, remove the plants to a coal-ash bed in a sunny position out of doors, the foot of a wall having a glass coping being a capital place for them; the aim of the cultivator being to mature the wood perfectly, and with this intent they should be kept rather dry at the roots, but not so as to cause flagging. About the end of September they must be again placed under glass in a dry airy pit, only sufficient fire-heat being afforded as will exclude frost.

General Work.—Gradually withhold water from *Amaryllis* as the leaves begin to turn of a yellow tinge. Pot up batches of Roman Hyacinths for early forcing; and if large quantities of bloom are required for cutting, some part of the stock of these bulbs may with economy of space be placed in boxes, those in pots being used for decorative purposes.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Ledbury.

Tomatoes.—Keep the plants in full bearing and good health by applications of manure-water and top- dressing of loam and dung. Remove all weak growths, and some of the foliage, so as to expose the fruits, but tie in sufficient growth to keep the trellis covered nicely with foliage. Young plants for autumn and winter fruiting may still be planted if a constant succession of fruit is required, encouraging the plants to make sturdy growth, but not affording manure till a good crop of fruit has set. [Mr. Harris writes that he has been ill, and unable to supply his Calendrical article as usual. Ed.]

A NOVEL BOTANICAL COMPETITION is de- scribed in the current issue of *Science Gossip*, and the editor of that paper is of opinion that it will provide valuable scientific records of the growth and habits of plants not generally recognised, as well as amuse- ment. Three photographs, not exceeding half-plate size, are to be taken of uncommon, local, or rare plants: (a) best showing the habit of growth when flowering, fruit, or otherwise; (b) of the growing plant and its immediate surroundings; (c) of the near landscape to show the character of the plant's station. Two prizes (books to the value of 50s. and 30s. respectively) are offered, and the chief points to be considered in making the awards will be (a) the variety of the species photographed; (b) the grasp of detail, such as the natural position, the flowering parts and other surroundings, in case any appear; (c) the excellence of the photography. Any kinds of plants are available for the purpose of the competition, including Ferns, mosses, fungi, marine Algae, &c. *Pharmaceutical Journal*.

CARRIERS OF COMMERCE.—In our issue for June 19, under the heading "Then and Now," we placed in contrast the trade returns of 1837 and 1897, clearly showing the enormous increase in both imports and exports—the growth of a peaceful reign of sixty years. But no attention was paid to the increase in the carrying power of our mercantile navy. This has been simply enormous. Taking up the Naviga- tion Returns for the past year, we find the tonnage of the ships entered with cargoes from foreign countries and British possessions is placed at 33,479,592 tons; the tonnage cleared being 37,703,217. These figures may be again divided as follows:—Entered from foreign countries, 28,677,465 tons; from Brit- ish possessions and colonies, 4,802,127 tons. The tonnage cleared was, to foreign countries, 32,111,158; to Briti-h possessions and colonies, 5,592,059 tons. The details respecting the ton- nage employed in the first year of the Queen's reign are meagre, but they are wonderfully sug- gestive. The entries are 3,215,829 tons; the clear- ances foot up 2,578,018 tons—these figures repre- senting both foreign and colonial trade. It should not be overlooked, that one steamer now-a-days often does the work of half-a-dozen sailing ships—its tonnage counting at every entry and clearance; all the same, the figures are of so stupendous a character and value as to warrant special attention being drawn to them in this place.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

PROVINCES.—August 4 (6 P.M.): Max., 79°, at York; Min., 58°, at Sumburgh Head.

As the Royal Horticultural Society has now held examinations in horticulture for five consecutive years, it may not be uninteresting to compare the results obtained, and see what progress has been made. As percentages alone can give strictly accurate comparisons, the following table will be found, so to say, almost to speak for itself; but there are some points to be especially noted—

	1893 (204)	1894 (120)	1895 (169)	1896 (152)	1897 (144)
1st Class	5.8	8.0	7.1	10.5	48.3
2nd Class	17.4	29.3	21.1	34.8	29.8
3rd Class	36.2	37.3	43.2	32.3	15.2
Not Classified	40.1	26.2	27.7	22.3	6.5

As might have been expected when it was first proposed to hold an examination in the Principles and Practice of Horticulture, the examinees did not know what would be expected of them, nor what sort of questions would be set for them to answer, nor probably the limits of their own knowledge; consequently, we are not very much surprised to find 40 per cent. were not classed at all, as obtaining less than one-third of the total number of marks obtainable (300). A larger number entered for the first examination, than in any subsequent year—probably from the reasons given above. Another natural result was the very small percentage of first-class students* (5.8) and the

high one of the third, viz., 36.2, the proportion therefore between these classes being as 1 to 6.

It is probable, as before stated, that in the first year many entered quite unprepared for the examination. This is seen in the large entry of 204, of which nearly one-quarter were rejected, and it is illustrated by the following replies which were received on that occasion:—

"Plants take the nourishment from the ground to keep it alive. And it does keep on spreading about as the plants do grow up and straight out."

"The wireworm is a worm that is about when it does rain and eat a lot of things and destroy them like the slugs do."

"The wireworms is one of the most dangerous animals we have to plants; if it should happen to discover the plants they will destroy all."

"Plants take from the soil lime, magnesia, iron, phosphorus, potash, sulphur, which is the white part of the ashes. It is taken up by the carbon of the air igniting all these other chemicals together and taken up as plant food."

In the second year (1894), the public having had an opportunity of seeing the questions set in the previous year, and the examinees themselves of being tested, a smaller number of candidates presented themselves (126), and a much smaller proportion were unclassified (26.2 per cent.). Moreover, the number of the first-class students rose from 5.8 to 8.0, and that of the second class from 17.4 to 29.3; the proportion of first to third being now 1 to 5.

In the third year (1895) a curious lapse took place. Just as in 1893 there was a large supply of mediocre talent, the total entry being again large (169); so again, the results were repeated, though in a less marked degree. Thus we find a slight decrease in the first class, a still greater one in the second, while the third class has increased; the proportion between the first and third having returned to that of the first year, or one to six. The amount unclassified is nearly the same, however, as in 1894.

In 1896, we seem to start on somewhat fresh lines. The "boom of mediocracy" of 1893 and 1895 is rapidly disappearing, and we now see a decided turn of the scale for the better. Comparing the results of 1896 with those of 1895, the first class shows marked increase, while the third has decidedly diminished, the proportion of these two classes being now as 1 to 3.

In the present year (1897), though the entry (excepting that of the first year) is larger than ever, yet the high standard begun in 1896 has not only been well sustained, but greatly exceeded. The first-class has suddenly risen from 10.5 to 48.3 per cent., while the third has fallen from 32.3 to 15.2 per cent., the proportion between these two classes being actually reversed, or 3 to 1; for last year it was as 1 to 3. The number of unclassified (6.5 per cent.) is fast approaching zero.

It is somewhat difficult to account for the astonishing improvement in the present year. Had the paper been particularly easy and simple, of course, more questions would have been answered well; but they do not seem to be of a different standard from those of previous years. Hence, we must look to the students themselves, and this is very encouraging. Looking at the numbers unclassified (excepting the year 1895), they have steadily declined from 40 to 6½ per cent.

At the same time, it must be remembered that a large proportion of the candidates had been trained at Swanley or at Chelmsford, and whilst the result is highly creditable to the tuition

given at those establishments, it shows how unfair is the competition to those who have not had similar advantages. Making all due allowance for these circumstances, the number of first-class certificates given this year seems still wonderfully large, and suggests some lowering of the standard on the part of the examiners. This is particularly shown in the fact that one of the candidates is actually credited with the full number of marks.

We have, of course, no knowledge of the paper in question, but long experience in examining, and a large acquaintance both with examiners and examinees lead us to the belief that no examination-paper on such a subject as horticulture, could be so absolutely perfect as to merit the full number of marks. Here, perhaps, the "personal equation" comes in, and the standard set up by one examiner differs from that adopted by another. In any case, a few marks more or fewer does not affect the general result, which is highly satisfactory.

The entry dropped to 126 in 1894; but the increase now appears to be steadily progressing, accompanied, however, by vastly improved results. These comparisons give one the impression that the examination is valued, and that young men and women are determined to get as well placed as they possibly can. Perhaps a few more prizes, if any one will generously offer them—say, for the head student of each class—might be further encouraging, and very acceptable.

It is suggested in some quarters that the examination should be made more practical, and that the technical details of manipulation should be assessed as well as the knowledge which can be obtained from books or lectures. From this point of view the following considerations present themselves:—First, the examination is intended for students and beginners, not for experts. Long practice alone can make an expert. All that an examination under the present system can do is to test the intelligence of the candidate, and ascertain how he has been trained in the acquirement of that knowledge which will be of service to him in his future career as a gardener.

And then, again, the training that a young man gets at a horticultural school is distinctly practical. If it were not so, Swanley and Chelmsford students would not take so high a place in the class-lists as they do. Well grounded as we must assume these students to be, and familiarised with practical detail as much as possible, it is still clear that experience alone can make them good gardeners. Trained as they have been, they should acquire that experience much more quickly and easily than if they had not had the advantage of acquiring useful knowledge. It remains now for the candidates to apply and make use of the knowledge they have gained. If they are incapable of doing this, their tuition has been vain, and they will never rise beyond the rank-and-file. But if to the education they have had, they now add the lessons of practical gardening in properly-equipped garden establishments, they should be capable not only of securing their own advancement, but of doing their share in the promotion of horticulture in general. Of course, very much depends on the character of the individual, and we do not know of any mere examination, whether of student or of expert, that would be of any use as a test of character. Having given the lad the best and most complete training that is possible, it must rest mainly with the individual as to what use he will make of it.

* In this first examination there were two grades; for comparison, the numbers in the first, second, and third classes are added together, respectively.

AMES SENDALL & CO., Ltd., CAMBRIDGE.

MANUFACTURERS OF FIRST-CLASS HOUSES FOR NURSERYMEN,
MARKET GARDENERS, AND OTHERS.

No. 88.—A COMPLETE HOUSE, 25 feet long by 12 feet wide, for £20.

(The Largest, Best Made, and Cheapest House ever offered for the money.)

These Houses are intended for those who require a large house for little money. The sides and ends are framed 2 ft. 9 in. and covered in weather-boards. A door is supplied for one end, with strong hinges and good lock. The roof is framed strong ironwork; ventilators on both sides of the roof to open by levers. The wood is best quality red deal, painted twice inside and out, 21-oz. ENGLISH-MADE GLASS cut to sizes. Every part is fitted and finished off ready to fix, and all bolts, nails, required in fixing are included. Any handy-man can erect these houses.

verhampton. Maker to The Queen and Prince of Wales.

FIG. 25.—A GROUP OF FOLIAGE AND FLOWERING PLANTS, WITH POOL AND WATER-LILIES.

(Arranged in the Queen's Tent on the occasion of a recent visit of Members of the House of Commons to Windsor. See p. 89.)

GROUP IN THE QUEEN'S TENT, WINDSOR, IN JULY.—Our supplementary illustration affords an idea of a novel kind of group erected by Mr. OWEN THOMAS in the Queen's tent on the occasion of the visit of the members of the House of Commons to Windsor in July. The pool and fountain with Water Lilies in flower, and other aquatics, was a happy thought of the Royal gardener, suggestive of coolness, and the predominance of foliage over flowering plants in the surrounding group gave additional force to this idea.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees of the Royal Horticultural Society will be held on Tuesday, August 10, in the Drill Hall, James Street, Victoria Street, Westminster, from 1 to 5 P.M. A Lecture on "Cross Fertilisation of Florists' Flowers" will be given by Mr. JAMES DOUGLAS, at 3 o'clock.

"BOTANICAL MAGAZINE."—In the August number of this ever-valuable periodical, edited by Sir JOSEPH HOOKER, the following plants are figured and described:—

Lycoris squamigera, t. 7547, differs from *Amaryllis* in its black seed-coat. It is a bulbous plant, native of Japan, and much resembles *A. Belladonna*. It is grown at Kew in an open border against the south wall of a stove. (See *Gardeners' Chronicle*, 1897, i, p. 137, fig. 38.)

Gasteria fusco-punctata, t. 7548 (the text accompanying this plate is by error marked 7549.—We follow the numbering of the plate rather than of the text). *Gasteria fusco-punctata* is a handsome species with broadly lanceolate fleshy leaves, glaucous-green spotted with brown, and erect branching panicles of pink flowers.

Dendrobium denudans, t. 7549 (by accident the text is indicated as 7548).—A native of the temperate Himalayas. It has small, slender pseudo-bulbs, deciduous linear oblong leaves, and axillary nodding racemes of whitish flowers; the front lobe of the lip is 3-lobulate, the margins coarsely toothed.

Ficus erecta var. *Sieboldii*, t. 7550.—Dr. KING describes this species as excessively variable; the form here figured is of Japanese origin, and has relatively shortly stalked, linear lanceolate entire leaves, with an occasional tendency to lobation; fruits club shaped, orange.

Oncorchis purpurascens, Lindley, t. 7551.—A tuberous Orchid from the Mascarene Islands: the leaves are solitary lanceolate; the flowers, one or two in number, are borne at the end of a long slender erect stalk. Each flower is about 1½ inch in its longest diameter, sepals and petals small, lip projecting, conspicuous, three-lobed, rosy-lilac in colour, and provided at the base with a long spur. Sir JOSEPH HOOKER points out its close resemblance to *Habenaria*.

ROYAL BOTANIC SOCIETY.—At the annual meeting to be held in the Gardens, Regent's Park, on Tuesday, August 10, Mr. J. S. RUBINSTEIN will, pursuant to notice, bring forward motions recommending the Council (a) to establish classes in the gardens for the study of botany, to be open to all students; (b) to invite the Royal Horticultural Society to confer as to the feasibility of effecting a union of the two societies; (c) to increase the facilities for the holding of exhibitions, garden-parties, or receptions in the Gardens by local authorities and by leading societies and institutions. The meeting will be held in the Gardens at 1 P.M.

THE TEMPERATE-HOUSE AT KEW.—The new wing of this house was opened on Sunday last. It is 114 feet in length and 63 feet wide, according to the measurements given in the *Journal of Horticulture*. We shall take an early opportunity of advertising to this important but long-delayed addition to the Royal Gardens.

RATING OF GLASSHOUSES IN NURSERIES.—We regret to have to call attention to the Rating Case reported in our Law Notes. Hitherto gardeners have relied on the Worthing Case as their charter in such matters, but we must now await the result of

the Appeal before we can know what the law really is. The judges seem as much perplexed as other people for the two learned brothers came to opposite conclusions in their interpretation of the Act of Parliament. These delays, and still more these uncertainties, inflict cruel injustice on the cultivators. The Market Gardeners', Nurserymen's, and Farmers' Association has charge of the interests of the market gardeners in this particular case.

THE HISTORY OF THE SWEET PEA.—In the *Florists' Exchange* for July 17, Mr. S. B. DICKS contributes an article on this subject, with illustrations copied from some of the older books. Mr. DICKS traces the Sweet Pea to JOHN BAUHIN'S *Historia*, 1650. The plant itself is a native of Sicily, but one form of it was considered to have come from Ceylon, and was accordingly called by BURMANN *Lathyrus zeylanicus*. The word "nobis," which has misled Mr. DICKS, of course applies to BURMANN himself! How the mistake arose of considering the Sweet Pea as a native of Ceylon, we cannot tell. For those with leisure it would, no doubt, form an interesting subject of enquiry. It is certain that neither BAKER, in HOOKER'S *Flora of British India*, nor TRIMEN in *Handbook to the Flora of Ceylon*, admits the plant as a native of the island, though it is likely enough to have been taken there.

THE GIANT PRIMROSE.—Under the name of "Evelyn Arkwright," this form of the wild Primrose, remarkable for the size of its blossoms, which measure from 2½ to 2½ inches in diameter, is being distributed. Application should be made to Mr. PARR, Estate Office, Hampton Court, Leominster, Herefordshire.

THE YORKSHIRE COLLEGE, LEEDS.—Dr. JAMES CLARK, who has been successfully engaged for the past six years in University extension work in agriculture and horticulture, was in March last offered and accepted the Professorship of Agriculture in the Yorkshire College, and the Directorship of the Agricultural department. It is the intention of Professor CLARK to introduce regular horticulture into the college curriculum. Below is a prospectus of a short preliminary course on fruit culture which has just been completed:—

SYLLABUS OF LECTURES.—The tree and its requirements, including food, moisture, air, light, and heat. General effects produced by excess or deficiency of these necessary conditions of growth. Uses of the different parts of the tree, with a review of the way in which each part performs its work in relation to the rest. The relations between roots and soil.

The growth of the tree. Leaf-buds and flower-buds. Development of the branches. The ripening of the wood.

The flower and its parts. Fertilisation. The growth of the fruit.

Preparation of different classes of soil for fruit culture. Precautions against unfavourable conditions. Selection and planting of fruit-trees. Choice of position. Peculiarities of the different stocks in common use. General characteristics and treatment of Apples, Pears, Plums, Cherries, Gooseberries, Currants, Raspberries, Strawberries, Vines, and Peaches. Choice of varieties to suit local conditions.

Principles of pruning, branch and root. Training of fruit-trees. Propagation of fruit-trees.

Principles of manuring. Characteristics, properties, and uses of farm-yard manure, and of the artificial manures most serviceable in fruit culture. The mixing of manures.

Diseases and insect-pests; precautions, modes of prevention, and remedies.

The gathering, storing, grading, and marketing of fruit.

THE CHERRY CROP.—The *Sussex Daily News* of July 31 says, that Cherry-picking is practically finished in Kent. The crop has been a great failure, the yield being so scanty on many trees that the fruit was not gathered at all, as the labour entailed would have exceeded the value of the cherries. The prospects are fairly good as regards Plums and Apples, except superior kinds, which will be scarce. Harvesting has commenced in the Amberley district. The crops are heavy, and already a good deal of Wheat has been cocked.

RAVENS COURT PARK, HAMMERSMITH.—A new portion of the park facing the high-road, and which three years ago was covered with Nettles, has been converted by Mr. W. B. GINGELL, the Superintendent, into a delightful garden, containing

several very noticeable happy combinations in the borders; as, for instance, *Corylus avellana purpurea* (the Purple-nut), and *Acer Negundo variegatum*; *Prunus Pissardi*, purple-leaved Plum, mingled with that capital town-plant, the Golden-leaved Privet. A bed filled with *Pentstemons* of the new type attracts much attention from visitors. One of the very best of the yellow-flowered bedding *Violas*—Bullion—is effectively used as a ground-work plant beneath *Lobelia cardinalis* Queen Victoria. A scroll, formerly devoted to carpet-bedding is now planted with tuberous *Begonias*, which are flowering with remarkable freedom. *Fuchsias* are effectively used in the various portions of the park set apart for flower-gardening purposes.

ISLE OF WIGHT HORTICULTURAL SHOWS.—During the last week in July there were four cottage garden shows in the rural parts of the garden Isle:—Brightstone on July 27, where there was an excellent show of fruits, flowers, vegetables, and plants. This picturesque and fertile district is capable and does produce some fine horticultural productions. The inhabitants are greatly encouraged in this work by Sir Chas. Seely, Lady Mary Gordon, Rev. G. E. Jeans, and the Rev. L. B. Morris, not only by pecuniary aid, but by staging exhibits of a high quality not for competition, but as a standard for the cottagers to aim at. Arreton show was held on July 28, when the exhibits were not so numerous as in former years, but a great advancement in the standard of excellence was made. Carisbrooke and Northwood shows were held on July 29. The competition was keen at both shows. The table decorations at Carisbrooke were well done, and reflected great credit on many of the exhibitors for their taste. The Isle of Wight Horticultural Improvement Association awarded their Certificate for Cultural Merit to Mr. A. Went of Brightstone, Mr. Geo. Lipscombe of Arreton, Mr. W. Matthews of Carisbrooke, and to Mr. A. J. Philpot of Northwood.

NEW GOOSEBERRIES.—Do not think, gentle reader, that Messrs. VITCH or their expert hybridiser, Mr. SEDEN, confine themselves to the raising and rearing of extraordinary Orchid hybrids. No; they are not above improving the humble Gooseberry, and two specimens before us show that they are quite equal to the production of extraordinary Gooseberries—appropriate to the season. "Langley Gage" is one with fruits rather more than 1 inch in long diameter, oblong, yellow, slightly hairy, and with a sweet flavour, agreeably mixed with a suspicion of acid. Langley Beauty is more fitted for the exhibition-table, having large oblong or roundish yellow berries, 1½ inch in length, slightly hairy, and with an agreeable flavour. We cannot say anything as to their habit and productiveness, but the fruits are first class.

ROBINSONELLA.—Under this name, Messrs. ROSE and E. G. BAKER describe some arborescent malvaceous plants, which are representatives of a new genus. *R. cordata*, *R. divergens*, and *R. Lindeniana* are natives of Mexico (Oaxaca), Costa Rica, and Vera Cruz respectively. The plants are figured and described in the number of the *Garden and Forest* for June 23, 1897.

NEW VARIETIES OF BEDDING VIOLAS.—We have lately received from Mr. J. GRIEVE, of Redbraes Nursery, Broughton Road, Edinburgh, two varieties of bedding Viola, so good in colour that they are worthy of special notice. One, named Joseph, is of a purplish-brown, the sender calls it bronzy-brown, of a rich shade, admirable as a filling for small beds, or a band of colour round some yellow coloured flower, say a Pansy, *Gazania uniflora*, Haage's dwarf Zinnia, or a dwarf *Calceolaria*. The other variety, Lady McDonald, has yellow blossoms rayed slightly with purple, but not sufficient to spoil the effect of the yellow colour when viewed at the distance of four feet. It is said to possess a good habit, and to be very free flowering. In all the cooler parts of this country, and of course almost anywhere in Scotland, Violas are capital spring and summer flowers. On the cool, moist, green sand and chalk formations, where these approach the surface, and on heavy

leams and clay soils, *Violas* grow and flower well through the summer; but on dry soils and in dry districts and situations, unless much heavy loam and rich manure be incorporated with the staple, the results are apt to be disappointing after May is out.

EDINBURGH SCHOOL OF RURAL ECONOMY.—The Prospectus of the Edinburgh School of Rural Economy for the Session 1897-98 has now been issued. The courses of instruction arranged for this Session are similar to those of last year. Their main features are:—1. A Two Years' Curriculum of Day Classes in Agriculture and allied Sciences; 2. A Course of Day Lectures on Forestry in the University; 3. An extensive series of Evening Classes on Agriculture and allied sciences, embracing Horticulture and Forestry; and 4. The usual Summer Vacation Classes for Schoolmasters, which have been well attended. The work of the first session, embracing mensuration, mechanics, elementary physics and chemistry, botany, book-keeping, drawing and handicraft, practically completes the preliminary education of the student, and gives him an adequate knowledge of the elements of the sciences that have a direct bearing on agriculture. At the same time, his interest in the practical aspect of his work is maintained by such class exercises as those in measuring buildings and fields, in making drawings of these to scale, in woodwork, and in the application of physics in agriculture. The subjects of study in the second session are agriculture, agricultural chemistry, botany, zoology, and entomology; veterinary science, and forestry. The complete course thus aims at fitting a young man to enter with intelligence into his work as a farmer, a gardener, or a forester. It should enable him to understand the greater part of the work that he will see in practice, and to study for himself any special subject that he may afterwards find to be of importance to him. A student who has satisfactorily completed the two years' course of study, and who has had the required experience of practical work on the farm or in the forest, should find himself sufficiently prepared for the examination for the diploma of the Highland and Agricultural Society. Numerous and varied evening classes are provided for those who are otherwise engaged during the day. A specially moderate scale of fees has been arranged. This will be indicated by the fact that the inclusive fee for the first year's entire course in agriculture is five guineas. Copies of the Syllabus are to be had from the Secretary, 3, George IV. Bridge, Edinburgh.

"PAYING PLEASURES OF COUNTRY LIFE" (GEORGE ROUTLEDGE, London, Manchester, and New York), a volume treating of the profitable cultivation of vegetables, by H. W. WARD; of fruit growing, by HARRISON WEIR; poultry keeping, by W. B. TEGE-MEIER; poultry rearing and fattening, by R. L. EVERETT; pigs, by SANDERS SPENCER; flower culture and bees, by R. BEALE; and rabbit-warrens for profit, by Major MORANT. This list of the subjects dealt with, and the names of the authorities, will show our readers what to expect; reliable information by competent writers. Of course, where so many "pleasures" are under consideration, it has been found impossible to deal with any at great length, so that the chief use of the book should be to suggest profitable employments, giving such hints about them as will show the reader whether or not they are suitable to himself; what are the principal features of them, and so on. All these out-door occupations are, as the book tells us, more or less dependent upon our variable climate, upon which, however, too much stress may be laid, with the result that foreign competition takes from us much of the trade which our small growers allow to slip from their own hands. Rabbit-warrens for profit are suggested as an industry upon poor and barren land. The warren has to be surrounded with wire-fencing kept in good repair to prevent the escape of the inmates, and will then, it is calculated, yield a large and rapid return for the small amount of attention afterwards required. The plan is certainly worth trying; indeed, so are the other minor farming industries mentioned in this practical and suggestive little book.

FERTILISERS AND FEEDING-STUFFS ACT, 1893.

—The Board of Agriculture consider it desirable to give publicity to the provisions of the Fertilisers and Feeding-stuffs Act, which came into force on and after January 1, 1894. The provisions of the Act, which applies to wholesale as well as retail sales, may be classified as follows:—(1.) Provisions relating to the warranty to be implied on the sale of a fertiliser or feeding-stuff; (2.) Provisions relating to taking samples and obtaining analyses; and (3.) Provisions relating to offences, penalties, and legal proceedings.

Provisions relating to the Warranty to be implied on the Sale of a Fertiliser, or Feeding-stuff.—Every person who sells a fertiliser (i.e., any article sold as a fertiliser of the soil) which has been manufactured or subjected to any artificial process in the United Kingdom, or imported from abroad, is required to give to the purchaser an invoice stating the name of the fertiliser, and whether it is artificially compounded or not, and what is, at least, the percentage of the nitrogen, phosphates soluble and insoluble (i.e., in water), and potash, if any, contained in the fertiliser, and this invoice is to have effect as a warranty by the seller of the statements contained therein. This provision does not apply to a sale where the whole amount sold at the same time weighs less than half a hundredweight. The fuller details are comprised in a leaflet, to be had, free of charge, from the Secretary of the Board of Agriculture, 4, Whitehall Place, S.W.

LILIUM LONGIFLORUM VAR. HARRISII.

SOMEHOW or other a Japanese variety of Lily found its way to Bermuda, where it speedily made itself so much at home that it now constitutes an important article of trade with the United States and elsewhere. Our illustration (fig. 26, p. 91) shows how well Mr. Wadda, of Cliveden, manages this superb Lily. It is of the greatest value for decorative purposes, or for cutting, and will even bear a slight amount of forcing. We suspect the Lilies represented in our illustration were started in some other house, and transferred later on to the house in which they are shown.

HOME CORRESPONDENCE.

ROYAL GARDENERS' ORPHAN FUND.—The interest of gardeners and all friends of the horticultural fraternity should be stimulated to fresh exertions on behalf of this most useful and economically-managed charity, by the good work that is being done. Orphans who were elected in 1887 and succeeding years are now, after having received the benefits of the Fund until the age of fourteen, being assisted in various ways to make a start in life; and as the number of applications for such help under Rule 13 is likely to increase, I would urge gardeners and others to consider how desirable it is that the Fund should be so strengthened as to allow of every proper case being dealt with satisfactorily. *W. Roupell, Stratham Hill, S.W.*

POTATOS FOR EXHIBITION.—A much-desired point in Potatoes for the exhibition-table is shapeliness and freedom from warts or knobs. This is attained by growing Potatoes for show purposes in prepared soil. Last week I saw some tubers dug in Colonel Halford Thompson's garden at Eastcliffe, Teignmouth, which had been grown in Jadoo-fibre. When the sets were planted, a thin layer of the fibre was placed in the drill under the set, about 2 or 3 inches of Jadoo over and around it, and then it was covered with earth in the usual manner. The varieties thus grown were Boston Q.Q., The Dean, The Gentleman, Winder Castle, London Hero, Veitch's Prize-taker, and Victorious. The heaviest crop lifted was Boston Q.Q., which yielded 5 lb. 2 oz. per plant, or an average of 25 tons per acre; The Gentleman, Prize-taker, and The Dean coming next in point of yield. There was absolutely no disease, and all the tubers came out clean and handsome in shape for their respective kinds. The ground in which the Potatoes were grown is a continuation of a railway embankment, the soil inert and poor, and no manure was used. The net result of the experiment was to show that, as a medium for growing Potatoes

in for the exhibition-table, Jadoo has many advantages over prepared soil which is costly and some in the making. The crop in each heavy, being in the proportion of 22 to 25 acre of marketable tubers. *A. H.*

THE FROST ON JULY 7 AND 8.—I doubt Mr. Kitley's statements respecting reading of the thermometer on the grass on and 8 (see *Gardeners' Chronicle*, p. 74), as in at this place the grass was quite white and morning with hoar-frost; and in one of the gardens only 1½ mile distant, the Scarlet Vegetable Marrows, and Potatoes were cut the ground, and quite blackened by fr numbers of persons have been to see them. I had nothing killed, the gardens at Basing a hill, it was not difficult to remark the ill cold on all kinds of tender plants. *William Basing Park Gardens, Alton, Hants, August*

STRAWBERRY EARLY GIANT.—The above named, being early, and very large, but it is Cockcomb shape, but rather like Sir Joseph and it has very solid flesh, and a fine colour. recently on Mr. Russell of Hatfield, Mytcham borough, and was much pleased with the aspect of the habit and foliage of the plant, which remarkably vigorous and healthy; whilst a bed of Royal Sovereign was suffering from mildew. The Giant will doubtless become giants of the story-books—a killer. It was from Sir J. Paxton and La Grosse Rue Bennett, Farnborough, Hants. [In a circuit by Mr. Russell, we read that fruits of the have been obtained from potted plants 3 oz. each. It is an early variety. Nothing about flavour. *ED.*]

PRIZES BY POINTS.—In a recent report of the Trentham Flower Show, it was mentioned competition in the decorated dinner-table so even, "there was little difference between three." Probably that distinction was covered few points only, yet it is possible that it might have been so diverse in value as £20, £10. The only place, so far as my knowledge where any tangible effort has been made about some equality between the actual exhibit and the prize, is at Carshalton, where August Bank Holiday, the fine local flower always held; and where for several years the liberality of Mr. A. H. Smee, who gives £ purpose in six prizes, a class for nine kinds of flowers, has the prizes awarded on the relative basis. The whole of the collections is pointed on the same scale as that of the County Council. This year there were eight collections entered. The six awarded the points thus: 59 marks, cash 19s. 6d.; 56, 51½, 17s. 2d.; 48½, 16s. 2d.; 46½, 15s. 5d. 12s. 11d. This competition is, all the more the best contested in the show, and the awards create great interest. The pointing shows higher excellence than last year, and was below the points of two years ago. The fiction came from Mr. J. H. Stevens, gr. to E. Esq., of Carshalton, and comprised Cauli Cabbages, Snowdrop Potatoes, Autocrat P White Marrows, Model Turnips, Early Czar Runner Beans, and Excelsior Onions. A sample of Carter's Seedling Pea was in the collections. *A. D.*

PEACH-STONES SPLITTING.—In the "Correspondents," p. 44, July 17, I read that of the above is not known with certainty, it is one of those matters of importance to which should form a subject for investigation research garden. Just so; and I should like to the Editor's remarks that if the real cause preventive could be found apart from out the tree altogether, the person who did and will enlighten the professional gardener be awarded the Victoria Medal of Honour on vacancy occurring. When at Mereworth one tree, a Bellegarde Peach, which every year more or less annoyance in this way, and although precaution was taken, it never improved, had about two dozen of the very best fruit stones. The tree grew freely, made splendid flowers and set plenty of fruit, and with size plenty of them weighed 12 ozs. each largest 14 ozs., and the colour and flavour were alike excellent. It was eventually grafted and replaced with a Nectarine. Another same variety, and which was treated similarly had any split stones except one or two,

usually produced on weak spindly wood, a what common occurrence with most trees. I more than satisfied that it was not from lack of r, severe disbudding, or over-cropping, neither the forcing too hard; but it seemed to be in constitution of the tree, seeing that from the very the evil was present and never was absent. *Markham, Northdown, Margate.*

EARLY-FLOWERING CACTUS-DAHLIA.—For some past it has struck me that a race of Dahlias that old flower somewhat earlier would be most acceptable, and this has been made very evident to me by

true Cactus Dahlias ever seen; and to enable you also to judge on this point, I enclose herewith a bloom of each of the two varieties mentioned above. *John Green, F.R.H.S.* [Very nice blooms of the hybrid Cactus Dahlia. Ed.]

THE DISEASES OF PLANTS.—Would it be possible to obtain from a wide circle of *Gard. Chron.* readers, somewhat on the basis of the Fruit Report, some exact evidence of the prevalence or otherwise of plant pests or diseases? I may be singular in opinion, but I do think that these troubles are far fewer relatively than is usually assumed, and

more efficacious than is attempted cure. But it would all the same be very interesting to learn from reliable sources what are the chief plant diseases or pests in each district, not trifling ones that ordinary culture or treatment can overcome, but enduring ones, such as are of the epidemic order and not easily overcome. Of this class I regard the Potato-fungus; the Hollyhock-fungus, which still holds sway over these garden flowers, is another, and yet we see beautiful double and single Hollyhocks everywhere. Then there is Brassica club, much in evidence in places this year, yet generally regarded as a product of the season more

FIG. 26.—A HOUSEFUL OF LILIUM LONGIFLORUM VAR. HARRISII, IN THE GARDENS OF HON. W. W. ASTOR, CLIVEDEN, LUCKS.
(SEE P. 90.)

many letters I annually receive from my customers living north, who are constantly asking me to such as will flower early, as their season is so rt, the frosts often cutting them off before a bloom been cut. In raising new varieties, I have, there- kept this point in view, and, I am very glad to with great success, as will be proved by the that I was awarded two First-class Certificates two of my new varieties—viz., Indian Prince and en's Victory—at the National Rose Society, held orwich on July 15. I believe this is a record for ertificate to any Dahlia at so early a date. In ing them to bloom thus early, nothing has been as to quality, for the two above were considered ll who saw them as the very best examples of the

were real honest estimates furnished I think it would be found that my opinion is generally borne out. It is no doubt a good thing to manufacture diseases out of small manifestations, and to excite alarms through trifling causes. Just as we live in an age of medicinal quackery, so do we exist in an age of vegetable nostrums; almost everybody having one, and seeking to find money in it. To elevate these nostrums in the esteem of horticulturists has no doubt proved to be a profitable speculation. Yet every practical gardener knows that plant diseases and pests arise more from defective culture and from improper treatment than from other causes. The best cultivators are least affected by these troubles, and prevention is far cheaper and

than of some enduring trouble. There is the Onion-maggot, two years ago working great havoc amongst Onions as also did the Onion-fungus, yet this year Onions never were finer, cleaner, or better everywhere. There is the Paranip and Celery-maggot, so far scarcely seen anywhere in all my travels; and as for Tomato diseases and pests, they are extremely local, usually through very bad culture—and those suffering do not forget to very loudly complain. Peach-blisters is a disease generated by cold, but no one has for it yet found a cure or probably ever will, except by enclosing the trees with glass, and thus excluding the cold air. Phylloxera and Potato-bug are scarce. Vine-mildew is a preventable complaint; so too is shanking. They

never trouble good cultivators; and as to Thrips and red-spider, everybody knows how they are generated and how got rid of. After all, when these thousand-and-one plant diseases are overhauled do they not resemble the famous 300 cats in grandmother's garden that soon were whittled down to three. Have we not made far too much of the vegetable troubles? we have really elevated them from molehills into mountains; and when they come and are fairly faced, do they not soon become ephemeral and ghosts? Of course, some angible troubles remain. Well, what are they beyond those mentioned? It is worth finding out. Do not let us forget, for instance, that caterpillars and blights come, and they disappear, but fruit culture goes on for ever. A. D.

APPLICATION OF MANURE.—There is much injudicious application of manure to plants, especially the finer kinds of artificial manures, many cultivators being extremely anxious to obtain the best results. But by over-dosing their plants, they defeat the object in view, and often do grievous harm. I have seen far more of this kind of over-manning than is pleasant; and I met with a case in point lately, in a gentleman's garden. He is fond of gardening, and was much disheartened by the ruin of his Vines. He has had plenty of well-finished Grapes for many years past; but, having parted with his gardener, and engaged another, he expected great things from him, and the first exhibition of his talents was the destruction of the Vines (such was the conclusion I came to when I learned that he had afforded liberal applications of a first-rate, but very potent manure, to the border). On examining the soil, all the uppermost roots were seen to be dead. Another gardener was put in charge, but no improvement resulted. The remedy I advised this season was to remove the surface-soil down to the living roots, and carefully pack good turfy loam among them, making sure that the old soil and decaying roots were cleared out. If there is no improvement, a new border and Vines will then be the only satisfactory remedy. Most of the large manufacturers of manures send with the orders instructions as to the quantity of the manure which can be safely used. I could fill columns with cases of plants destroyed by manures, but with liquid-manure from the farm-yard, as well as surface-dressings of animal-manure, there is not this danger. M. T., Carron, N.B.

WINTER TOMATOS.—In reference to my note on Tomatos, page 372 of the *Gardeners' Chronicle* for June 5, Messrs. John Sharpe & Son, Bardney, Lincoln, write me that the Tomato seed I received from a neighbour under the name of Sharpe's Plentiful, was correctly named, as the seed in the first instance was obtained from them direct, and is a cross between Sutton's Perfection and Glenhurst Favourite. I can only add, that it is one of the best varieties that I have grown for setting and bringing to maturity a good crop of fruit during the winter and spring. George Woodgate, Rolleston Hall Gardens, Burton-on-Trent.

SOCIETIES.

SCOTTISH HORTICULTURAL ASSOCIATION.

JULY 19.—A meeting was held on the above date at the Society's Rooms, St. Andrew Square. Mr. Todd, the originator of this special meeting, presiding. There was a good attendance of the members, over 60 being present; and a capital muster of Strawberries, some 25 varieties shown, and there would have been a great many more, as the letters from growers in sympathy with the object of the meeting testified, but for the fact that in the south the Strawberry crop was virtually over, and the northern one scarcely ready.

The chief exhibitors were Mr. DUNN, of Dalkeith; Mr. SMITH, Oxenford Castle, Midlothian; Mr. TEMPLE, Carron House, Stirling; Mr. KIRK, Norwood, Alloa; Mr. GORRIE, Mauldrie Castle, Carlisle, Lanarkshire; Mr. MCKENZIE, of the Grove, Trinity; Mr. JAMES GRIEVE of Redbraes Nursery; and Mr. CARMICHAEL, of Pitt Street, Edinburgh. Mr. DUNN and Mr. MCKENZIE were the largest exhibitors; the first showing Alpines, Bothwell Bank, British Queen, Dr. Morère, Garibaldi, Helen Gloede, James Veitch, John Ruskin, President, Scarlet Queen, &c.

The Grove lot had good examples of Royal Sovereign, John Ruskin, Garibaldi, Competitor, Scarlet Queen, Waterloo, British Queen, Ginton Park, Lord Suffield. In the Oxenford lot were fine examples of Duke of Edinburgh, Royal Sovereign, Dr. Hogg, Elton Pine, and Garibaldi, the latter being well done by Mr. SMITH, outside and under glass. Mr. TEMPLE sent perfect examples of President and

Royal Sovereign. Mr. KIRK sent John Ruskin and Royal Sovereign. Mr. GORRIE sent President and Sir Joseph Paxton.

Mr. JAMES GRIEVE of the Redbraes, Bothwell Park, had a very promising new Strawberry, of which he holds the entire stock. It is something in the way of President and W. E. Gladstone. Mr. CARMICHAEL's seedlings being mostly crosses from Waterloo were not sufficiently ripe to show excepting Richard Gilbert, a very promising Strawberry of excellent flavour and firm flesh, in the way of Royal Sovereign. Thomas Carlyle was again shown in trusses of exceeding fertility.

The President after congratulating Mr. DUNN in the name of the Association on his receiving the Jubilee Medal of Honour of the Royal Horticultural Society, called upon him to open the discussion on Strawberries. Mr. DUNN did so in his usual practical manner, and was followed by Mr. JAMES GRIEVE, Mr. TEMPLE, Mr. D. T. FISH, Mr. CARMICHAEL, Mr. MCKENZIE, Methven & Sons, and others. The tables were beautifully decorated by the President; the chief features being a tall, large vase of the old General Jacqueminot Rose with long stalks and fine foliage, sprayed with Maidenhair Fern. Several other vases were furnished with Iceland Poppies, starred with the elegant and graceful Gypsophila, standing well out beyond the Poppies. Messrs. CROLL of Dundee, Messrs. DICKSON of Belfast, Ireland, and Mr. COMFORT, near Edinburgh, staged such exquisite Roses as to make one regret the more that no Scotch Roses were sufficiently advanced to compete with southern flowers at the Palace on July 2nd. Messrs. COCKER of Aberdeen would also have shown, but it was a general holiday on the Monday. Mr. ECKFORD sent some superb stands of select Peas from Wem, Shropshire; two rosy Pinks were specially beautiful, Lady May Currie, and Lady Muriel Hamilton, Blanche Burpee, white, and Queen Victoria, creamy white.

Mr. SCARLET, market gardener, Sevenaks, had a very useful exhibit of some six varieties of early Peas, grown without stakes, and pulled up complete and exhibited on a wall with leaves, flowers, and crop entire. They were all fit for use; Ameer and Duke of York being obviously the best for quality and produce. Time of sowing:—Feb. 6, Early Bountiful; Feb. 11, William Hurst and Chelsea Gem; Feb. 16, Duke of York; Feb. 25, Ameer. Date of showing, July 18. A useful exhibit.

ACTON HORTICULTURAL.

JULY 23.—The thirtieth annual exhibition of this Society was held in the Acton Recreation Grounds (a most suitable spot) on the above date. The show, though a small one, contained many good exhibits. A lamentable feature was the paucity of exhibits in the gardeners' classes. True, many of the places which once had large gardens attached, have been devoured by the rapacious builder, but we hear that a good many local residents who have gardens, declined for some unaccountable reason to allow their gardeners to exhibit at this show. What is really urgently wanted is the immediate amalgamation of the Ealing and Acton Horticultural Societies, a really good annual show might then be secured. There is not room in such a comparatively small district for two societies, one subscription should cover both. As it is, the forces are divided, prejudices and jealousies creep in; weakness, as a natural consequence, follows, and what is of most importance in these utilitarian days, the exchequer inevitably suffers in the matter of the all-important annual subscriptions. The non-competitive element was well represented. Specially worthy of mention were the following: Mr. G. Reynolds, gr. to the Messrs. DE ROTHSCHILD, Gunnersbury Park, sent a prettily-arranged group of Lilies, Orchids and Ferns; whilst a bowl of splendid Water-Lilies was sent by Mr. J. Hudson, gr. to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House; Mr. W. J. Simpson, gr. to C. T. SUTTON, Esq., The Beeches, East Acton, had an effective group of Dipladenias and foliage plants. Messrs. CHARLES LEE & SON, Hammersmith, sent from their Ealing Nurseries, magnificent cut Roses in the leading varieties; and Mr. F. CHANDLER had foliage and flowering plants. Good Grapes came from Mr. SIMPSON; and Tomatos from Frier's Place Nursery.

BECKENHAM HORTICULTURAL.

JULY 28.—A very pretty representative exhibition was held on the above date in the spacious recreation grounds, the subjects were nicely arranged, and the whole carried out with great spirit. In the principal tent groups arranged for effect were a leading feature and Mr. M. Webster, gr. to E. J. PRESTON, Esq., Kelsey Hall, is to be congratulated not only on winning the 1st prize with an arrangement of foliage and flowering plants, which would do credit to any exhibition, but also upon being awarded for the same the Silver-gilt Medal of the Royal Horticultural Society for high culture. All the groups were good, but overcrowding characterised some of them. Among the specimen flowering plants was an unusually fine example of *Plumbago capensis* grandly bloomed; and among foliage plants a large specimen of *Anthurium Warocqueanum*. Some good examples of Ferns were staged, and some small but admirably-grown mosses; Fuchsias finely grown and bloomed; excellent Achimenes, and fairly good Gloxinias for the late period of the year were the leading flowering subjects. Amateurs and cottagers staged good plants also.

Of cut flowers there was a limited display. Mr. WAT TAYLOR, Hampton, had some good Roses; Cactus Dahlias were creditable for the early season; and sprays of *Violas* were very pretty. The amateurs made a brave display with cut flowers.

Fruit was limited in quantity, hardy sorts were the best, one or two early Plums and late Cherries were good; bush fruits predominated. Vegetables were numerous, but little early to see them at their best, unless they are specially cultivated for the season of the year.

One tent was set apart for table and other decorations shown by ladies, and some very pretty designs were staged.

Miscellaneous exhibits were an excellent feature, especially the fine Begonias shown by Messrs. LAINO & SON and J. R. BOX, the former had Roses, and a great lot of bunches of hardy flowers. Mr. H. CANNELL and Mr. ER REID had brilliant Cannas; Mr. FOSTER of Havant, Sweet Peas; Messrs. R. PEED & SONS, one of their charming sweet plants; and there were pretty floral decorations from several local florists. On the whole it was one of the most successful exhibitions that the society has yet held.

CHESTER HORTICULTURAL FÊTE.

JULY 28, 29.—The second horticultural fete in this ancient city was held upon the above dates, on the Roodee or Race-course. This piece of ground is comparatively level, and enclosed by high banks on almost all sides, it forms a very suitable site for such an exhibition, and in the event of the management being continued with sufficient enterprise and discrimination, there would appear to be no reason why the fixture should not become a very important one indeed.

The show just held may be described, upon the whole, as satisfactory. Of course the committee, in their first effort of last year, were fortunate enough to obtain a visit from the Royal Horticultural Society, and this circumstance was sufficiently important to attract more exhibits, more visitors, and general *clat* to the event than could have been expected in the case of a new show. It is not surprising, then, that this season it has been difficult to show an improvement in regard to the number of exhibits or in the extent of the show—and, as a matter of fact, there have been fewer entries than last year; but in other respects there was much improvement noticed. In the place of the very poor tents that were used on the previous occasion, when the space was far too limited to accommodate the exhibits, there were six or seven large and excellent marquees of the best description. Indeed, the committee appear to have gone to the opposite extreme, and have provided space for an exhibition of double the extent. This resulted, as needs it must, in many unfilled stages, and if every exhibit was given room for effectual display, at the same time, the amount of vacant space suggested a meagreness of material. Chester has only to push away on sound lines, and it will obtain success. We were pleased to notice that the Horticultural Show occupied a very much larger proportion to the whole than last year, and we think some of the more objectionable side shows have been curtailed with advantage. There are attractions that may well be associated with a display of flowers, such as music, choir contests, and similar entertainments, and if these form the principal features of the temptation offered to people who do not love horticulture sufficiently well to patronise a show wholly consisting of horticultural products, there will be less cause for complaint. It would be difficult to point to anything in Wednesday's show as being a very preponderating feature, for the schedule was decidedly general in its character, and the exhibits equally varied. In the following report we speak of the principal sections and classes, and will enumerate the chief prize-winners. Beyond this there were many classes for amateurs, and two tents devoted to the produce from cottagers, the details of which, we assume, will be uninteresting to the majority of our readers.

PLANTS (OPEN).

Groups.—The centre of one of the spacious marquees was occupied with groups of plants arranged to produce effect. The principal of these was for a group upon a space of not more than 300 square feet, and the prizes in this class amounted to £55. The 1st prize was awarded to an arrangement from Mr. J. CYPHER, Cheltenham, who had one of his characteristic exhibits, in which the feature of rustic-looking arches or bridges covered with corks was unusually prominent. About 5 feet from the ground, and almost at the back, was one of these, which in shape represented half a diamond, and from this to the corners at the front ran two others considerably lower. By tasteful and skilful disposition of choice foliage and flowering plants, a very attractive picture was made. The whole of the plants showed careful selection, and were suited to the position they adorned, though few of them were of any great size. The 2nd prize exhibit, from Mrs. G. PEASE, Woodside, Darlington (gr. Mr. McIntyre), was quite as remarkable, being from an amateur. It would have been better, however, had some of the plants used been less heavy in appearance. The 3rd exhibit showed lack of experience in arrangement. There were five entries.

The 1st prize in a class for a smaller group of a similar character was won by Mrs. R. S. HUDSON, Bache Hall, Chester.

Twelve Stove and Greenhouse Plants.—The 1st prize was taken by Mr. J. CYPHER, with fine specimen plants of *Livistona chinensis*, *Kentia australis*, *K. Fosteriana*, *K. Belmoreana*, *Ixora Williamsii*, *I. salicifolia*, *Croton mortefontaineensis*, *Statiche profusa*, *Bougainvillea Cyperii*, *Erica Austiniana*, *Phenocoma prolifera* Barnesii, and *Croton*

angustifolia. The plant most deserving of comment in the collection was that of *Ixora salicifolia*, which was a magnificent specimen of one of the most distinct and pretty *Ixora*. The 2nd prize was taken by T. S. TIMMIS, Esq., Cleveley, Allerton, Liverpool, which included a good plant of *Rhododendron Taylori*, one of *Ixora coccinea superba*, and one of *Crotona*; the rest of the plants were commendable. Both of the exhibitors already mentioned were well ahead of Mr. W. VAUGHAN, 4, Somers Place, Leamington.

The class for Six Stove and Greenhouse Plants brought little that needs remark. The 1st prize was taken by W. H. WATTS, Esq., Elm Hall, Liverpool. His very large specimens of *Crotona* Queen Victoria and *Disraeli* might have been better coloured.

Caladiums were fair, but the 1st prize collection of twelve plants from T. S. TIMMIS, Esq., Cleveley, Allerton, is entitled to praise, as several of the plants were very satisfactorily coloured.

Cuscuta found but one exhibitor, which was a great pity, as the Midland people have much to learn yet regarding the beauty and capabilities of the novelties among these plants, which are likely to form important features in future shows. The only collection was one from His Grace the Duke of WESTMINSTER, Eaton Hall (gr., Mr. N. F. Barnes), and the varieties included *Florence Vaughan*, *Alphonse Bouvier*, *Queen Charlotte*, *Jules Chretien*, and *Paul Bruant*. All of these are desirable sorts, and it would have been well had labels been suspended where visitors could have easily noted them, the small wooden ones in the pots being of little use.

Crotons were not numerous in the class reserved for them, but a creditable collection of four plants obtained 1st prize for T. S. TIMMIS, Esq.; and Mr. McIntyre, gr. to Mrs. PEASE, Woodside Gardens, Darlington, was so nearly successful that it was difficult to follow the judges' award.

Ferns were very beautiful, and there were several collections of admirable plants, but that from T. S. TIMMIS, Esq., was decidedly superior, and his plants of *Davallia filix-fer*, *Nephrolepis davallioides furcata*, *N. rufescens triplinatifida*, *Microlepia birta cristata*, and two specimens of *Adiantum cuneatum* left little to be desired. W. H. WATTS, Esq., Elm Hall, Liverpool, is deserving of mention for having staged a very creditable collection, which took 2nd honours.

The best specimen Fern was one of *Adiantum gracillimum*, from Mrs. LOGAN, Upton Lawn, Chester.

The best single specimen greenhouse plant was *Phenocoma prolifera* Barnesii, from Mr. H. CYPHER; and the best specimen stove-plant, *Ixora Fraseri*, from Mr. WM. VAUGHAN, Leamington.

Dracenas call for little comment. The 1st prize for six plants was taken by T. S. TIMMIS, Esq., with moderately good specimens.

Cleus.—Plants were shown in several collections, most of them having been trained as pyramids. Noteworthy specimens about 4 or 5 feet high, excellently trained and of good colour, obtained 1st honours for CHARLES TRELFALL, Esq., Tiltstone Lodge, Tarporley.

Asimenes and *Glorinias* were not so good or numerous as could have been wished.

Six *Crotons*, prizes offered by Messrs. R. Ker & Sons, Liverpool.—This was a well-contested class. The 1st prize was taken by T. S. TIMMIS, Esq., and the 2nd by the Duke of WESTMINSTER.

Table Plants were shown in most praiseworthy manner, the competition being very keen and numerous. The 1st prize for twenty-four plants was won by Sir G. A. MEYRIK, Bart., Bodorgan, Anglesea; and the 2nd by T. S. TIMMIS, Esq. The best collection of six plants, for which Messrs. Sankey & Son, Nottingham, offered a prize, was well won by T. S. TIMMIS, Esq.

CUT FLOWERS.

Roses.—The successful exhibitors of a collection of forty-eight cut blooms, distinct, were Messrs. HARKNESS & SONS, Bedale, Yorks; Messrs. ALEX. DICKSON & SONS, Newtownards, Ireland; and Messrs. D. & W. CROLL, Dundee. The blooms from the 1st prize exhibit of Messrs. Harkness & Sons were capital, and equal in some instances to those common at shows in the London districts three weeks ago. In the varieties shown we noticed none but well-known exhibition sorts, and it would serve no purpose to enumerate them. Messrs. Dicksons' Roses were perhaps a trifle better in colour, but they had not the size and substance notable in the collection from Bedale. There were four competitors in this class.

Messrs. PERKINS & SONS, Coventry, won the class for twenty-four blooms, but the competition was weak, and very poor in this instance.

Excellent quality, however, was present in the class for twelve blooms, and Mr. HUGH DICKSON, Belfast, and Messrs. HARKNESS & SONS were 2nd and 3rd respectively with very fine blooms.

The Tea Roses were beautiful in some instances, but many were marked badly by rain or wind. Messrs. A. DICKSON & SONS beat Messrs. D. & W. CROLL of Dundee, in the class for twenty-four blooms, distinct; and Messrs. HARKNESS & SONS very easily won for a collection of twelve blooms.

Display of Cut Flowers.—This was to be arranged in any design or combination of designs at the discretion of the exhibitor in a space 12 by 5 feet. The 1st prize was £10, and £15 besides was given in three other prizes. There was but one exhibit, and this was of a very unsatisfactory stiff character, quite contrary to one might have been expected.

A brilliant display was made by the class for a collection of *Cuscuta* and *Pioteetes* in variety, arranged with natural

foliage on a space 10 feet by 4 feet. There being upwards of half a dozen exhibits, the number of blooms used was considerable. A variety of stands was used by the different exhibitors, some of them of the advertised ornamental character.

The 1st prize was awarded to MARTIN R. SMITH, Esq., Hayes, Kent (gr., Mr. Blick), and his name is sufficient to indicate that the variety and quality of the flowers used could scarcely have been improved upon. These were shown in glass bottles upon white tissue. The 2nd prize was taken by Mr. W. WATSON, Clontarf Nurseries, co. Dublin; and the 3rd by Messrs. THOMSON & Co., Birmingham.

Flowers arranged in vases or stands were a source of much attraction, considerable taste having been displayed in the arrangements. Messrs. JONES & SONS, Shrewsbury, pleased the judges best, by an arrangement in a small basket upon legs with a high bent handle over-top. Many of the exhibits, in addition to the prize-winners, were beautiful, however, including one composed entirely of pink-flowered Sweet Peas and *Asparagus* foliage.

Messrs. PERKINS & SONS, Coventry, who had much the best ball and bridal bouquets, met with less competition than they frequently encounter.

Carnations were shown as exhibition blooms also, the best collection of twelve blooms being staged by J. W. FROULKES, Esq., Old Northgate House, Chester; Mr. A. R. BROWN of Birmingham, being 2nd. There was considerable competition, and the flowers were fairly good.

Messrs. THOMSON & Co., of Birmingham, won for twelve *Pioteetes*; and MARTIN R. SMITH, Esq., for "twelve *Carnations* and *Pioteetes*, yellow grounds, fancies or self, distinct."

NURSERYMEN'S CLASSES.

Messrs. PERKINS & SONS, Coventry, won a class for cut Roses, the 1st prize for which was £5. There were two other collections, but much more might have been expected from the value of the prizes offered.

A collection of hardy flowers in variety, on a space 15 feet by 4 feet, won 1st prize for Mr. W. F. GUNN, Olton, Birmingham. The variety and quality of the flowers shown, well merited the award gained. Messrs. HARKNESS & SONS took 2nd prize.

A decorative display of cut Dahlias upon a space of 10 feet by 4 feet was best shown by Messrs. JONES & SONS, Shrewsbury, whose display was very satisfactory; Mr. M. CAMPBELL, Blantyre, was 2nd.

FRUIT.

Upon the whole, it was satisfactory. There were several exhibits in the class for a display of ripe fruits, and these were arranged upon tables screened off from the public. The 1st prize was obtained by the Earl of HARRINGTON, Elvaston Castle, Derby (gr., Mr. J. H. Goodacre). In the centre of the table was a mirror, and on this two stands furnished very effectively with cut flowers of *Maderallias*, and a smaller one with *Cattleyas*. The fruit was of excellent quality, and was placed around the central ornament. Of the fruit, we noticed excellent Beauty of Bath Apple, Elton Pine Strawberry, Nobleman Peach, Countess Melon, Pine-apple Nectarine, Muscat of Alexandria Grapes, also Figs, Peaches, Apricots, and Melons. Out of a possible one hundred points, the 1st prize exhibit was awarded seventy, twenty of these being for effective arrangement. The 2nd prize was awarded to Sir J. W. PEASE, Hutton Hall, Guisborough (gr., Mr. J. McIndoe), whose exhibit received sixty-seven points, obtaining six fewer than the preceding one for effect in arrangement. The Earl of CARNARVON, Brethby Park, Burton-on-Trent (gr., Mr. Ready), was 3rd, with fifty-three points.

The best collection of ten dishes of ripe fruit was shown by Lady H. SOMERSET, Easton Gardens, Ledbury (gr., Mr. Harris). It contained Stanwick and Elrige Nectarines, Bigarreau Napoleon Cherries, Stirling Castle and Bellegarde Peaches, two Melons, Black Hamburg and Muscat of Alexandria Grapes, and Brown Turkey Figs. 2nd, Lord BACOT, Blithfield Hall, Rugby (gr., Mr. Bannerman), with a collection including very fine Peaches, Figs, and Grapes. Mr. JNO. EDMUNDS, Bestwood Gardens, Arnold, was 3rd.

The best Pine-apple was a good specimen from Lady H. SOMERSET. The best collection of eight dishes of hardy fruit was also shown by Lady H. SOMERSET, who had Raspberries, Cherries, Red Currants, Apricots, Strawberries, and Morello Cherries. 2nd, Viscount COMBERMERRE, Combermere Abbey, Whitechurch.

Grapes.—The best collection of six bunches was from Mr. W. PRITCHARD, Dee View, Little Neston. The varieties were Muscat of Alexandria, Bowood Muscat, and Black Alicante. The Earl of HARRINGTON was 2nd, but his Muscats were unripe.

The best three bunches of Black Hamburg Grapes were from R. T. RICHARDSON, Esq., and Lady H. SOMERSET had the best Madresfield Court Grapes. There were a few other Grape classes, and Peaches, Nectarines, Cherries, Figs, Tomatoes, and Melons were well shown in numerous instances. Apricots, Apples, and Pears were few.

VEGETABLES.

There were about a score of classes devoted to vegetables, several of these being for collections. Generally, the exhibits were good, and the collections especially good.

The best collection of twelve kinds was shown by Lady THEODORA GUNZ, Inwood House, Henstridge. The Cucumbers, Cauliflowers, Leeks, Potatoes, Onions, Carrots, Beans, Beet, and Tomatoes, were of splendid quality; the 3rd prize was taken by M. S. WILLIAMS, Esq., Aberperry, Glyn, Neath; 3rd, the Earl of CARNARVON, Highclere Castle (gr., Mr. W. Pope).

The best collection of eight kinds was shown by the oil.

Mrs. E. KENYON, Maseham Hall, Whitechurch; and Captain FIELDEN, Mollington Hall, Chester, was 2nd.

The single-dish classes were generally well filled.

NON-COMPETITIVE EXHIBITS.

The firm of Messrs. DICKSONS, Ltd., Chester, filled a whole tent with a very varied collection of plants. There were groups of *Cannas*, *Carnations*, *Hydrangeas*, bouquets, *Ferns*, *Dracenas*, *Cycads*, *Tree Ferns*, *Roses* in great variety, flowers, *Begonias*, *Liliums*, cut flowers of *Roses*, hardy *Fo-Vines*, and many other plants. Vegetables were also shown by the firm, including a collection of 150 distinct varieties of Potatoes. The whole collection was a show in itself, and was deservedly awarded a Gold Medal.

At the entrance to one of the largest tents was one of the very best groups of Malmesdon *Carnations* ever seen in the Midlands. It was from the gardens of his Grace the Duke of WESTMINSTER, and was deservedly awarded a Gold Medal. The group was very extensive, and contained a very large number of rather small plants, which carried from one to upwards of twenty blooms.

Messrs. ECKFORD'S Sweet Peas were beautiful, and represented his newer and best varieties. Messrs. W. & J. BARKENHEAD contributed a splendid collection of *Ferns*, for which they are justly celebrated.

Messrs. WALLACE & Co., Colchester, made an excellent display of Cut *Lilies*, *Calochortus*, *Carnations*, *Montbretias*, &c. Messrs. CALDWELL & SONS, Knutsford, Cheshire, exhibited hardy herbaceous flowers and *Rose* blooms. Mr. H. BROWNELL had a display of *Dahlia* blooms, cut flowers of *Tuberous Begonia*, and a number of cut flowers of summer-flowering *Chrysanthemums* and other plants, also pods and haulm of a good cropping Marrowfat Pea named Rent Payer, haulm about two or two-and-a-half feet high. A grand display of *Roses* in considerable variety was made by Mr. E. MURRAY, Portland Nurseries, Shrewsbury.

Messrs. WEBB & SONS, Stourbridge, had cut flowers of hardy herbaceous plants. Messrs. R. HARTLAND & SON, The Lough Nurseries, Cork, exhibited cut blooms of *tuberous Begonias* in much variety, large, and commendable. A collection of *Tea* and *Noisette* *Roses* in pots was shown by Messrs. J. COWAN & Co., Ltd., Garston, Liverpool. An exquisite exhibit of flowers of summer-blooming *Chrysanthemums*, *Carnations*, *Panicles*, &c., was made by Mr. M. CAMPBELL, nurseryman, High Blantyre. Messrs. PERKINS & SONS, Coventry, had florists' exhibits. Messrs. McHATTIE & Co., Grosvenor Nurseries, Chester, had a few *Conifers*, and a group of miscellaneous plants.

NEWPORT HORTICULTURAL.

JULY 29.—The Second Annual Flower Show of this improving Monmouthshire Society was held on the above date in the King's Hill Field, the exhibits, on the whole, being a decided improvement on last year's show; the weather was everything that could be desired, and the attendance was good, which was very gratifying to the energetic Secretary (Mr. J. G. Ellis) and the Committee.

Mr. J. LOCKYER, gr. to J. C. HANBURY, Esq., J.P., Pontypool Park, was 1st for six distinct kinds of Stove and Greenhouse plants, his *Stephanotis floribunda* and *Ixora Williamsii* being the best. For six distinct Ornamental Foliage plants Mr. J. MADDOX, gr. to Col. WILLIAMS, J.P., Brynllais, Newport, Mon., was 1st. The best six Exotic Ferns came from Mr. J. LOCKYER, and Mr. J. MADDOX had the best group of miscellaneous plants.

Hybrid perpetual Roses, twenty-four distinct varieties, were best from Mr. RALPH CROSSLING, Penarth Nurseries; and Mr. STEPHEN TRESSEDER, Penarth Nurseries, Cardiff, twelve distinct varieties of *Teas*. Both competitors staged some excellent blooms, and Mr. Treseder was awarded a Certificate of Merit for his new Rose, Mrs. Stephen Treseder.

Carnations and *Pioteetes*, each twelve blooms, distinct, were well shown by Mr. WILLIAM TRESSEDER, The Nurseries, Cardiff, who was 1st. These were a clean lot of blooms, and a seedling, Mrs. W. Treseder (fine dark self), was awarded a Certificate of Merit.

Mr. J. LOCKYER was 1st for twelve bunches of cut blooms, distinct, the flowers shown including very fine *Anthurium Scherzerianum*, *Cattleya gigas*, *Gaskelliana*, and *Gloriosa superba*. The best twenty-four varieties of show and fancy Dahlias came from Mr. TRESSEDER, also the best twelve bunches of *Cactus* varieties. Mr. JOHN BASHAM was 1st for twelve bunches of *Pompon* varieties.

Mr. JOHN BASHAM, Fairbank Nurseries, Basaleg, Mon., staged a fine collection of Apple-trees in pots, and miscellaneous plants, and was awarded a Certificate of Merit.

Mr. BIRT, florist, Newport, Mon., made an excellent display of bee appliances, horticultural sundries, plants, &c.

In the Amateur Section, Mr. D. POWELL, gr. to Colonel WALLIS, J.P., Newport, was 1st for four distinct stove and greenhouse plants; and Mr. J. LOCKYER was 1st for a specimen plant, a well-flowered *Clerodendron Balfourianum*. Dr. C. B. GRATTE, Newport, had the best group of miscellaneous plants.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 29.—There was a large number of Orchids on the tables of the Coal Exchange on the above date. It is striking to observe how the interest in this venture is increasing, and now that the Committee has decided to strike and award medals of three classes, bronze, silver, and gold.

noteworthy groups, there will be no lack of subjects brought before it.

WM. THOMPSON, Esq., Walton Orange (gr., Mr. W. Stevens), brought *Odontoglossum Schröderianum* (Award of Merit), with a branching raceme of well-coloured flowers; *Epidendrum vitellinum majus* (Award of Merit); this was of much brilliancy, making the ordinary variety throughout the hall pale in comparison. *Dendrobium longicornis majus*, a splendid plant with five score of whitish blooms on it, but so much nodding as to suggest a plant suffering from lack of water, this obtained a Cultural Certificate; *Odontoglossum Pescatorei*, a very large and perfectly-formed concolored flower, which also obtained a Cultural Certificate.

WM. BOLTON, Esq., Otterspool, submitted a plant of *Oncidium Lanceanum* covered with good flowers (Cultural Certificate), and another one of darker cast of colour (Award of Merit).

Captain SCHOFIELD (gr., Mr. Schill), showed an excellent *Cypripedium Masalanum* (*Rothschildianum* x *supericillare*) (First-Class Certificate). This is a decided novelty, in which the two parents mixture is clearly observable; the segments are of yellowish-green ground, the spotting decided, and of a rich chestnut colour, elongated like the seed parent, with the pouch of the pollen parent; one of the prettiest things ever submitted from a novelty point of view before this Committee.

A. WARBURTON, Esq., Vine House, Haslingden, put up a wonderfully fine example of *Cattleya Hardyana* = *aurea* x *gigas* (First-class Certificate), a very fine variety. Phalax Humboldtii shown by this gentleman is likewise an acquisition (Award of Merit), the density of the spikes and the faintness of the colouring attracting much attention.

THOMAS STATTER, Esq., Stand Hall (Mr. R. Johnson, gr.), had among other fine plants *Cattleya Rex*, with four flowers (Award of Merit). This is a new departure in respect of being neither bluish nor white, but having a lemon shade over its limbs, with a florid dashed lip; also *Laelio-Cattleya Amesiae* (Award of Merit). This is after the way of *Laelio-Cattleya exoniensis*, but with a larger and more ovate lip—an exquisite hybrid between *L. crispata* superba and, we presume, *L. laevis purpurata*.

E. J. SIDENOTHAM, Esq., Eriadene, Bowdon (Mr. Shiner, gr.), carried off the only other First-class Certificate awarded with *Dendrobium speciosissimum*. This is a charming novelty of the negro-hirsute section that beats not only that section but all other white Dendrobies that have come under our notice; the pearly whiteness of the segments, and even of the lip, with the exception of a single undefined lemon blotch on the upper half of this limb, is conspicuous; and then the substance is like ivory to the touch. This is an excellent gain in species, and should be in every collection. He also exhibited *Cattleya speciosissima* (First-class Certificate). This plant was in grand health, but the flowers were better last season.

S. GRATRIX, Whalley Range (gr., Mr. D. McLeod), put up one of the prettiest forms of a pale flushed *Cattleya Gaskelliana* called 'Fairy Queen' (Award of Merit). The flowers were a little tarnished, but there was no mistaking the variety with the beautiful cerise spot placed right in the centre of the lip. He also exhibited *Cypripedium* x *Monica* = *Roebelini* x *barbatum* Warneri; the colouring disc and the form were notable, the fine arching petals showing the undulating outline of Warner's *barbatum*; an excellent seed parent.

EDWARD S. CLARK, Esq., Wrexham (gr., Mr. J. Edwards), had a Cultural Certificate for *Oncidium Lanceanum*; he had also a fine flowered white with orange blotch on the lip of *Dendrobium Bensonii*, full of flowers, and also a good form of *Laelio-Cattleya Arnoldiana*.

W. A. GENT, Esq., Brooklands, had a Cultural Certificate for a piece of *Cypripedium Parishi*. H. GREENWOOD, Esq., had a good piece of *Cypripedium urantherum superbum* (Award of Merit); and the same award was given to a splendid large form of *Dendrobium Phalaenopsis Schilleriana*.

WM. POLTON, Esq., Widderspool, had Award of Merit for a pretty variety of *Cattleya Schilleriana*, also for a fine piece of the white lipped with straw coloured segments of *Sobralia leucorhiza* shown by JOHN LEMAN, Esq., Ashton-on-Mersey.

A Silver Medal was awarded to E. SHORLAND BALD, Esq. (Mr. A. Hay, gr.), Vice-President, for a select and showy lot of about two dozen plants, comprising *Dendrobium Phalaenopsis Schillerianum* (Award of Merit), a fine *Cypripedium Curtisii*, a fine stiff crowned *Dendrobium Dearei*—specimen of the best, a fine *Masdevallia Veitchii*, &c.

WM. COWAN, Esq., Otterspool, was also awarded a Silver Medal for a large group. The *Cattleya Schilleriana* were valued in tints, and all of them were well cultivated. *Cattleya Harrisoni*, a nice flower, the pretty *Dendrobium Johnsonianum*, an albino; *Cattleyas* in variety, comprising *Supra Aurea* and *Warszewiczii*, and some of the better class of cut flowers.

SOUTHAMPTON HORTICULTURAL.

JULY 31 & AUGUST 2.—The summer show was held on the Common, by kind permission of the Town Council.

Plants were the chief feature. For eight store and greenhouse specimens, half of which were to be in flower, there were two competitors—Mr. F. WILLS, nurseryman, Shirley, Southampton; and Mr. W. PEEL, gr. to Miss Todd, Siltborough Lodge, Shirley. So close were the two collections in point of merit that they were awarded prizes of equal value.

Mr. WILLS had the best specimen plants in flower, viz., *Allamanda grandiflora* and *Bougainvillea glabra*, while he was beaten by Mr. PEEL in foliage plants, his *Cycas circinalis* being a very fine one.

In the class for six specimens there was keen competition, and Mr. T. OSMAN, gr. to Mrs. HAALFROOT, Bittern, took the 1st prize; Mr. AMY, gr. to the Hon. Mrs. ELLIOTT YORK, Hamble Cliffe, being a good 2nd.

Groups of miscellaneous plants arranged for effect were bright and effective, but nothing new in arrangement or the use of material was observed. Two classes were provided, one for 150 square feet, and a smaller area.

Prizes were offered for Ferns, Pelargoniums, Fuchsias, Begonias single specimen foliage, and flowering plants, and in all these competitions there was spirited rivalry, and the plants were of a very creditable character.

FRUIT was plentiful, and of good quality. Mr. INGLESFIELD, gr. to Sir J. KELK, Bart., Tedworth, Marlborough, was 1st for six kinds; and Mr. HENBEST, gr. to A. KENNARD, Esq., Orasley, Winchester, was 2nd.

Grapes made a good show, and the best three bunches of Black Hamburg were those of Mr. MITCHELL, gr. to J. WILLIS FLAMING, Esq., Chilworth, the bunches averaging 4 lb. each, and with such he easily took the 1st prize; Mr. G. NEWMAN, gr. to Captain GANSEN, Twyford Lodge, Winchester, being a very worthy 2nd.

Mr. MITCHELL was 1st for three bunches of any variety, with fine examples of Madrasfield Court; and Mr. W. CHEATOR, gr. to Sir W. PINK, Shrover Hall, Coatham, was 2nd, with finished bunches of the same variety.

Muscat of Alexandria, for which there was a special class, was well shown by Mr. INGLESFIELD, and any other white Grape by Mr. G. Hall, gr. to Lady ASHBURTON, Melchet Court, who showed fine Foster's Seedling; Mr. CHEATOR, with Buckland Sweetwater, coming next.

Peaches, Nectarines, Melons, and bush-fruit were of good size, and excellent in quality.

VEGETABLES were in abundance, Mr. T. WILKINS, gr. to Lady THEODORE GUMER, Inwood House, Blandford, taking the chief prize.

ST. NEOTS HORTICULTURAL.

AUGUST 2.—One of the best exhibitions this Society has held took place on the above date in the grounds of Priory Park, the residence of E. Fyfe Rowley, Esq. The day was gloriously fine, and the attendance large.

Specimen plants were much better than in previous years. Mr. G. REDMAN, gr. to Miss GOODPAIN, Eynesford, taking 1st prize with six, the leading ones being *Bougainvillea glabra*, *Clerodendrum Balfourianum*, and *Allamanda grandiflora*. The best specimen flowering plant was a fine *Anthurium Scherzerianum* with about 50 spathes, from Mr. T. LOCKIE, gr. to A. J. THORNTON, Esq., Diddington Hall. Mr. REDMAN came 2nd with an excellent piece of *Statice profusa*. The best specimen foliaged plant was a fine piece of *Dracaena Lindenii* from Mr. T. LOCKIE; Mr. REDMAN taking the 2nd prize with *Croton Welshmanii*.

The best group arranged for effect was set up by Mr. REDMAN; it was composed of bright foliaged plants such as *Caladium*, *Crotons*, &c., with a few choice flowering plants. Conspicuous was a good specimen of *Stanhopea grandiflora*, freely bloomed; the 2nd prize went to Mr. FITCHLEY, gr. to A. W. ATKINSON, Esq. Finely grown and flowered pyramidal *Fuchsias* were shown by Messrs. LOCKIE and REDMAN, the prizes being awarded in the order of their names; they were a great improvement upon anything we have seen at St. Neots for some years past. Some excellent zonal *Pelargoniums* finely grown and bloomed came from Mr. T. LOCKIE, Mr. REDMAN, taking the 2nd place. Tuberous-rooted *Begonias* were also a good feature. The best four Ferns came from Mr. REDMAN, and included a fine specimen of the Staghorn type; Mr. W. LEST, gr. to J. DAY, Esq., was a close 2nd. Some very good variegated *Pelargoniums* came from two exhibitors.

Fruit was somewhat sparingly represented; the best eight dishes was set up by Mr. R. Clarke, gr. to Capt. W. H. O. DUNCOMBE; he had white Muscat Grapes, Peaches, Nectarines, Apricots, Melons, &c. Mr. T. Stone, gr. to R. A. COCHRANE, Esq., was 2nd. Peaches, Nectarines, Apricots, Plums, Apples, Pears, &c., were also shown as single dishes.

Vegetables.—Some remarkably good vegetables were staged, and the prizes offered by Mr. C. BEASON for nine varieties brought a very fine collection from Mr. T. LOCKIE. Mr. MYERS, gr. to the Earl of SANDWICH, Hinchbrook, was a good 2nd. Mr. LOCKIE took the 1st prize with a perfect brace of his Royal Windsor Cucumber. Mr. MYERS had the best collection of six dishes of Potatoes, and very excellent samples they were; Mr. T. BIGGS of St. Ives was 2nd. The many other classes for Vegetables contained very good exhibits indeed.

Miscellaneous.—A very fine group of Crozy's new dwarf Cannas was shown by Messrs. WOOD & INGRAM, Huntingdon, which was highly commended; and they also had bunches of some of Mr. Martin R. Smith's and other new Carnations.

FLOWER SHOW AT THE ABBEY PARK, LEICESTER.

AUGUST 3, 4. This was the Society's Twelfth Annual Flower Show, and it can be truly said that it grows in importance as the years pass. Several large tents were

required to take the exhibits, and they were generously filled, despite the fact that some intending exhibitors that they could not exhibit. The Mayor and I attended soon after noon and declared the show and during the day there was a great throng of visitors. Miscellaneous exhibits, as usual, contributed greatly to the beauty of the show.

PLANTS.

Never a strong point at Leicester, were shown in collections of six specimens each; and that of Mr. BLAIR, gr. to P. H. MURTY, Esq., was 1st, two well-coloured *Bougainvilleas* *Sanderiana*, *Allamanda*, *Williami*, &c.; best; Mr. C. J. MAX, Floral Depot, Nottingham, was 2nd. Mr. MAX had also the best 6 specimens of *Exotic* Ferns he was the only exhibitor.

Tuberous-rooted *Begonias*, double and single, were fairly good. There were some good bushes of some *Fuchsias* of fair size; and very good zonal *Pelarg.* from Mr. H. ROGERS, Florist, Belgrave, Leicester; J. PERKINS, of the same address, being 2nd. The finely grown and bloomed.

The groups arranged for effect were superb, so space of 150 superficial feet, and they were arranged the centre of a large tent, and could be therefore seen from two sides. Mr. C. J. MAX had an elaborate and 1 arrangement, the central plant being a fine *Kentia* *F.* ana, round about which were showy *Crotons* and foliage plants; the flowering plants, consisting of, others, *Campanula isophylla* alba, doing lowly but service. The groups were of a character which now much favour in the Midlands—i.e., they were square in and each plant is so placed that it is seen from all sides. H. ROGERS, Gipsy Lane, Leicester, was 2nd, also a elaborate group similarly arranged to the preceding brilliancy of some of the *Crotons* he employed was striking.

CUT FLOWERS (OPEN).

These are always a leading feature at Leicester, and Rose classes the northern growers carried the away best 36 blooms came from Messrs. HARKNESS & SON, 1 bright red Roses predominating. Messrs. DICKSON & NEWTON, Belfast, was 2nd, and Messrs. D. & W. DUNDEE, 3rd.

Messrs. COCKEN had the best 12 Teas and Noisettes stand containing some beautiful blooms; and the towards firm was 2nd. The best 12 of any one variety A. K. WILLIAMS, from Messrs. D. & W. CHOLL, closely; Her Majesty, from Messrs. COCKEN.

The best 12 Teas of any one variety were Maman C from Messrs. HARKNESS & SON; Messrs. D. & W. CHOLL were with Madame Cusin.

The best Rose in the show was a superb bloom of Majesty, shown by Messrs. DICKSON & SON, in their 36

Amateurs Division.—Here the leading prize-winner was Rev. J. H. PENNERTON, Havering-atte-Bow, who had very good blooms for a grower so far South. Teas better shown by amateurs and gardeners than the varieties.

Car.ations are always a good feature at Leicester, the 12 blooms bizzards and flakes came from Messrs. TUCKER, of Birmingham; Mr. R. MAKEPEACE, of Leicester, good local grower, being 2nd.

Messrs. THOMSON & CO., had the best 12 Picotees; M. G. OWEN, Kings Heath, was 2nd. Messrs. THOMSON also had the best 12 fancies or yellows; Mr. MAX again 2nd.

Hardy Perennials.—Another fine feature in the cut classes was that for twelve bunches of hardy perennials. Messrs. COCKEN & SON were placed 1st, having had striking examples; chief among them were early flow *Gladioli*, *Alstromerias*, *Scabiosa caucasica*, *Lilium* *H.* *Chrysanthemum maximum* Mr. Head (a very fine form) 2nd, Messrs. HARKNESS & SON, who had *Tigrida* *pau* very striking feature), the scarlet *Chelone barbata*, some hybrid *Gladioli* *Hollanthus*, *Phloxes*, &c.; 3rd, Mr. I. GUNN, Nottingham.

The hardy annuals, shown in bunches of twelve, were attractive also. The best came from Mr. GUNN; chief among them were such fine annual *Lupinus* as *Martwegii* and *C. shankal*, *Eschscholzia*, *Rose*, *Cardinal* and *Mandarin* (very fine), *Larkspur*, *Sweetpeas*, *Yellow Sweet Sultan* Mr. G. GARRAWAY, of Bath, was 2nd with smaller but representative of very useful varieties.

Bunches of Store and Greenhouse Cut Flowers were attractive also. Mr. W. J. EMPSON, gr. to Mrs. WILSON, Amptill House, Beds, was 1st, having had bunches of a brilliant *Nerine*, *Eucharis*, *Amazonia*, *Allan* *Bougainvillea*, some choice *Orchids*. Mr. C. J. MAX was

Fancy *Pansies* were shown in two classes, the best of which were very good for the season, came from J. L. I. Esq., Humberstone, and he was also 1st with twelve bunches of *Violas* arranged in sprays.

FRUIT AND VEGETABLES.

These exhibits were extensively and finely shown. Leading class was for 8 dishes, the 1st prize going to Edmonds, gr. to the Duke of St. ALBANS, Beaulieu, A. Notts, who had a very fine Queen Pine, which, with M. field Court and Muscat of Alexandria Grapes, Royal G Peaches, and Lord Napier Nectarines, formed leading dishes; Mr. J. H. GOODCARE, gr. to the E. HARRINGTON, Elvaston, Derby, was 2nd, with finely cut Muscat Hamburg and Muscat of Alexandria Grapes, garde Peaches, Pine Apple Nectarines, &c.

There were several collections of four dishes, Mr. A. Chandler, gr. to Mr. JAMES, Acton House, Rugby, took the 1st prize with excellent Muscat of Alexandria Grapes, Buntington Peaches, Pine Apple Nectarines, and others. Mr. Goodacre came in a close 2nd.

There was a class for four bunches of Grapes, Mr. McCullish, gr. to W. T. Wren, Esq., Newstead Abbey, was placed 1st, with very good examples of Madresfield Court, Gros Maroc, and Muscat Hamburgh, and Muscat of Alexandria; Mr. Goodacre was 2nd, having Foster's Seedling, Muscat of Alexandria, Gros Maroc, and Black Hamburgh.

Mr. A. Hampshire, gr. to Mrs. W. P. HARRISON, Beau Manor, Loughborough, staged a very good Charlotte Rothschild Pine which gained the 1st prize; Mr. READ, The Gardens, Bretby Park, coming 2nd with a Small Queen.

The best two bunches of Black Hamburgh Grapes came from Mr. McVINTISH, The Gardens, Lookington Hall; Mr. Goodacre was placed 2nd.

With two bunches of White Muscat of Alexandria, Mr. McVINTISH was also 1st; and Mr. R. SHAW, The Gardens, Garrendon Park, was 2nd.

Any other Black was represented by two fine bunches of Madresfield Court from Mr. F. H. BRAINE, gr. to R. DARTS, Esq., Melton Mowbray; and Mr. READ was 2nd with the same.

The best two bunches of any other white Muscat but that of Alexandria, was Cannon Hall from Mr. A. J. ELPHINSTONE, gr. to E. PARRIS, Esq., Sherwood; 2nd, Mr. READ with Foster's Seedling.

Other fruits consisted of Peaches and Nectarines, both well shown, Melons, Cherries, Figs, Gooseberries, &c., and in the class for Tomatoes, some very fine fruit were staged.

The special prizes for Vegetables offered by Messrs. BUTTOS & SONS, Reading; HARRISON & SONS, Leicester; C. WARNER, of Leicester, and others, brought a very fine display, as did also the liberal prizes for twelve distinct varieties offered by the Society. But the tent filled so quickly, and seemed to be such a prominent object of interest, that any attempt to get near the leading collections was practically impossible, so that no details can be set down.

Miscellaneous Exhibits greatly added to the variety of the Exhibition. Messrs. JOHN LAING & SONS, Forest Hill, sent from the Stanstead Nurseries a magnificent group of Caladiums arranged with foliaged plants which included such fine varieties as Alexander III., Gartner-directeur Geraud Roi de Janeiro, Excellent, La Duchesse, Mrs. Harry Veltch, Compeva, La main rouge, Rose Laing, Golden Queen, &c.

Messrs. DOBBIE & CO., Bothessay and Orpington, had a very large and varied collection of cut flowers: Violas, Dahlias, Pelargoniums, Pansies, Sweet Peas, &c., which was an object of interest to the visitors; Mr. JOHN FORBES, Florist, Hawick, had hardy flowers, and a large number of blooms representing all the types of the Carnation. Mr. B. R. DAVIS, Nurseryman, Yeovil, had a superb collection of Begonias, plants, and cut flowers; Messrs. W. CLIBBON & SONS, Oldfield Nurseries, Altrincham, had bunches of hardy flowers: Carnations, Pinks, Sweet Peas, Violas, Begonias, &c. Mr. E. ECKFORD, seed grower, Wem, had a collection of fifty bunches of Sweet Peas, including the fine new varieties Sadie Burpee (a fine pure white), Lady Grisell Hamilton, Colonel, Lady Mary Currie, and Prince of Wales, all set up in his usual excellent style. Messrs. W. & J. BROWN, nurserymen, Stamford, had a large and varied collection of small coniferous plants in pots, quite a unique exhibit. Mr. GOODACRE brought from Elvaston Castle Gardens a large group of Malmison Carnations, finely bloomed. Messrs. R. EDWARDS & SON, Sherwood, had a table of small Ferns in great variety; and there were also some tables of floral decorations of varied characters.

NURSERY NOTES.

ZONALS, ETC., AT THE HOME OF FLOWERS, SWANLEY.

A BEAUTIFUL show of these plants in almost every known variety is to be found at the present time at this nursery. The plants were struck in the autumn of last year, and possessed from four to six main shoots; and as the old wood increases in amount they will continue to flower, after being top-dressed in some cases, and repotted in others. The plants carry large heads of closely-set flowers of generally good substance and regular outline. An orange-scarlet coloured variety of superlative merit is Eleanor, a fine truss and flower; A. F. Wotton is salmony-red, and Camiope is another of this shade of colour; Phillis is a rosy-scarlet, with very large pip and truss; Lord Aberdeen is a beautiful scarlet coloured variety of great beauty; Madame Bruant has rosy-red suffusion on a white ground, deeper at the edges—a closely-set truss; Valkyrie has a light-red centre, running off to a flesh-tint at the margin—a very pretty flower; Snowdrop is a fine white flower, of good substance and truss; Delicate is a rosy-lilac, a pretty tint, the truss of moderate dimensions, desirable for its colour; Blue Beard is purplish-crimson, of a rich shade, and

Pink Domino has blooms of a rich pink colour, and a very fine truss; Golden Horn is an orange-scarlet, and is the nearest approach to a yellow colour that the cross-breeders have as yet obtained; Belle Alliance is a white flower with minute rosy-crimson spotting round about the central portion of the bloom; Iris is an immense truss of a rosy-crimson colour, a striking flower; Duchess of Marlborough is a flesh-coloured bloom, deeper in tint towards the centre; M. Calvat is of a deep scarlet colour, a very fine truss and bloom, which latter has a white eye; Dr. MacDonald is a bloom of deep scarlet tint, without any eye, a very fine thing; Gloire Lyonnaise is one of the largest trussed zonals, a brilliant scarlet; Kitty is similar to the last, but possesses an eye; the truss is very large, as are also the individual pips.

A span-roofed house was filled with double-flowered Zonals, which we made notes of: Madame Charlotte, a rosy-pink, one of the best of this tint; double H. Jacoby, identical in colour with the single-flowered old favourite; Jeanne d'Arc, like Belle Alliance, but spotted, a neat close truss; Rosa Bonheur, a rosy-pink truss of large size; Lady Candahar is the best of those of an orange-scarlet hue, neat in truss, and the pipe of fair size; Le Donon is white with a violet tinge, a very double flower, and the truss is of good size; Duc de Mortmart has purplish-crimson flowers and a fine large truss; M. Alphonse Ricard is an orange-scarlet, fine and good, but what would be called semi-double; Joyful is pink, with flesh-coloured margin, a close and good truss; Beauté Poitvin, with semi-double flowers of a salmony-red—very nice; Le Comteable is of a deep pink colour, a neat flower, and very closely-set truss; Raspail Improved is one of the best of the scarlet varieties.

We remarked many of the foregoing doing well in the open ground, in spite of lack of water and the great heat. Ivy-leaved Pelargoniums were making a fine display alongside of these, especially noticeable being the variety Cuvier, a flower of a rich purple colour, and as seen, very dwarf. Streptocarpus and Begonias were very fine, and in enormous numbers, and a new variety of Cockcomb, with margins of white and gold.

LAW NOTES.

THE AGRICULTURAL RATING ACT AND MARKET GARDENERS.

SMITH v. RICHMOND & PIPER.—This was an appeal by way of special case from the decision of certain justices of Worthling, and raised an important point under the Agricultural Rating Act of last year.

The Attorney-General, in support of the appeal, said the case raised the important point whether greenhouses or hothouses were buildings within the meaning of the Agricultural Rating Act, 1896, which provided that the occupiers of agricultural land should be relieved of half the rates payable in respect of such land.

The respondent Piper was a market-gardener and nurseryman, and claimed that his ground, being a "market-garden," was entitled to the relief granted by the Act, notwithstanding the fact that certain greenhouses and hot-houses had been erected on the land for the purpose of growing Grapes, Cucumbers, Tomatoes, &c.

The Assessment Committee held that the glass-houses were "buildings" within the meaning of the Act, and therefore not entitled to relief. The justices, however, held that the land in question was a market-garden, and entitled to relief. The Attorney-General submitted that the Act granted relief to agricultural land only, and not to buildings, even though they were used for agricultural purposes, and that therefore the decision of the justices was wrong.

Mr. Justice COLLINS, in giving judgment, regretted to say that he differed from the views of his learned brother (Mr. Justice Ridley). The question was whether the hereditament, which was the subject-matter of this discussion, was or was not a market-garden. In his opinion, the glass-houses on the property were necessarily part of the market-

garden, and the land was not the less used as a market-garden because the glass-houses were erected upon it. When the section of the Act dealt with buildings, in his opinion it dealt with something distinct from agricultural land, and therefore, if he once came to the conclusion that the hereditament was agricultural land, he was not in the least pressed by the provision as to buildings. It seemed to him that any other view would really defeat the purposes of the Act. When the Legislature thought fit to include market-gardens in the exemption made in favour of agricultural land, they must have known that market-gardens under ordinary conditions were largely covered with glass, and they could not have intended to give these gardens a boon with one hand and take it away where the gardens were so covered with glass. To hold that they had done so would in his view defeat the main purpose of the legislation. He was of opinion that the buildings in question were part of the market-garden, and as such the hereditament was entitled to the exemption given by the Act to market-gardens.

Mr. JUSTICE RIDLEY said it was with great hesitation that he differed from his learned brother, but he had not been able to construe the Act in the same way. It appeared to him that the whole scope of the Act was to relieve what was called and defined as agricultural land. The intention of the Legislature was that arable, meadow, or pasture-ground, cottage-gardens of certain dimensions, market-gardens, nurseries, grounds, and so forth, were to be included as agricultural land, and that the occupiers should pay half the rates. The object was to contrast land entitled to relief with the buildings which were not so entitled, and there was no suggestion in the Act that buildings were entitled to relief. The dividing-line seemed to him to be between land and the buildings, and if they once found a building in existence on the land it must be treated as such. He withdrew his judgment, and the appeal would be dismissed.—Leave to appeal was granted. *Daily News.*

GARDENERS' "RIGHTS."—JUDICIAL CRITICISM.

In the City of London Court, on Wednesday, Mr. Commissioner Kerr made some observations of importance to gardeners in their relations with their employers. The plaintiff, Abraham, a gardener sought to recover from the defendant, Mr. Henry R. Smith, the sum of £7 9s. 2d. for a month's wages in lieu of notice, and for travelling expenses.

Mr. LEONARD WELLS, who appeared for the plaintiff, said that the case was a little out of the common. The plaintiff was a gardener, and on May 15 he was managing a florist's business at New Barnet, when he saw an advertisement in one of the gardening papers in which the defendant advertised for a gardener. The plaintiff applied for the post, and, in reply to a letter from the defendant, he called. The defendant was satisfied with the plaintiff's references, and said he would suit him very well. Before being engaged, the plaintiff said he thought he would like to see the defendant's place at Horley. It was arranged that he should go down there, which he did. The plaintiff then being satisfied he was engaged as the defendant's gardener at wages of 30s. per week, that including an apprentice whom the plaintiff had. It was also agreed that the plaintiff should have a cottage to live in, and milk and vegetables were to be supplied to him. The defendant promised to pay the plaintiff's expenses of removing from Barnet to Horley, which the plaintiff told the defendant would come to about £7. The man who was in the defendant's service was dismissed so that he should leave on June 26, and the plaintiff was to have gone in on the 28th. Everything was settled, but the defendant changed his mind, and declined to take the plaintiff, sending him 7s. 6d. for his expenses in going to Horley and to the City. The plaintiff's rights were not to be treated in that manner, and he had brought his action.

The plaintiff was called, and he bore out the statement of his advocate.

Mr. Commissioner KERR said that assuming there was an engagement he could not see what damage the plaintiff had sustained. The plaintiff said he had been out of work since June. Mr.

Commissioner KERR pointed out that that was not necessarily in consequence of defendant's breach of contract. The plaintiff said it was agreed between them that he was to have a month's notice when leaving the service, and as he was engaged he asked now that at any rate should be paid him. He also claimed that he was entitled to be paid a day's pay and railway fare when he went to see the defendant before there was anything like an engagement. That was, he contended, the custom which prevailed amongst gardeners. He had a right to it, and he thought the Court should award it him. He denied that he agreed to take the situation as a weekly servant.

Mr. Commissioner KERR said that gardeners could not charge their time when they were looking for a situation. There was no obligation upon a master who intended to engage a gardener to pay his expenses, unless he promised to do so. It was sometimes done, but there was nothing to make a master liable for it. The plaintiff said he had never known a master to refuse to pay not only the expenses, but a day's pay as well. Mr. Commissioner Kerr said that was preposterous.

The DEFENDANT, in his evidence, said that he never engaged the plaintiff. It was absolutely untrue that he ever took him into his service. The matter was discussed, and the plaintiff asked him if he would pay for his furniture being removed from Barnet to Horley. When the plaintiff told him it might come to £8 or £10, he said he would consider the matter. He demurred to paying the removal expenses, and he asked what would happen if the plaintiff left his service—say in a week. To that the plaintiff told him that it would be his (defendant's) loss. Then he decided not to take the plaintiff, and he sent him 7s. 6d. to pay for going down to Horley. As for the other expenses it was ridiculous to suggest that he was liable for them.

Mr. Commissioner KERR said he was not satisfied that there was any engagement. There would be judgment for the defendant, and he would be allowed his costs.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.		BRIGHT SUN.

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

NOTICES TO CORRESPONDENTS.

ASPIDISTRA: K. & B. The spots on the leaves are caused by a fungus, *Ascochyta Aspidistræ*. Remove all affected leaves and burn them. Dress the plants with the Bordeaux Mixture.

CARNATIONS SPOURING: C. Y. sends flowers of three very distinct colour and marking, all from one plant. It shows what, indeed, needs no proof, that all the varieties of Carnations sprung from one common ancestor.

CORRECTION. Report of Royal Horticultural Society's Meeting, July 27. *Fe Begonias*, for *B. Hartland & Son, &c.*, read *R. Hartland & Son, the Lough Nurseries, Cork*.

CUCUMBER HOUSES: J. Market. A suitable kind of house for winter and spring forcing is the one with hipped roof, the longer slope facing south, the width 12 feet, passage in middle, brick pits 4 feet deep on either hand, these being furnished with hot-water pipes for bottom-heat. Four rows of 4½-inch pipes are required for top-heat, and these should not be buried in a channel in the floor, but be exposed but, still not brought in the vicinity of the bins. A water-tank should be placed at the end of one of the beds capable of holding 50 to 60 gals. of water, and if the rain falling on the roof can be conducted into this tank, it will be an advantage. The outer walls of the pit should not be less than 9 inch brickwork, or more if stone be used, the inner walls being 4½, with oaken sills to the beds. The roof should be fixed as regards the long slope, the back slope consisting of hinged lights; top ventilation should be obtained by means of short movable lights worked with chain or lever, and front ventilation may be dispensed with. See that the heating apparatus is fitted with a cut-off valve, where that portion of it which heats the beds enters the chambers beneath them. One or two openings 1 foot by 2 feet should be made in the wall of each bed, these being fitted with iron or wooden doors. For makers, consult our advertisement columns. Houses for summer cultivation should be span-roofed, and run north and south. It is a saving of fuel to build forcing-pits of this kind partly underground.

CUCUMBERS: J. H. No fungus, but something wrong with the cultivation, about which you tell us nothing, and therefore we are unable to help you.

EMPLOYMENT AT KEW: Kew. Applications for employment are entertained as vacancies occur, and the would-be pupil must forward his application to the Director, W. T. Thiselton Dyer, C.M.G.

GRAPES SPLITTING: Vines, R. H. W. For methods of treatment, see Calendarial article in *Gardeners' Chronicle*, "Fruits under Glass," p. 50, July 24 last.

MELONS: H. McCallum. There is no fungus disease in your leaves, but their appearance is due to some local cause. We have seen the same thing before, which was remedied by altered conditions. There is some mistake in the culture.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—B. G. Cassia corymbosa.—M. Cuthbertson. Astilbe Thunbergii, Helenium grandiflorum, Sidalcea oregana, Centaurea nigra.—J. R. Spirea Lindleyana, Bilbergia, but of which species we cannot determine until we see flowers.—R. H. W. Adiantum decorum, Ivy-leaf Pelargonium l'Elegante.—H. Stanley. 1, Hedy-chium Gardnerianum; 2, Dendrobium crystallinum; 3, Maranta Massangana; 4, Fittonia argyroneura; 5, Francoa ramosa; 6, Stanhopea Bucephalus.—A. M. Poa rigida.—A. H. Dendrobium bicameratum, Epidendrum volutum. The Fern is Pellea (Platyloma) flexuosa; the variety of Odontoglossum crispum is very good.—R. M. Rhodotyus Kerrioides.—Daphne. The Palm misses the growing temperature of the house from which it was removed for sale, and possibly got some check at the roots during removal.—E. J. The bulbs in the clump were possibly mixed. Those of which you send specimens, represent the so-called double form, which has been in cultivation in this country for 300 years.—J. M. B. The Dendrobium has probably been in a very low temperature, at some time during its growth; possibly at night, and during the time it has been very moist. Sometimes the sun's rays will cause a similar injury.

POTASH: F. S. The application of potash to the Strawberry-beds may consist of commercial potash, or it may be afforded in the form of wood-ashes

made from young twigs and shoots. The manure would supply the necessary nitrogen you have it not, it could be afforded as nitrate of soda. We would advise you to read the article the "Chemistry of the Strawberry," which appeared on pp. 490 and 591 of vol. xx. of *Gardeners' Chronicle* for 1896.

POTATOS: A. C. Wills. It is not at all unusual for Potatoes to produce tubers in the axils of the leaves. It is often caused by some injury to the tubers by a thrust from a fork—or other cause.

SULPHIDE OF POTASSIUM AND BORDEAUX MIXTURE. The first is known commonly as *li sulphur*, and is sold by most chemists. The second may be made at home, using the following formula—Copper sulphate, 4 lb.; fresh unslaked lime, water, 40 gal. Place 6 gal. of water in a wooden tub, and hang in it 4 lb. of pulverized copper sulphate in coarse sacking. Slake the lime by adding water only as fast as it takes it up, and add together. Before using dilute to 40 gal. The lime should be added to neutralise the free sulphuric acid. To test this, get a pennyworth of yellow prussiate of potash from the chemist, and place in a bottle of water. Add a few drops of this to the Bordeaux Mixture before it is diluted, and turns the mixture brown, the lime is deficient more must be added.

THUYA LOBBE DYING: A. C. R. We do not infer from the appearances presented, that the mould on the roots caused the death of the plant. The causes suggested by you, we think the use of a weed-killer is the most likely. Send a portion of the foliage.

TILLANDSIA AND ECHMEA, AND MANURE-WATER: A mild infusion of, say, spent hot-bed-manure half-decayed leaves, might be permissible, if poured over the leaves. These plants are epiphytic in their native habitats, and they are doubtless partially nourished by rain-water and dew rotting leaves, that fall into the leaf-receptacles.

TOMATO: Constant Reader. Peronospora infests spray with potassic sulphide, 1 oz. to 3 gal. water; or use the Bordeaux Mixture.

TOMATOS: T. S. B. The leaves are partly destroyed by a parasitic fungus, probably the same as which causes the Potato disease. We will destroy the affected plants to prevent further mischief.

VEGETABLE MARROW: Hybridist. Many, probably unisexual plants occasionally become bisexual Yew, for instance. Again, it is very common the Vegetable Marrow to produce male flowers first, and later on female flowers. We have seen hermaphrodite flowers on the Veg. Marrow. There is no rule without exception in plant life.

VEGETABLE MARROW PLANTS: A. Y. Pinchi. Moderation may be recommended, as it is in developing fruit-bearing laterals. When grown in these plants in frames for early fruiting, pinching becomes a necessity till such time as the vines become warm, and the bine may run outside.

VINES AND MILDEW: Shanklin. For the Vine to be attacked every year seems to point to error in management, or to the neglect of measures to eradicate the pest once and for all. Apply in (flowers of) with a sulphurator or pair of syringing bellows. This may be syringed off before sending them to table, or use the Bordeaux Mixture. In the late autumn, thoroughly clean the vine, taking out a layer of the soil of the tub substituting fresh loam and dung for it, and wash the Vines with the Bordeaux Mixture. Limewash walls, putting a handful of mixed sulphur water as thick as table mustard into the lime. Sulphur and sour milk and lime should be used to paint the hot-water pipes, and the Bordeaux Mixture should be used on the Vines once or twice after flowering. Arrange the ventilation so as to be able to give air at the top of the house less or not any by the front sashes. See if plants apt to be infested by mildew are grown in the vicinity of the house.

COMMUNICATIONS RECEIVED.—C. N.—H. A. G.—F. H. & Sibray (next week).—J. of H.—E. J. B.—Chrysanthemum Society.—Lincolnshire Echo.—H. O. Geneva.—C. Y.—G. Southport (next week).—Ch. S. Moore.—R. D.—M. D.—J. B.—H. H. D.—E. C.—J. J. W.—G. W. E.—D. R. W.—A. C. F.—T. B.—W. B. H.—G. D.—H. M. E.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 14, 1897.

ASTER SICKNESS, AND ITS CAUSE.

ON July 25, I happened to be staying at King's Hill, in the parish of Wednesbury, Staffordshire; and during the afternoon my host, Mr. Smallman, mining engineer, took me round his garden. While we were examining the flower-beds, he drew my attention to those which were planted with China Asters, and remarked that they were a complete failure. For several years he had prided himself on his success as an Aster-grower, but this year he had not produced a single perfect blossom. The plants grew some 4 to 6 inches high, but after being bedded-out made little, if any, progress, and soon began to shrivel or dry up and sicken off. He had heard that several other growers in the neighbourhood were similarly situated, but could not tell what was the cause. My off-hand remark was, "You probably have a little worm called *Tylenchus* at the root," a thought which naturally suggested itself to the mind of Dr. Masters also when I reported the case to him. Pulling up one of the affected plants, and looking at the roots with my pocket-lens, I immediately found what I thought to be the *Tylenchus*, and handed it to my friend, that he might see the cause of all his trouble. I then lifted a couple of other affected plants, and put them in a tin, for the purpose of determining the species on reaching home. On the following day I found a number of worms living gregariously within the tissues of the roots, but was greatly surprised, on putting them under a low power of the microscope, to discover that they were not *Nematoids* at all, but well-developed and clearly characterised oligochaets belonging to the *Enchytræidæ*.

Owing to the fact that nothing is said about the life-habits of the species which it most nearly resembles, I shall in this paper assume that the worm which causes the Aster sickness is a species new to science, as it certainly is to Britain, and shall describe it accordingly. I shall then draw attention to one or two matters of practical interest to florists and gardeners.

ASTER-WORM: *ENCHYTRÆUS PARVULUS*, Friend.

The worm is 3 to 5 mm. in length, or about an eighth of an inch (see fig. 27, p. 98). It is therefore the smallest species known to science, since Tauber's *E. minutus* is insufficiently described, and cannot be certainly identified. Viewed under a pocket lens, it is white or silvery, and when seen under the microscope, the first six or seven segments are pellucid, while the remainder of the worm's intestinal organs are covered with dark cells. The character by which it may be most readily distinguished by the microscopist who is not a specialist in worms,

is the number and arrangement of the setæ. As in other oligochaets, there is an entire absence of setæ, or bristles, on the first segment; while on the twelfth segment, which bears the girdle or clitellum, and the male-pores, the ventral bundles are missing. All the other segments, of which there are thirty in an adult worm, bear four bundles of setæ, of which two bundles are lateral and two ventral. In the first eighteen segments, or thereabouts, there are three setæ in each ventral bundle, and two in each lateral; but in the last ten or twelve segments each bundle, ventral and lateral alike, has three setæ. Thus the bundles are all either couples or triplets, and the order and arrangement are definite, not irregular or promiscuous. There is a large head-pore between the prostomium and the first ring, i.e., the one without setæ, and when a little pressure rests upon the worm's body, the fluid and particles contained within the coelomic cavity and head are poured out of this aperture, thus relieving the pressure. The brain is somewhat pear-shaped, rounded off, or convex at the hinder margin, and there is a slight tendency on the part of the ventral nerve-cord to broaden between the third and fourth segments. The blood-vessels and other parts are of the usual type; the girdle is slightly papillose, and accompanying the pores on the twelfth segment are somewhat large vase-shaped glands.

AFFINITIES.

It will at once be seen that the worm comes very near to *E. argenteus*, Michaelsen. I regret that Dr. Michaelsen, who has favoured me with several of his monographs, has not been in possession of a duplicate of his article in which this species is described. I am, therefore, limited for information to Mr. Beddard's brief digest in his admirable *Monograph of the Oligochaeta*. He gives the following definition and note. "*E. argenteus*, Mich.: length 5 mm.; number of segments 30; setæ, 2 or 3 per bundle. Brain convex behind. Anteseptal part of nephridia of equal diameter with postseptal part, containing also a coiled lumen; duct comes off at right angles, and is long and distinct. Habitat, Germany (Elbe shore). This species appears to be the smallest of the *Enchytræidæ*. The name of the species was given to it on account of its silver colour, due to the dark pigmentation of the perivisceral corpuscles." It seems likely that the British and German forms may be ultimately referable to the same species. In that case the name *parvulus* will be withdrawn.

ENCHYTRÆIDS AS PLANT PESTS.

In the valuable little work on the *Plant Life of the Farm*, by Dr. Masters, we read (p. 135) that "Death at the root may result from injury inflicted by small parasitic worms, &c." Against this I made a reference some years ago to the article in *Nature*, vol. 40, p. 11, May 2, 1869, by Mr. Allen Harker on "A New Pest of Farm Crops," in which the writer adduces evidence that not only flowers in gardens, but Clover-plants in fields are injured and destroyed by species of *Enchytræus*. Curiously enough, though the fact has been more than once referred to since, our great authorities on this group of annelids make no allusion to the predatory life of the worms belonging to this genus or order. I have frequently examined white worms belonging to the *Enchytræidæ*, which were living on the roots of plants; and have notes of more than one species new to science which were infesting grass crops, so that it may be regarded as a

well-established fact that the white worms belonging to the genus *Enchytræus* and its allies are destructive to plants.

Mode of Action.—My observations confirm those of Mr. Harker. The minute worm obtains admission to the roots and rootlets, and lodges under the epidermis, where it sucks the juices of the plant, or even (as microscopic examinations shows) breaks up its cell structure and swallows the vegetable tissues, thus preventing the plant from sending moisture and nutriment through the stem to the leaves. Though the worms have no teeth, their mouths act as suckers, and they very quickly divert the nutriment from the ordinary channels to their own oesophagus, to the ruin of their host.

Naturally enough it will be asked, "What is the remedy?" It must not be assumed that all decaying Asters are eaten of worms. If, however, the lens reveals their presence, drastic measures must at once be adopted. If it were possible, the moment sickness showed itself, to lift the plant, excise the injured part and re-set it, the evil might be arrested. There would, however, still be two dangers. The plant might be unable to recover, and if it did, the eggs of the worm, which are infinitely small, and would never be detected, may have been deposited in the tissues. This being so, young worms will soon appear again, and the plant succumb after all. The only way to ensure the destruction of the pest when once in the plant, is to uproot every sickly individual and consign it instantly to the flames. Should any florist or gardener, whose flowers (whether Asters or otherwise) are affected, discover traces of worms about their roots, I shall be happy to submit them to examination and report the results. Specimens should be sent in tins to prevent the worms drying up, with a stamped addressed envelope for reply, to Rev. Hilderic Friend, Ocker Hill, Tipton. *Hilderic Friend*.

THE DISEASES OF PLANTS.

(Continued from p. 61.)

II.—REMEDIAL TREATMENT FOR DISEASES.

IN spite of all precautions, fungous diseases will almost certainly make their appearance where plants are grown to any extent. The methods suggested for combating diseases of fungous origin are far too numerous to allow us to follow each in detail. In many cases, too, there is as yet considerable difference of opinion as to the application of remedies and their success. Fortunately, the remedies against fungi may be classified into certain groups, so that their application may be indicated in a simple manner with fair accuracy. It is impossible here to prescribe in detail, because the treatment necessary for each case varies according as the plant attacked be Carnation, Rose, or any other; even varieties of the same species, or a difference of locality, may require a change in time or mode of application of the remedy used. Our aim for the present is to indicate safe principles, leaving details till further observations allow one to say more exactly the treatment necessary for each plant in each locality.

Mildews.—A very large number of plant-diseases are caused by parasitic fungi, which form downy, floury, or mealy coatings on the foliage, twigs, or fruits of their host-plants. These coatings are commonly spoken of as "mildews," and are caused by forms of fungi widely separated in the classifications of the scientific fungologist. The methods applicable

for combating them fall into two distinct classes: (1) treatment by application of dry powders; (2) treatment by spraying.

Powders as Fungicides for Downy Mildews.—Fungicidal powders have been employed with most success against the fungi known as the false or powdery mildews—the *Erysipheæ*; they occur on nearly all cultivated crops, particularly on Roses, Apples and allied fruit-trees, Gooseberry, Peas and Beans, Cucumber, and Vines. These fungi are distinguished by living on the surface of their host-plants, and only sending tiny suckers into the inner tissues. The summer conidia or spores give the mildew-like appearance so characteristic of these fungi, and spread the disease rapidly; the winter spores are housed in capsules, which appear as black points on the dead or dying remains of diseased plants. Since these fungi live exclusively on the surface, their treatment is fairly simple, and usually effective. To sprinkle infected parts with sulphur in some form is one of the commonest methods used. The sulphur may be applied dry, as flowers-of-sulphur alone, or mixed with quicklime; a light brush, rabbit's tail, sulphur puff, or other implement should be used to sprinkle the powder lightly and evenly. An objection to dry sulphur is that it does not adhere well to some kinds of foliage, but is readily blown or washed off; this is counteracted by mixing the sulphur with quicklime or with water in proportions varying from one ounce of flowers-of-sulphur in five galls. of water up to several ounces per gallon of water. A useful sulphur-lime mixture is known as Grison's fluid; it consists of flowers-of-sulphur 3 lb., quicklime 3 lb., water 6 gallons. This is boiled till the liquid is reduced to two gallons, allowed to settle, then the clear liquid is drawn off into bottles and kept well corked; when used, one part of the stock solution is diluted with 100 parts of water. Some Rose-growers add soft-soap and petroleum to mildew mixtures, thus making the treatment a combined one, directed, not only against mildew, but also at green-fly or other insect pests. A mixture of this kind recently recommended in the *Gardeners' Chronicle* consisted of 1 lb. soft-soap boiled in 4 quarts of water, then one wine-glassful of petroleum and four of flowers-of-sulphur added; the whole was kept as a stock solution, and diluted as required with about twenty parts of water to each part of solution. Sulphur vapour produced by gently heating flowers-of-sulphur is a combined fungicide and insecticide for indoor use, but it must be carefully used where foliage is delicate. Bordeaux Mixture and other copper mixtures described below are efficient remedies against powdery mildews; where these are already in use for spraying there need be little fear of the surface mildews. Powders containing salts of copper, e.g., Fostite and David's powder, have been used in the dry condition for mildews of all kinds, but no advantage can be claimed over Bordeaux Mixture and solutions of an allied nature.

Wherever mildew is present, great benefit will result if the mildewed leaves be hand-picked and burnt, provided the number taken off will not hurt the growth of the plant. A light and careful pruning of mildewed twigs, e.g., of Roses, either during summer or in early autumn, followed by immediate burning of the prunings, is a capital preventive measure for the next season, and for the same reason it is best to burn all prunings from plants liable to mildew, and so destroy the winter spores.

Spraying Mixtures as Fungicides.—The downy mildews present another large group of fungi well known for their ravages on cultivated crops. Amongst them are the cause of the Potato disease, the true mildew of Vines, Onions, Pansies, and other species belonging to the *Peronosporæ*, as the group of the true or downy mildews is called. In their effects, the downy mildews are distinguished from the powdery by the rapid death of foliage attacked; for, whereas the latter forms of mildew are superficial and may be present over whole leaves before withering of any of the plant results, with the downy mildews (e.g., Potato disease) the foliage becomes brown-spotted within a short time of attack. This arises from the fact that the downy mildews live inside their host-plant, and prey on the softer tissues, which they rapidly kill and cause to dry up. The conidial spores alone appear on the outer surface, either over the whole of a dead spot, or round its margin; the winter-spores are to be found in remains of plants killed. This mode of life is shared by many other fungi quite distinct from the *Peronosporæ*, but because they live chiefly on foliage or young twigs, and produce dead spots bearing conidial and other spores, the methods

prevent stealing, and found that Vines so treated remained free from certain disastrous diseases. Some of the more important preparations of copper may be considered in our next, *William G. Smith, Edinburgh.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

ERIOPSIS HELENÆ, Krzl., n. sp.*

THE flowers are the largest yet found in this genus, and they resemble at first sight those of *Eriopsis biloba*, Lindley, but they are more than twice as large as in this species. The callosities on the lip show by their character that the plant is nearer to *E. sceptrum*, Rehb. f., but the flowers of the latter are of about the same size as those of *E. biloba*, and the middle lobe of the lip is quite different. The plant is undoubtedly the finest species of this small genus; it was imported from Peru by Mr. F. Sander, St. Albans. *P. Kränzlin.*

NOTES ON HATFIELD.

DURING a recent visit to these celebrated gardens, I was pleased to see that improvements have been steadily carried out in order to keep them abreast of

FIG. 27.—ASTER-WORM, ENCHYTRÆIS PARVULUS (FRIEND). (SEE P. 97.)

A, Worm, actual size $\frac{1}{2}$ -in.; B, hind segment; C, front segment.

of treatment against their attacks are in the main points similar, and we propose to consider them together. To this class belong many common leaf and fruit-spotting diseases, a number of so-called "blights" or mildew-like enemies of almost every cultivated crop and vegetable, and not a few diseases of garden plants, especially Carnation, Mignonette, Tomato, &c. The diseases known as Anthracnose also come into this group; they are common on Vines, Raspberry, Kidney Beans, and other cultivated plants. This great and heterogeneous class of fungus-diseases has attracted much attention from the almost mysterious way they make an appearance, and from the great frequency with which they are met in garden, orchard, and farm, as well as the annoying persistency with which they not only destroy whole crops, but cause spotting or stunt growth, so that the market value of produce is considerably lowered. It is against this host of troublesome diseases that the fungicide known as Bordeaux Mixture, and other mixtures of allied nature, have been so successfully applied. These mixtures are essentially solutions of some salt of copper made up in various ways. Compounds of copper have been known to check mildew and smut since the beginning of the present century, since the vineyard-owners of France and Italy sprinkled the Vines nearest the roads with verdigris to

the times. For example, some of the ordinary bedding-out arrangements have been discontinued, and many more herbaceous plants are grown than formerly, these being more in character with an ancient mansion like Hatfield than *Calceolarias*, *Pelargoniums*, and similar bedding-plants. Whatever is attempted here is well done, and usually an immediate effect is required and secured. The ground had been well trenched and manured, new soil being added when found to be necessary, and the growth of the plants was very different to that one often sees in old gardens. The middle of July is not the best time for seeing herbaceous flowers, the early summer varieties being then mostly over, but I noticed *Delphiniums* in many fine varieties, *Coreopsis lanceolata* (one of the prettiest things for cutting), *Lychnis chalcedonica*,

* *Eriopsis Helena*, Krzl., n. sp.—Bulbis maximis, 40 cm. longis, internodio 1 longo, 8 brevibus compositis minute striatis ceterum levibus; foliis lineari-lanceolatis ad 50 cm. longis, 2-5 cm. latis acuminatis; scapo ad 50 cm. longo; crasso valido apice nutante; racemo pauci-plurifloro; bracteis minutis subnullis; ovario c. pedicellis ad 4 cm. longis; sepalis oblongis obtusis, lateralibus quam dorsale paulo brevioribus basi ipsa connatis; petalis angustioribus ceterum aequalibus luteo-aurantiacis purpureo-marginatis; labelli lobis lateralibus transverse oblongis antice liberis obtusis erectis (non semi-reniformibus) sinu rotundato inter illos et lobum intermedium, lobo intermedio obovato-spatulato antice rotundato (neque triangulo neque emarginato), lamellis 2 triangularibus supra divergentibus in disco inter lobos laterales, disco punctulato-puberulo; gynostemio clavato omnino generis. Flores illis *Eriopsis bilobæ* Lindl. et *E. sceptri*, Rehb. f., majores 3-5 cm. diam., sepalis petalisque aurantiaca purpureo-marginata; labellum eodem colore sed macula intense lutea punctis violaceis circumdata in ipsa basi et lobo intermedio eodem colore; gynostemium viride. *P. Kränzlin.*

Achillea ptarmica flore-pleno, *Alstroemeria aurantiaca*, *Chrysanthemum maximum*, &c., doing well. *Phloxes* had just commenced flowering, and many other things were following in succession; and plants of *Tropaeolum speciosum* were growing exuberantly and flowering abundantly on a west wall.

The beds on the south side of the house were tastefully filled with standard *Fuchsias* in variety, carpeted in some instances with an undergrowth of *Swainsonia galegifolia alba*, in others with *Heliotrope*,

walls, arbours, and arches; many gardens would look more inviting if these adjuncts were constructed and covered with *Roses*, *Clematis*, &c.

Fruit of all kinds is required in large quantities at Hatfield, and it must be of the best quality. Mr. Norman, the gardener, is an advocate for "extension training," and he had a fine tree of the Royal George Peach to show with over 400 fruits on it, which would convince anyone of the soundness of this method of training. The tree was planted about

of light for ripening the fruit and the wood. A tree of Brown Turkey Fig on the back wall of this house was carrying a heavy crop of large fruits. One naturally enquires about Strawberries at Hatfield, after seeing the fine specimens which have been exhibited at various times, and I found that potting was just commencing; and the plants were strong and healthy, with roots already pushing through the bottom of the small pots in which they had been layered. Royal Sovereign is at present the favourite variety. Sir Charles Napier, President, and Vicomtesse H. du Thury, are also grown in good quantity. About 7000 plants are annually forced; and, in order to ensure high quality, a portion of the kitchen-garden is planted annually for the purpose of supplying runners; thus, a good commencement is made by obtaining extra-strong and early plants.

Grapes are grown well and largely. Black Hamburgh, Madresfield Court, Gros Colman, Lady Downes, and Muscat of Alexandria being those chiefly cultivated, and the Vines showed good useful bunches in plenty.

The Plant-stove was gay with large specimens of *Adiantum Farleyense*, *Anthurium Veitchi*, *A. Warocqueanum*, *A. Andreanum*—the latter plants were in flower, and were growing in cylinders of sphagnum-moss built up about 2 feet high above the pots; *Cissus discolor*, and other plants at intervals, gave variety. At one end a fine lot of *Saccolabium Blumei*, with large spikes of flower, were suspended in baskets; also some very fine plants of *Gloriosa superba*, in full flower—this is always welcome on account of its prettily-formed, richly-coloured, gay flowers.

Carnations were not quite over indoors; King Arthur, a fine scarlet, as large as *Souvenir de la Malmaison*, was especially noticed, also Miss Audrey Campbell, the finest yellow I have seen. A few very large *Malmaisons* remained. Other kinds grown are Winter Cheer and Uriah Pike. *Cyclamens* are raised from seed annually, the seed being sown in October. About 1000 plants are raised, and these were accommodated in cool pits at the time of our visit, the earliest plants well set with flower-buds, and all looking vigorous. *Cyclamens* are much employed for decorating apartments in the winter season. I saw houses filled with *Dracenas*, *Crotons*, *Cattleyas*, *Calanthes*, and *Cyclogynes*, each of which has a house devoted to it, and all are cultivated in the best manner; but *Scutellaria Mocciniana* must be mentioned specially as a most effective plant seldom seen in good condition, and dotted among Maidenhair Fern, it had a pretty effect.

The kitchen garden was well cropped with vegetables of all kinds, and appearances showed that plenty of the right sort of manure, deep cultivation, timely sowing and thinning, were matters that received full attention. A fine piece of the Criterion Pea was in bearing, and cropping better than any of the new varieties; the quality of the Pea is excellent.

Apple and Pear bushes in the kitchen garden were carrying good crops for the season, and the extension system has been followed in the case of the kinds, and the high state of fertility in which the garden is kept doubtless imparts great vigour to the trees, and enables them to withstand the vicissitudes of the weather. W. H. Divers, Belvoir Castle Gardens, Grantham.

ROSA WICHURAIANA.

THERE are very few of the wild types of *Rosa* whose flowering time comes so late in the year as the end of July and the beginning of August, but of those few *R. Wichuriana* is one (fig. 28). It is of very recent introduction, but the distinct character of its growth and the late date at which it blossoms, have already obtained for it considerable notice in this country, although not so much as in the United States, where it is already a popular shrub. It is a native of Japan, and reached this country by the way of the United States about five or six years ago. The two characters which more than any others distinguish this Rose are its procumbent habit, and the very lustrous dark green colour of its leaves, these

FIG. 28.—ROSA WICHURAIANA, HARDY ROSE: FLOWERS WHITE.

and edged with *Begonia Worthiana*, *Fuchsia Meteor*, *Lobelia Hatfield Blue*, and various other plants, good strong plants having been put in which had already filled the beds.

On the east front, zonal *Pelargoniums* have been chiefly relied upon for effect, with just a few foliage plants to afford variety and contrast. *Pelargonium E. V. Raspail Improved* proves to be as useful a variety for bedding as it is in the winter as a pot plant. The Crimson Rambler Rose is extensively used, and was flowering freely in various places. It is one of the best climbing *Roses* for quickly covering

twenty-two years ago in a span-roofed house 50 feet long, which it now fills. Owing to the situation of the house, which is much shaded by others, the width of the tree is only 8 feet; thus there are 400 square feet of trellis covered by the tree, and the fruits were large, and fit for exhibition purposes—its proof of good culture. In another house a fine tree of Lord Napier Nectarine was heavily laden with its large fruits. This house is a lean-to facing west—not therefore an ideal aspect for forcing Nectarines; but this disadvantage has been partly overcome by training the branches horizontally, letting in plenty

being, indeed, so bright on both sides as to suggest their being coated with varnish. Each one consists of five, seven, or nine leaflets, which are oblong or elliptical, serrated, and from $\frac{1}{2}$ to 1 inch long. The petiole bears a few short spines and bristles, and the stipules have their margins set with glandular teeth. On the strong, succulent, non-flowering shoots of the current year, the wood is armed with stout curved spines, but on the thinner-flowering shoots of the following year they are mostly arranged in pairs just beneath each node. The flowers are of the purest white, and the clusters appear just above the dense carpet of glossy leaves, which completely covers the soil. Each flower is upwards of 2 inches in diameter, the petals (normally five) often numbering six or seven under cultivation. This species should be given a rich soil, and, what is of equal or greater importance, the sunniest possible position. It is, no doubt, the intense and prolonged sunshine it receives in North America that causes it to flower so abundantly there. It is a plant of vigorous and luxuriant growth, and can be increased with the greatest ease by means of cuttings put in during the next two or three weeks. *W. J. B.*

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 63 to 69)

(Continued from p. 84)

3, ENGLAND. E.

CAMBRIDGESHIRE.—The early prospect for fruit was very good; the cold winds and late frost (mostly the latter) caused the destruction of Apples, Plums, and Pears, also thinning the crop of Gooseberries, Red Currants, &c. *J. Hill, Babraham Gardens.*

— Of Apples, Lane's Prince Albert is by far the best crop this year, a local Apple, called Emmeth Early coming next. Of Pears, the Hazel is very good, also Beurré d'Amanlis. Gooseberries were under average, but the prices have more than made up for the deficiency. *Wilson C. Smythe, Upwell House Gardens, Wisbech.*

ESSEX.—The fruit crop here is almost a failure, on account of the late frost we had in April. There was an abundance of bloom on Apples and Pears. *F. King, Havering Park, Romford.*

LINCOLNSHIRE.—The fruit crops have turned out rather poor in this district, owing, no doubt, to the prolonged cold north-east winds which prevailed during the time the trees were in blossom; nevertheless, the majority of the trees are making good and clean growth. Amongst the Apple crops, Codlins are carrying by far the heaviest crops. Plum-trees are bearing very badly in this neighbourhood; in fact, I think I may safely venture to say poorer than they have done for many years past, and there is also a scarcity of small fruits in general. *J. Rowlands, Manor Gardens, Bardney, near Lincoln.*

NORFOLK.—Most kinds of fruit are much below average, Pears being the best. I have good crops of Doyenné d'Été, Beurré d'Amanlis, Citron des Carmes, Williams' Bon Chrétien, Louise Bonne of Jersey; all others being very thin. Of Apples there is none. *H. Batchelor, Catton Park, Norwich.*

— I never remember such a poor crop of Apples in this part of Norfolk; not a tree to be seen anywhere even carrying a third of a crop. Plums the same, very thin; just a sprinkle of some kinds, but the trees generally barren. *William Allan, Gunton Park, Norwich.*

SUFFOLK.—In this district the Apple crop is poor, and the trees have been much blighted. Pears are good, and quite up to the average. Peaches and Nectarines are fairly good, though the trees have suffered much from blister. Apricots are a failure. Of Cherries, Morellos are good, but dessert kinds are not so satisfactory. Small fruits are plentiful and good, particularly Gooseberries; these did not suffer so much from late frosts as in some years, which I attribute to the dryness of the atmosphere, and also to the trees having a good sprinkling of foliage at the

same time. In many gardens the first bloom on Strawberries was destroyed by late frosts; still, the crop has been heavy, and the fruit of first rate quality. *H. Fisher, The Gardens, Plizton Hall, Bungay.*

— With the exception of the Strawberry, crops of hardy fruit that had no protection in spring are much below the average. Peaches and Nectarines on walls, which were protected on cold nights by curtains, are a good crop; but Apricots, that had the same attention, are a failure. *J. Wallis, Orwell Park, Ipswich.*

— The fruit-crop around this immediate neighbourhood cannot be considered very satisfactory. Apples are poor; Pears are a better crop, but not a heavy one. Of Apricots there are none. Peaches and Nectarines have fairly good crops, but the trees have been much affected with blister. Plums are average; more in some gardens than in others. *B. Marks, Hardwicke Gardens, Bury St. Edmunds.*

4, MIDLAND COUNTIES.

BEDFORDSHIRE.—Apples thin, but trees very healthy, making good growth; Pears thin indeed except on walls of east aspect; Plums are also thin except on walls of south aspect; Cherries generally very thin; Peaches and Nectarines very good indeed on unprotected walls, clean, and making good growth; Apricots very thin and scarce; small fruits thin and scarce except Raspberries, which are very good. *G. R. Allis, Old Warden Park Gardens.*

BUCKS.—All fruit-trees bloomed fairly with exception of the Damson; but the weather was very unfavourable during the whole blooming period, and, as a consequence, very little bloom set. All Plums are quite a failure. Apples may average half a crop; some trees which are in a little more sheltered position are a full crop, while others are bare. All trees clean and healthy. *J. Jaques, Waddesdon, Aylesbury.*

— Although the crops of Apples are much under the average, the quality is good, and the trees remarkably free from blight; this latter remark may also be made respecting Pears. The quality of bush-fruit is excellent, no traces of blight or caterpillar having been seen. Strawberries would have been an extraordinary crop had not the earliest blooms been destroyed by frost; notwithstanding this, however, the crop is good both in quantity and quality. Plums and Damsons in some orchards are complete failures. On the whole, the crops are very scanty, but the trees are healthy and clean. *W. Hedley Warren, Aston Clinton Gardens, Tring.*

— The county of Bucks is proverbial for its Cherry and Plum orchards, and many of both abound in this district, Cherries more particularly, and the loss by reason of defective crops will be considerable. In this locality the flowering period was not arisies, and a good set was secured; but the state of the weather afterwards was such as to arrest growth, and cause the mischief and loss that will naturally ensue. Apples are only a partial crop; Pears plentiful; Peaches and Apricots good; plenty of the early kinds of the former now ripe on the walls outside. Black and Red Currants average; Nuts and Walnuts very abundant. *G. T. Miles, Wycombe Abbey Gardens, High Wycombe.*

— Apples are a very partial crop; such varieties as Lane's Prince Albert, Stirling Castle, Keswick Codlin, Niton House, Mr. Gladstone, Oslin, Early Margaret, Yellow Ingestre, Juneating, and Irish Peach, are bearing good crops; while such standard varieties as Blenheim Orange, Cox's Orange Pippin, Duchess of Oldenburg, and many others, have hardly a fruit on them. *J. Smith, Mentmore, Leighton Buzzard.*

— The most serious loss among fruit crops is the scarcity of Apples in this district, especially as regards Orchard-trees. The blossoming was superb, but the cold weather and biting winds experienced crippled the bloom, and the greater part fell off. Out of several varieties, the only ones bearing a fair

crop in orchard are Dutch Mignonne, Red Quarrenden, Sturmer Pippin, Beauty of Kent, Hambledon Deux Ans, and King of the Pippins. Cox's Orange Pippin, Wellington, and Ribston Pippin are slightly cropped. Of bush trees on paradise carrying a fair crop may be mentioned Grenadier (very good), Lord Derby, Cox's Orange Pippin, Worcester Pearmain, Lane's Prince Albert, and Ecklinville. Pears are generally worse than Apples, although occasionally a standard Orchard-tree is seen bearing a heavy crop, one being Beurré Clairgeau. Wall-trees and bushes are scantily cropped, the following comprising the best:—Williams' Bon Chrétien, Bergamotte d'Espere, Beurré Hardy, Josephine de Malines, Madame Teyre, Beurré d'Amanlis, Knight's Monarch, and Doyenné Boussoch. Plums a very poor crop; Cherries on walls good, Orchard poor; Peaches and Nectarines very good, and required much thinning of fruits; trees healthy. Waterloo Peaches ripe on July 10. Apricots very poor; small fruits collectively a fair average crop, of good quality. Black Currants rather poorer in crop than others; Strawberries very good, taken collectively; Nuts over average, and promise, from present appearances, to be very good. *C. Herria, Dropmore, Maidenhead.*

CHESHIRE.—With the exception of Strawberries and Apples, this is one of the poorest fruit years we have had for many years. The early blooms of Strawberries were injured by frost, which also as it will be rather unsafe in our climate to have them too early. Gooseberries are almost a failure; so are Plums, Cherries, and Pears, by the continued cold weather, when the trees were in bud and blossom. Some Apple-trees have very good crops, viz., Grenadier, Stirling Castle, Cellini, and Lord Grosvenor; others are very thin. *R. Mackellar, Abney Hall Gardens, Cheshire.*

— This is a very bad soil for fruit-trees—cold and heavy, not allowing the wood to ripen. Apricots do fairly well generally, and I attribute the total failure of this year to the enormous crop last. Damsons seem also a total failure, which will be a great loss to this district. Something has taken the Strawberry-plants, nearly half of which withered and died in spring from no apparent cause. *C. Wolley Dod, Edge Hall, Malpas.*

DERBYSHIRE.—All stone-fruits are very thin crop. Apples good, and Pears a fair average. Small fruits good, excepting Gooseberries very thin. Strawberries abundant, and very good. *T. Kestley, Gardens, Darley Abbey.*

HERTFORDSHIRE.—The fruit-growers of this district have cause to lament the very cold weather and late frosts of the spring, which have seriously affected the greater portion of the fruit crops in this district, notably Plums, Cherries, Apples, Currants, Gooseberries, &c.; entire orchards are absolutely devoid of fruit. The best crop to chronicle this year is Nuts, which is considerably above the average. Pears come next. The yield of Strawberries was very indifferent, only in some cases reaching half crops. In these gardens we have to submit to entire failure in Apples, Apricots, Cherries, Plums, &c., and only quarter crops in Strawberries and Black Currants. Although it is Jubilee Year, many of our fruit-growers are not jubilant, yet many are not depressed, but take calmly and quietly the unavoidable which has to be endured. *Wm. Garman, Frytheaden Gardens, Great Berkhamsted.*

LEICESTERSHIRE.—Apples, Plums, and Cherries blossomed abundantly, but failed to set owing to the cold ungenial weather prevailing at that time; the wind was principally in an easterly direction, but no severe frost occurred. Pears on walls in many instances set much too thickly, and have been freely thinned; these were protected while in flower with double fish-netting, &c. Peaches and Nectarines outside have scarcely any fruit, although they were well protected when in flower; they have suffered severely from blister this season. Plums have a small crop on walls, none on standards. Gooseberries are very scarce, owing to severe frost when they com-

menced flowering. Strawberries have borne a heavy crop of unusually good quality and flavour. *W. H. Diers, Belvoir Castle Gardens, Grantham.*

— There was abundance of bloom upon all fruit trees this spring. The severe frosts and cold prevailing N.E. winds of May made a complete wreck of the Apple crop, Stirling Castle, Peasgood, Lord Grosvenor, and Seaton House, being the only trees which have a crop. Amongst Pears on pyramids, Louise Bonne and Fertility are the best; Beurré Rance, Winter Nelis, Easter Beurré, Marie Louise d'Uccle, Pitmaston Duchess, are the best. Cherries were a great promise, but most of the fruits have fallen at stoning period. *D. Roberts, Prestwood Gardens, Loughborough.*

NORTHAMPTONSHIRE.—The fruit crop in this district will be about an average; Keawick Codlin, Hawthornden, and Lady Henniker are plentiful; late Apples, as a rule, will be very scarce. Pears, such as Beurré Bosc, Williams' Bon Chrétien, Louise Bonne of Jersey, are fairly plentiful, but the late ones were cut off by frost and snow, and cold winds. Apricots were frozen on the trees. We registered 10° and 12° Fahr. of frost two nights in succession during the time they were setting. *H. Kempshall, The Gardens, Lampert Hall, Northampton.*

OXFORDSHIRE.—Apples are considerably under average, but we have a nice sprinkling, especially on bush-trees. Pears on walls are good. Plums, very few; and the same may be said of Cherries. With Peaches and Nectarines we have seldom failed in the crop, but this year the blister took the trees very suddenly, and I never saw them worse; they are now growing out of it to some extent, but the crop is poor, and cannot come to much. The early varieties, Am-eden's June, Alexander, and Waterloo, strange to say, had very little blister, and are carrying fair crops. Small fruits of all kinds have been good, Gooseberries especially. Strawberries were soon over. *George Stanton, Park Place Gardens, Henley-on-Thames.*
(To be continued.)

BURDOCK AS A VEGETABLE.

THE well-known definition of a weed by Emerson as "a plant whose virtues have not yet been discovered," is confirmed by the better agricultural authority of Schwarz, according to whom "a weed is a plant of which the direct uses are unknown to man." Both the poet-philosopher and the scientific farmer implicitly admit, I think, that as man brings more and more of nature under his control—in other words, as he brings more and more plants under cultivation, many of them, hitherto scorned as weeds, must cease to be considered as such. I have often seen ridiculed the Chinese custom of eating birds' nests, bears' claws, and other incomprehensible delicacies, but I cannot help admiring the power of pantophagy on the one hand and the refinement of culinary skill on the other, which can convert into means of human enjoyment things apparently worthless and revolting. If, as philosophers say, civilisation consists mainly in bringing natural forces under man's subjection, China must be given a high place in the scale of civilisation from a culinary point of view.

Is it not a real triumph of art to extract food for man from so coarse and ugly a weed as Burdock? Most books on botany in the English tongue describe Burdock, Lappa major or officinale, as a pestiferous weed, and many an agricultural bulletin gives careful instruction how to destroy it.

The medicinal uses are not to be despised, but they are unimportant when compared to the value of the plant as an edible vegetable; since the kitchen is more important than the drug-store, the cook is nearer our hearts than the apothecary. Even in England the alimentary value of Burdock was not always despised. Sowerby writes in his *Useful Plants of Great Britain*, "The stalks of the Burdock, cut before the flowers open and stripped of their rind, form a delicate vegetable when boiled, similar in flavour to Asparagus. In the raw state they may be eaten with oil and vinegar as salad. They were sometimes candied with sugar in the time of Bryant, as those of Angelica are."

In Japan, Burdock grows wild in several places, but it is also extensively cultivated as a vegetable. Everyone knows and eats it. It is a valuable plant for this purpose.

almost obsolete name is "Kitakis"; sometimes it is called "Uma (horse)-fuki (Nardosmia)." It is familiar to the Ainu under the name of "Seta (dog)-korokoni (Nardosmia)." Both the Ainu and the Japanese prefixes, "seta" and "uma," when applied to plants, seem to have much the same sense as the English "dog," in Dogwood, Dogbane, &c., and the "horse" in Horse-radish, Horse-chestnut, Horse-mint, &c. The Ainu use it as food as well as medicine. They boil the tender shoots with Beans, and the roots are put into soup. For medicinal uses the young leaves are softened by rolling them between the palms, and applied to skin eruptions. The Japanese esteem Lappa for similar purposes. It is used in many preparations for its medicinal properties, which they believe—at least, the old-fashioned empirics believe—consist in counteracting the action of some kinds of poisons. Grated and made into pulp, the roots are applied as a poultice in eruptions of the skin. But by far the more important use is made in the kitchen. As regards this plant we have out-tripped the pantophagous Chinese, for they have not raised the plant to the dignity of a market vegetable. "When young," says a Chinese book on botany, "the tender leaves of the Lappa are cut and eaten as greens; the roots may be boiled or steamed and eaten, but people nowadays rarely use the plant." Among the Japanese, however, it has been under cultivation for years, and possibly for centuries. It enters the kitchen of every household, not being ostracized from the menu of the most high-toned restaurant. Thousands of acres are devoted to its culture. Official statistics for 1888 give the total production of Lappa in the country at about 72,000,000 pounds, valued at 422,134 yen. The roots average 350 grains in weight.

The production of so large a quantity is not at all to be wondered at when we recollect that Lappa ranks high in the scale of nutritive plants. In the amount of nitrogen it stands higher than Potatoes, Beets, Carrots, or Turnips; in fact, few roots or tubers approach it. I append here its chemical composition, as compared with some other commonly used vegetables:—

	H ₂ O	N	Ash	K ₂ O	Na ₂ O	CaO	MgO	P ₂ O ₅	SO ₂	SiO ₂	CL
Potatoes	750	3.4	9.5	5.8	0.3	0.3	0.5	1.6	0.6	0.2	0.8
Sugar-beets	815	1.6	7.1	3.8	0.6	0.4	0.3	0.9	0.3	0.2	0.3
Turnips	926	1.8	6.4	2.9	0.6	0.7	0.2	0.8	0.7	0.1	0.3
Carrots	850	2.2	8.2	3.0	1.7	0	0.4	1.1	0.5	0.2	0.4
Burdock	738	5.6	10.5	4.3	0.2	1.1	2.0	0.9	0.7	0.1	...

So important a crop as Burdock has, of course, many varieties developed, but the best known among them are few in number. They are usually named from the localities where they were first developed, or where they thrive best.

In raising Lappa much attention is naturally devoted to the right selection of the soil. It is a common belief among cultivators that a light sandy soil is specially adapted to it, and it is true that roots grown from such soil are long and slender, but they are prone to be hollow at the centre and rather tough at the rind. A stronger and deeper soil, say clayey loam, seems to impart firmness to the root and a better flavour. To gain the most satisfactory results, the soil must be ploughed deep and finely pulverised, or else an undue amount of labour will be required in harvesting the roots. Indeed, digging Burdock is a proverbially hard task; it has become almost a fine art to do it well. Many an old writer recommends digging the soil to a depth of some 4 or 5 feet, and then putting in green leaves, stalks, turf, and so forth, in a layer of a foot deep, and covering that with the earth that was excavated. The surface must then be well hoed in both directions. So much care, however, is only necessary when exceptionally fine specimens, for show or otherwise, are aimed at. One peculiarity of Lappa is that it is not adapted to rotation—that is, it thrives better if planted continuously on the same soil; in new land the roots are likely to become forked. It is also grateful for good manures—compost, night-soil, and especially to rice-bran—but if compost is applied it must be well decomposed, or else the roots will throw off too many branches.

When the soil is properly prepared, seeds are planted in rows 3 feet apart, five or six seeds being placed every 6 to 8 inches in a row. In Owara, the usual time for sowing is the early part of May or late in April. Before the early part of June the young plants are thinned out, leaving but one in the hill. Very often liquid-manure is applied two or three

times before the roots are harvested, late in December. Another method is to plant the seeds in August, so as to have the vegetable ready for spring use, in which case they are sown more closely, since they do not grow as vigorously as those planted in spring. Lappa is a slow grower, and takes over 220 days to mature. Seeds retain their vitality for five years, and many a gardener asserts that the best crop is obtained from those three years old. They say that new seeds produce roots which throw off too many branches and flower-stalks. This statement, however, is not always verified. For keeping and marketing, the vegetable may simply be left where it was grown, or kept buried in the earth like Beets or Turnips.

I need only state in general terms that, after their skin is scraped or peeled off, the roots may be sliced into long strips or cut into pieces of less than an inch in length, and boiled with soy, salt, or Spanish pepper, to impart savour to them; or, if boiled alone, they may afterward be browned in sesame oil, which of itself will flavour them. Another common way of cooking them is to scrape off the outer skin and cut them into pieces about 2 inches long, then, when they are boiled soft, to take them out of the pan and mash them; then make them into cakes, much as you treat Oyster-plants. A kind of salad, though not uncooked, is also made of them. A rather unique and more elegant process consists in stuffing the roots with sea-eel and boiling them, after dipping them in a preparation containing soy and pepper. Slices of Lappa fried and eaten with some condiments form one of the commonest dishes with us. The roots are sometimes pickled in miso. There are many other ways of preparing this valuable vegetable for table use, but a longer description would be interesting or amusing only to the curious. *Inazo Nitobe, in "Garden and Forest."* [Several years ago we presented samples of this vegetable to Chiswick and to the Fruit Committee, but the vegetables failed to interest the committee, and we heard no more of it at Chiswick. ED.]

BEDDING IN HYDE PARK.

A GREAT French artist once said, "Painting is an art of many sacrifices." It may be well said that gardening, from the picturesque point of view, is also "an art of many sacrifices." As it is practically the making of pictures with living flowers, the artist-gardener must make a selection of restricted material that will give the most beautiful effects in his garden-pictures.

To any one conversant with the style of bedding in vogue, say, twenty-five years ago, a stroll just now along the flower-beds in Park Lane would suggest thoughts giving food for a very interesting mental reflection. It (the bedding) in those far-off days was a huge advertisement, a sensation garden—thousands of a varlet Pelargoniums massed in one bed, between "dowdy" Perillas and yellow Calceolarias; ribbon-borders and pin-cushion beds in plenty, and, in fact, all the floral millinery available.

The area bordering on Park Lane was then a part of the park devoted to "carpet-beds," the designs for which were copied (as the style literally expressed) from carpets or other unsuitable samplers. It was, indeed, a case of covering space by line and measure with geometrical designs (how stiff and formal it all was!), and, as has been well expressed, this giant geometry had "taken possession," ejecting much that was good of old in the matter of herbaceous perennials and beautiful annuals. At the present time, in the vicinity of Park Lane there is only about one bed devoted to carpet-bedding, a good example that has been generally followed. The kind of display of flowers in Hyde Park continues to gain favour with the public, and it may be described in short as the mixed or blending. Whilst the Superintendent, Mr W. Browne, works on quite modern lines, he manages to introduce many of the old-fashioned plants which were so much the admiration of the people a quarter to half a century ago, rightly availing himself at the same time of more recent introductions that will be beautiful, and give increased interest to the flower, and mixed beds.

It is a problem not of easy solution to find something fresh to present to the public every year. "John Bull" is now, more than ever, exacting. He is a kind of horticultural Shrook, and insists upon having his "pound," regarding his flower-pots pretty much as he

does his big dinners!—they must be *en evidence*—a species of rotary transformation-scenes! He does not like to “wait for results,” but has become impatient; and, in fact, expects to see a new thing every day!

An inspection of matters horticultural at Park Lane this season makes it evident that, whilst the insatiable public may not be entirely satisfied, “new ideas” are being carried out, although necessarily, in the matter of planting, it is not found possible to employ entirely new plants.

The beds which were a short time ago filled with Pansies, Violas, Solomon's Seal, Aquilegias, &c., all of which did remarkably well, have disappeared, and they are now replaced with Lilliums, Erythrinas, Fuchsias, Celosias, &c. To refer to some of the beds which attracted most attention on a recent visit, to justify my remark as to the use of old-fashioned plants, here the visitor will see the yellow-flowered *Calceolaria amplexicaulis*, introduced from Peru in 1845, in association with the beautiful dark-flowered *Fuchsia Marinka*, a splendid illustration of the happy marriage “of the old and the new!” Another charming arrangement is constituted by the graceful light-flowered *Fuchsia Mrs. Marshall*, mingling with the dark *Heliotrope President Garfield*, standing on a carpet of vivid *Alternantheras*. Then the eye is carried to a bed in which *Vallota purpurea* is mixed with *Canna Queen Charlotte*, the splendid dark crimson flowers of the former contrasting very effectively with the golden and crimson stripes of the latter. Then, again, the old *Michaelmas Daisy* mingles its slender branches amongst the delicate pink flowers of *Ivy-leaved Pelargonium Madame Crousse*. Effective is the association of *Fuchsias Marinka* and *Mrs. Marshall* with *Pelargonium Madame Crousse*, having some dot-plants of *Begonia castaneifolia*, which latter, although not a tuberous, and a purely evergreen variety, makes a capital bedding-plant, have a good effect. *Erythrina crista-galli*, with its attractive bunches of orange-coral-coloured blossoms, with plants of *Carnation Alice Ayres*, whose flowers are white, tipped with carmine, and of fine quality, and a strong grower, on a carpet of *Violet Blue Bell*, arrested attention. A graceful bed is formed of *Heliotrope President Garfield*, with its bright mauve-purple flowers amongst the dark-flowered *Fuchsia Marinka*; *Celosia plumosa* and *Lilium lancifolium* intermingled, will make a very showy bed soon. A bed of *Carnation Alice Ayres*, on a carpet of *Viola William Neil*, was much admired. The light-coloured *Carnation*, on a ground of the mauve-coloured *Viola*, produced a very pleasing effect. A mixed bed of *Pelargoniums* with *Coreopsis tinctoria*, having a carpet of the *Silver Kœniga variegata*, was very telling. A small bed of *Cuphea platycentra* (commonly called the Cigar-plant), a good old bedding-plant, with yellow and crimson tubular flowers; *Alonsoa lucidaifolia*, a charming plant, of easy culture; *Acalypha musaica*, having a carpet of *Kœniga maritima*, was a pretty feature. A very telling arrangement consisted of *Heliotrope Roi des Noirs*, blackish-purple, white eye, and very distinct; dot-plants of *Celosia plumosa*, a carpet of *Alternanthera magnifica*, with a band of *A. amoena*; *Cosmos bipinnata*, another good old-fashioned plant, introduced as far back as 1799! with a carpet of *Viola lilacina*, and dot plants of that finest and purest amongst the yellow self *Carnations*, *Germania* to wit, make a very light and elegant bed. A remarkably good and effective arrangement consisted of *Fuchsias Mrs. Marshall* and *Scarcity*, *Canna Queen Charlotte*, white-flowered *Antirrhinums*, and *Vallota purpurea*. A pair of beds filled with large crimson-flowered *Pelargoniums* with plants of the *Golden Privet* produce a very rich and striking effect.

Fuchsia Mrs. Marshall, dots of *Acalypha grandiflora*, with a band of *Fuchsia Meteor* (the latter attractive if only for its foliage, the lower leaves buff-yellow, the upper ones rich crimson), having *Ten-week Stocks* growing up between them, make a very elegant bed. One that attracted instant attention was the following arrangement:—The well-known and beautiful *Plumbago capensis*, with groups of *Streptocodon Jamesoni*; this, though an old greenhouse plant, is quite a new thing in bedding, and, so far, it seems to be an

acquisition. The flowers, on first opening, are of a pale colour, changing to a brilliant cinnamon-red—quite distinct from any plant in use here for summer-bedding, and contrasting splendidly with dots of that fine *Pelargonium Henry Cannell*, and the dark-flowered *Fuchsia Scarcity*. It had a carpet of mixed *Godetias* and *Jacobæas*.

Some beds of crimson *Begonias* with plants of *Coreopsis tinctoria* have not done so well at present, the sun and dry weather not suiting them; but in cooler weather they will soon improve. *Heliotrope President Garfield*, planted in groups with *Fuchsia Mrs. Marshall* and *Ivy-leaved Pelargoniums*, and dots of the beautifully scented (at night) *Nicotiana affinis*, make a charming bed. *Fuchsia Scarcity*, planted six in a group, with intermediate groups of *Ivy-leaved Pelargonium Galilee*, rosy-pink, very double flowers, make a pretty bed.

Another bed planted with *Fuchsia Mrs. Rundle*, tube and sepals salmon, corolla rich orange-scarlet, and *Pelargonium (Ivy-leaved) Souvenir de Charles Turner*, flowers deep pink, feathered with maroon, very large pipe and truss, is well worthy of mention. *Fuchsia Madame Cornelliessen* is showing well for bloom, but is rather later than usual; a good flower display will be made in a short time. A bed of dark-flowered *Heliotrope*, with the yellow *Coreopsis*, is a very showy bed.

The usual groups of *Palms*, *Bamboos*, *Araucaria excelsa*, and *Eucalyptus globulus*, arranged behind and between the beds, all help to give the whole arrangement an enchanting effect. J. B.

FEEDING-MULCHES FOR FRUIT TREES, CORDONS, AND BUSHES.

HAVING at Syon a thin soil that rests on gravel, mulching is very necessary, especially in the case of trees and bushes, &c., in the open ground in a hot summer like the present. The month of April this year was not a genial one as regarded the weather, and cutting winds prevailed for weeks; but little rain fell, and drying winds continued to blow till well into May, rendering the mulching of young fruit trees very necessary, especially in the case of cordons and bushes of Apples on the *Paradise stock* which are lifted every few years. At Syon, watering and mulching were both much needed early in the present summer. I believe that mulching is our sheet-anchor in fruit-culture on the light soils of the Thames valley, for but few gardeners could afford the labour necessary to efficiently afford water to their fruit trees without it. Certainly we could not; and not only is it wanted by trees of all kinds in the open quarters, but by those on walls of every sort of aspect.

Cherries especially suffer from drought, and a timely application of water and a mulch do wonders for them, enabling the trees to retain their fruit and perfect it. The wider the space round a tree that is mulched the better for the tree; and in the case of trees on walls, the mulch should extend 3 to 5 feet.

Apricots, Peaches, and Nectarines, all of them worked on the free-rooting Plum stock, benefit more or less from a mulch over the roots, especially the Apricot, and growing as these do mostly on south and east walls, the resources of the roots are severely taxed in dry, hot weather. Old trees are benefited by mulches of half-decayed stable-manure laid on the soil 4 inches thick, the soil containing the roots being previously dressed with superphosphate of lime and nitrate of soda at the rate of 2 oz. to the square yard, and raked into the soil and water afforded to wash it in. It is a dressing that is good for most kinds of fruit-trees when they have become established. Failing these mineral manures, liquid from the stable cess-pit, and that from the cow-stalls, as well as the solid excrement, are excellent for dry soils. The latter should be partly decayed before being made use of. It is now too late to apply mulches to Raspberries and bush-fruits, these being best afforded in June or even earlier, the exact time being a matter of weather. The Raspberry requires, or at least is benefited by a dressing of farmyard-dung as a mulch, weak and superfluous suckers being first pulled up.

We all know and value mulches for the Strawberry beds, and they usually consist of clean straw, or that which a few showers of rain will render clean and sweet; and a mulch should be put to Strawberries before the blooms expand, so as to afford the necessary time to bleach and cleanse it. G. Wythe.

NURSERY NOTES.

WARRISTON NURSERY, EDINBURGH.

SITUATED in Inverleith Row, opposite the Royal Botanic Garden, the Warriston Nursery of Messrs. Thomas Methven & Sons is of easy access from any part of the city of Edinburgh, the cable tramcar from the Mound, in the middle of Princes Street, passing the gate of the nursery every five minutes. Horticulturists who may find themselves in Edinburgh during their holidays should make it a point to include a visit to this nursery, as well as to the Botanic Garden (which is always interesting, and is at present undergoing a thorough renovation) in their programme. About fifteen minutes by cable-car from Princes Street, a couple of hours' time, and a few pence, will suffice to do both places; although a long day might be profitably spent in the inspection of the special features and numerous objects of interest to horticulturists to be seen in them.

In a recent visit to Warriston Nursery, which we had not seen for some years, we found that Messrs. Methven & Sons had in the interval carried out great improvements for facilitating business, and added largely to the number and extent of the glass-houses devoted to the growing of plants and flowers for the regular supply of their customers, and for meeting the demands of their extensive plant and floral-decoration business, in which, under the skilful direction of their able manager, Mr. Alex. Mackenzie, they have acquired great celebrity. We had the good fortune on our visit to have Mr. Mackenzie for our cicerone, which gave a double value to the time we spent in walking through this interesting nursery, and discussing the various points of cultivation and taste with such a consummate master of both. Skilful selection of the best of everything for the special object in view, high cultivation on the most approved principles, and systematic order everywhere, were evidently the strong points in Mr. Mackenzie's successful management of the large and varied nursery and decorative stock under his charge.

TREES AND SHRUBS.

On entering the gate, the borders of the main walk, about 12 feet wide, are seen to be filled with the choicest varieties of ornamental trees and shrubs, many of them handsome specimens of considerable size, and well suited for immediate effect. This is especially the case with many carefully-trained specimens of *Golden Queen* and *Milkmaid Hollies*, as well as others of that useful family, and of the more ornamental kinds of *Conifers*. The golden variegated varieties of *Conifers* assume their richest tints of foliage in the soft, sandy loam of the nursery; and well-trained specimens of the *Golden Yew*, the *Golden Lawson's Cypress*, and the *Golden Retinosporas*, are perfect model plants of golden hue for the decoration of the front gardens of suburban villas, and the pleasure-grounds of the more aristocratic country mansions. In the well-arranged divisions of the nursery a fine, healthy stock of plants of a useful size, and of the best varieties for ornamental purposes, are grown in their hundreds or thousands, as the case may be, all carefully tended and frequently transplanted, to insure compact and well-rooted plants that will move with perfect safety to any distance and thrive well afterwards under all ordinary conditions.

THE GLASSHOUSES.

It is, however, inside the ranges of glasshouses at the present time that the visitor will be most struck by the vigour of the large and varied stock, and the excellence of the methods of its cultivation. One range is filled with young Vines struck from eyes in the usual way early last spring, and now, July, many feet in length, and of a thickness of stem, an

ly, short-jointed habit, more than commensurate their length. As "fruiters" and "planters" it did not be easy to match them, every leaf perfect, the growth robust and firm. An adjoining range filled with a great variety of the best decorative plants of Palms, among which the graceful forms of Kentias predominated. The plants vary in size from the year's seedling to well-furnished specimens of 15 feet in height, with every leaf fresh and erect; plants of great value for carrying out, with best effect, the floral decorations at Court functions at Holyrood, and at other places on important

white Azalea narcissiflora there is here perhaps the finest stock in the country, every plant stocky and well grown, and bristling with buds, which will give a rare crop of flowers in the early winter. It is almost needless to add that Mr. Mackenzie grows and flowers to perfection a splendid stock of Chrysanthemums, his skill in that branch of the business being in prominent evidence at the Chrysanthemum show held annually in the Waverley Market.

Stove Plants.—In a span-roofed range mainly devoted to the cultivation of stove plants for decorative purposes, those grown for table decoration were

more brilliant hues of the leaves of other subjects. The chief aim in growing these foliage plants for table is to have every leaf perfect, the plants freely grown to assume a light graceful habit, and the colours brought out in their greatest brilliancy; and these points are admirably obtained by the methods adopted by Mr. Mackenzie. Similar well-considered methods are employed in the culture of every class of plants grown in the nursery; and in the course of a visit to it, every observant gardener, whether employed in a private establishment or in the commercial branches, will not fail to pick up an idea or two worth remembering. *Visitor, July 31.*

MESSRS. JOHN COWAN & CO., LTD.

With a view to having greater facilities for coping with an increasing business, Messrs. J. Cowan & Co., Ltd., have decided to transfer their chief offices, and ultimately their entire business, from Garston to a branch establishment at Gateacre, which is some six miles in an easterly direction (Garston being south) of Liverpool, where, with charming rural surroundings, mild and salubrious atmosphere, and ample railway facilities for making the establishment readily and easily accessible from all parts, it was considered advisable to betake themselves. For the cultivation of Orchids, always a specialty of the firm, spacious new glasshouses, containing every improvement, have been erected. As a fitting inauguration, Messrs. Cowan purchased a few days ago the entire Orchid collection of Dr. J. R. Jessop, Roundhay Mount, Leeds, removing the plants to Gateacre, where they now occupy two of the new houses. This collection has been often noticed in the pages of the *Gardeners' Chronicle* and other journals, and was admittedly one of the most select collections in Yorkshire. It is intended to further extend building operations, and make suitable provision for importations of Orchids from both known and new sources. The nurseries, which are about 20 acres in extent, contain good collections of fruit trees, Conifers, and other evergreen and deciduous trees and shrubs. *J. I.*

THE NEW NOMENCLATURE OF PLANTS.

THE attempted enforcement on the gardener of new names for plants meets with the same kind of opposition in Germany as is dealt out to it in this country, and for the same reason that almost any kind of name is suitable for a plant, for the truth of which we refer to the often uncooth complimentary names given originally to plants, and which having got into all kinds of gardening books, are not likely to be readily ousted by others. In Germany, one supporter of the old nomenclature throws ridicule in this fashion on the would-be innovators. Last summer I visited my old friend, Andréas. He is a nice dear gentleman, and a great gardening amateur, interesting himself in everything that appears on the surface of the soil, knows every weed, and his entire collection of garden plants is neatly and prettily labelled. One always learns something from Andréas, and he is constantly "on the go." I had not seen the good gentleman for a long time, and I was filled with expectation regarding his latest discoveries. As might be expected, his little garden gave one pleasing impressions. "Hast thou newly-labelled everything?" I inquired of him. With joyful satisfaction he assented. "One must go with the times, and I could not do other than give my plants names according to the most modern views." "I am curious," said I, "in what these modern views consist." "Will soon show you," said he. A large group of Laburnum crowded with blossoms, stood out brilliantly against a background of dark green. "Last year," said Andréas, "every blossom was frozen; but this year my group of Laburnum Laburnum, Voss, has rewarded me two-fold; also the Caragana caragana, Karst, leaves nothing to be wished for. Some time the group was bordered with the small Anelanchier Anelanchier, Voss, but these getting too tall for me, I have substituted the variegated Symphoricarpos symphoricarpos, Voss." "Very neat," I replied, "but it is not necessary for you to repeat each name, my

MR. HARRY TURNER.

A distinguished prize-winner at the General Horticultural Exhibition, Hamburg. (See p. 109.)

sions, which Mr. Mackenzie executes with his known taste and skill. Scarcely any graceful or brightly coloured foliage plant comes to Mr. Mackenzie in carrying out plantations, but a few of his special favourites, beside Palms, and all graceful habited Ferns are well filled specimens, of all sizes, of Ruonymus m'cos latifolius variegatus, Eurya latifolia variegata, agnus glaber aurea, Rhopal'a coreocaden-is, and villea robusta among greenhouse foliaged plants, a regal and zonal Pelargoniums, select Fuchias, huge-flowered Hydrangeas in summer, and an Azaleas, and the choicest flowering plants ad through the winter and spring. Of the early

excellent in freshness, graceful habit, and bright coloring. The Crotons, of which angustifolius, Cheloni, Disraeli Earl of Derby, elegantissimus, and Weismanni are grown in greatest numbers as the best for table purposes—were each fit for a place on a competition table; and the same might be said of the beautifully coloured Dracenas, the old varieties, Cooperi and terminalis, still holding their own in graceful habit and brilliancy of colouring among many other charming newer varieties. Pandanus Veitchii, Dracena Lindenii, and Ficus elastica variegata, as well as Eulalia japonica, are grown in quantity, and well grown too, for the beautifully contrasting effect of their silvery-white foliage, when combined with the

memory is quite good." A pleasant glance in my friend's eyes, "Man, don't feel yourself insulted, that is the newest nomenclature. Instead of *Laburnum vulgare* or *Cytisus Laburnum*, we now say *Laburnum Laburnum*. *Caragana arborescens* is antique, as are likewise *Amelanchier vulgaris* or *ovalis*, and *Symphoricarpos* *Symphoricarpos* sounds quite as well, at the least as *Symphoricarpos orbiculatus*, doesn't it?" "Not quite sure," I remark. Still another nest of caterpillars. "One may search for them every day, and not find the last one," said Andr  es, taking a nest from a small half-standard Apple-tree. "It is now called *Malus malus*! But, Andr  es, that is enormously simple; and it would be still more so were we to adopt the arithmetical method, and say '+12'. The labelling would also be more simple; for instance, instead of thine *Larix Larix*, thou wouldst simply write *Larix2*; or in place of *Cedrus Cedrus*, Voss, *Cedrus2*, Castanea2, Catalpa2, *Cotoneaster2*, *Diervilla2*, and so on." My friend Andr  es made a wry face, saying that people should not make jokes about science. I was not yet certain which of us was right. We approached a small rock-garden, on which I espied a charming clump of *Edelweiss*. "I am proud of that," said Andr  es; "I collected the seeds of *Leontopodium Leontopodium*, Karst, on the Alps." He stepped forward and said, "That charming plant, the Beech Fern, *Phegopteris Phegopteris*, Voss, I brought as a living plant from the Hartz Mountains. *Filipendula Filipendula* comes also from there." "Ach so! thou meanest that *Spirea Filipendula*, L.," I remarked. Andr  es looking sideways at me as much as to say, "There is another fossil, a century behind the times, at the least."

The entire garden was filled with the new names. *Apios Apios*, Voss (*Apios tuberosa*, Much.), was climbing there; *Aruncus Aruncus*, Karst. (*Aruncus silvester*, Kostel, and *Spirea Aruncus*, Lin.), gave beauty to the vicinity of the fountain. *Cymbalaria Cymbalaria*, Wettst. (*Linaria Cymbalaria*, Mill.), clambered vigorously over a low wall; and *Linaria Linaria*, Wettst. (*Linaria vulgaris*, L.), was showing its first blossoms. There were further *Muscari Muscari*, Voss, *Viscaria Viscaria*, Voss, *Omphalodes Omphalodes*, Voss, *Polygonatum Polygonatum*, *Foniculum foniculum*, *Glaucium Glaucium*, *Pentstemon Pentstemon*, *Pulsatilla Pulsatilla*, *Hepatica Hepatica*, *Lagenaria Lagenaria*, *Dracunculus Dracunculus*, and a lot more well-known plants, which were growing not a whit better under their new names as under their universally-known names.

As my friend Andr  es was proceeding to make me acquainted with still more of these old plants, I strongly objected. I was fatigued and thirsty. "Can I offer you anything? Shall it be double K  mmel?" "But Andr  es, look at the consequence. That is now K  mmel K  mmel," said I, shyly. "Make no more stale jokes. I cannot set a bowl of *Ananas Ananas* before you."

We seated ourselves in a shady summer-house surrounded by a group of pot-plants, and I rejoiced that no bad consequences had happened to my old friend from the new plant nomenclature, and I believed we should hear no more about it. But that was not to be, for Andr  es brought up *Adhatoda Adhatoda*, *Malvaviscus Malvaviscus*, *Opuntia Opuntia*, and lastly, the old fruitful *Eugenia Ugni*, which he had newly labelled *Ugni Ugni*, Voss.

"Say no more, Andr  es," I remarked; "I will have none of it." "But it is the most modern, and, at the least, you will allow that these new names rest on scientific basis." In every way Andr  es tried to make the matter clear, and after I had digested a whole series of nomenclature laws, said I to friend Andr  es, "There lately fell into my hands an old Herbal by the worthy Brunfels, who wrote 'Ware nit unrecht wenn man die alten namen auch hett lassen bleiben, sintemal so man einen bekannten menschen, darin er getauft, verwandelt, wird er unbekannt, also auch mit den Krautern';" which we may render thus, "No harm is done if we let the old names remain; but if you change the name a man was christened under, you render him unrecognisable, so also with plants." I see no use in horticulture for the new names. The public does not understand us. In science there may be

some grounds for the system, but you will agree with me that horticulture in many questions of nomenclature should be allowed to go its own way, especially when we are requested to give up old well-established names. W. Monkmeier, *Botanic Garden Inspector*, Leipzig, in "*M  ller's Deutsche G  rtner*" for May, 1897.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By G. H. MAVCOCK, Gardener, Luton Hoo Park, Luton.

Souvenir de la Malmaison Carnations.—The rooted layers should now be potted, the strongest going into their flowering-pots, namely, 7-inch ones, and the weaker into 4½-inch pots, to be shifted once later in the year. A mixture consisting of ½ good loam, ¼ of peat, and ¼ of charcoal, sand, and soot thoroughly mixed together, will suit them very well. The soil should be made moderately firm with a rammer, being careful not to bruise the roots. If the potting-soil is somewhat moist, water will not be required for some days after potting; and when it is afforded, it should be sufficient, then and at all other times to permeate every part, frequent watering being very injurious to this variety. After the layers are potted, stand them on a floor of coal-ashes near to the glass in a low, span-roofed house, affording a light shading for the first week or two; then gradually accustoming them to full sunshine, and admitting more and more air as the root-action increases, not allowing the house at any time to become stuffy.

The Stove.—The shoots of *Dipladenia*, *Stephanotis*, and *Aristolochia elegans* should be laid-in regularly, and the plants well supplied with water at the roots, and not allowed to suffer from injurious insects, but vaporising the house occasionally. The dead sphagnum-moss on the surface of pots in which *Anthuriums* are growing, should be replaced with living moss. *Codineums* (*Crotons*) and *Drac  nas* which have become unduly large or lanky, may be tongued and treated as described on p. 22, vol. xxi. of the *Gardeners' Chronicle*. When rooted, the tops make useful plants for early work next spring.

General Work.—Let the supply of water be gradually withheld from *Achimenes*, *Gloxinias*, and *Gesneras* which have passed out of bloom, and remove the plants from the show-house to a dry pit. Plants of *Euphorbia* (*Poinsettia*) *pulcherrima* and *Euphorbia jacquini  flora*, if growing strongly, may be afforded liquid-manure water occasionally, and a moist-growing temperature, plying the syringe gently amongst them on the afternoon of days that are fine, fumigating the house or pit whenever aphides are observed, and rubbing off with the thumb and finger the brown scale insect as soon as seen. Cuttings of half-ripened wood may now be taken of the show and fancy *Pelargoniums*, and rooted in pots in a cold frame, or under hand-lights, affording water sparingly to them till rooted.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Ledbury.

Peaches and Nectarines.—Where fruit is ripening, the house should receive ample ventilation in hot weather, or the fruit will scald on the sunny-side. If the fruit has to be sent a distance from home, gather it with a pair of blunt-ended Grape-scissors as soon as the pulp begins to soften round the stalk; but if it be for home use, leave them on the tree as long as it is possible to do so safely, thereby insuring the proper degree of flavour. Do not let leaves and laterals shade the fruit, frequently going over the trees, to carry out the needful operation of removing or pushing out of the way the offending leaves, &c.

Later Trees.—The application of water to the borders, also morning and evening syringing, are now very necessary operations, and where old trees are carrying numerous fruits, liberal waterings of manure-water, or a sprinkling of fish-manure, will prove very helpful in enabling them to mature fruits of good size. Shoots of use for fruiting another year must be tied-in, and only such, cutting out all useless laterals, and do not crowd the shoots so that the leaves overlap. Mice are troublesome at this season, especially the large brown field-mice, which may be trapped in a fig-4 trap, baited with the kernel of a Filbert. Syringe the trees night and morning from which the crop of fruit is removed, and afford full ventilation.

The Pine Stove.—The time is approaching when rearranging the house and repotting must be carried out; and the present is a good season to prepare for

these jobs, by getting a compost mixed and put under cover in readiness, and getting pots and crocks washed, and the pots crocked. If the smooth Cayenne Pine is largely grown for winter use, the plants will be pushing or have pushed up the flower spike, and Queens being now nearly over for the season, the fruited smooth Cayenne may be moved into the fruiting house or division, keeping the forwardest fruits together at the warmer end, or where they may be readily got at for tying, &c. Afford the plants with swelling fruits weak manure-water occasionally, that is when they need water; keeping the walls, beds, &c., well damped down, and closing early in the afternoon, the temperature being allowed to reach 95° to 100°.

Successions.—These plants will mostly have ceased to grow, and when that is the case they may be kept a little drier at the roots and also overhead, but care should be taken not to go to the other extreme and allow them to get too dry. Afford air freely in fine weather, and discontinue to shade the plants. Any strong specimens that are still growing freely may be repotted, pots just large enough for them to fill with roots before winter being chosen.

Cucumbers.—Preparations should now be made for planting for winter-fruiting, as when these are planted early, and the trellis is well covered with foliage, it is an easier matter to keep up a good supply of fruits in the winter. Let the Cucumber-houses or pits be well washed with soft-soap after clearing the old beds, and lime-wash the walls, mixing some flowers-of-sulphur with it. Let the start be made with small mounds of rich rough compost, affording light top-dressings when the roots come to the light, but do not have large masses of compost, as these rapidly get sodden in the winter, it is then an impossibility to extract the moisture, and bring the soil into a healthy condition. Do not make use of any plant that has become starved and stunted, but only such as will get away at once. Rub off all fruits for a time, stopping the bine when needed, so as to get the trellis entirely covered with good bearing bina. Cucumber plants still in bearing must be cleared of spent leaves and weak shoots, and not allowed to carry large quantities of Cucumbers, nor allowed to become infested with insects. Afford them manure-water liberally, and a slight top-dressing of soil with a sprinkle of a suitable kind of artificial manure. These old Cucumber plants, when treated in the above manner, will often carry on the supply till the young ones commence to fruit.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

Making Plantations of Young Strawberry-plants.—The present is a suitable time in which to transplant young plants in rows 2 feet apart each way, making the soil quite firm about them in planting. The plants can be planted either singly or in triangular patches, allowing a space of 5 or 6 inches between each of the three plants thus set out in patches. For this purpose, good strong well-rooted runners should be used, and the land, as advised in a previous calendar, should have a liberal dressing of rich, decayed manure, trenched or deeply dug into it some time previously to allow of the whole settling down, the plants doing better in a firm than a loose soil. A layer of manure 2 inches thick should be laid between the plants, and then a good application of water afforded (in the absence of rain) to settle soil about the roots. Pinch out all runners that proceed from plants as soon as they appear, so as to direct the energies of the plants into the development of large crowns. The same remarks apply to Strawberries which may be growing in pots for forcing-purposes. These should be kept well-supplied with water at the roots, and with top-dressings of artificial-manure laid on immediately before applying clear water, weak liquid-manure alternating with clear water, in addition to the top-dressing.

Pruning Summer-bearing Raspberries.—The canes of last year's growth should be entirely removed now that the fruit-season is past, in order to make room for the canes of the current year, these being secured against wind-waving by running lines of tarred-string on each side of the rows, and fastened to stakes.

THE KITCHEN GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

Outdoor Tomatoes.—The plants will be making rapid progress, rendering it very necessary that the stem should be securely fastened to the wall, fence, or stout stake, as the case may be. The stems should now be stopped by pinching back to the first cluster of bloom, as any fruit set after this date will not ripen

in the open air. The side-shoots should be removed as fast as they appear, and if the leafage be very dense, a part of it may be cut off, so as to admit light. Liquid-manure may be freely afforded during dry weather.

Cabbage.—The beds of Cabbage in use should be kept clear of decaying leaves, and a heavy application of liquid-manure given, so as to force on the production of a second crop of heads. Large plantings should be made from the June sowings, putting out the plants in shallow drills, and affording plenty of water to settle the soil about them. This crop may be planted at 1 foot apart. The last sowing of Cabbage-seed should now be made for the season, and should the weather keep warm and conducive to late growth, this sowing will be the most certain to plant for the main crop of spring Cabbages; and on the contrary, if growth be hindered by unfavourable weather, plants from the July sowing will be the best, and most to be relied upon. The Cabbage-crop being in most gardens a very important one, it is well to bestow much care upon it. The land that has carried the crop of spring-sown Onions is that generally secured for the principal Cabbage bed; and though the application of manure is not always necessary or advisable, yet the land should be dug before planting it. For Cabbages of large or fairly large growth, the rows should be 2 feet apart, and the plants set out at 18 inches from one to the other; but for Cabbages of moderate size, such as Ellam's, Sutton's Flower of Spring, Wheeler's Imperial, &c., 18 inches between the rows, and a lesser distance from plant to plant, will suffice in most gardens. In some soils these smaller Cabbages attain large size, and the gardener must be guided by experience in the matter of space. A small bed may be planted on a warm border.

Work in General.—Clear off the land all rows of Peas which have gone out of bearing as soon as the pods are saved for seed purposes, if any, are ripe, the ground thus set free coming in for winter Spinach, &c. If, however, intercropping is practised, and Broccoli, Kale, &c., occupy the spaces, it is still important that the Peas be cleared away as soon as possible to prevent the drawing of the former, which need plenty of exposure to sunlight to enable them the better to withstand the inclemency of the winter. If Kale, Savoys, &c., are to occupy the space vacated by the Pea-rows, do not dig the land, but roughly hoe it deeply, and rake off the rubbish before planting it. For a Spinach bed, it may be necessary to dig the ground, but no manure should be employed. Turnips large enough to pull for use may be stored in a cool shed facing north, where they will keep longer in good condition than if left in the soil. Cauliflowers for storing under glass may yet be planted, also Coleworts.

THE ORCHID HOUSES.

By W. H. WAITE, Orchid Grower, Birtford, Dorking.

Intermediate-house.—The following species of *Sobralia* are deserving of cultivation for their showy if rather ephemeral blossoms, viz., *S. macrantha*, *S. m. splendens*, *S. xantholeuca*, *S. Lucasiana*, *S. Princess May*, *S. Warscewiczii*, *S. albviolacea*, *S. virginalis*, *S. liliastrium*, the pretty hybrid *S. Veitchi*, and *S. Kienastiana* (syn. with *S. macrantha alba*), a species with flowers of the purest white, and large. Many of these plants are in full bloom at the present time, and will continue to throw up young shoots and flower for some time longer. The plants require water at the roots rather abundantly, and being of vigorous growth they should not be stinted of pot-room, but those which have filled their pots with roots may be safely repotted after flowering. Large specimens which have become of an inconveniently large size, may be divided and repotted. Owing to the large quantities of water taken by these plants, the pots must be efficiently drained, crocks being placed over the bottom as is done, say, for *Chrysanthemum* or hard-wooded greenhouse plants, using as a compost lumpy fibrous peat, sandy-loam in a rough unsifted state, a small quantity of sphagnum-moss, and a moderate allowance of small crocks. After repotting, afford water carefully, not saturating the soil, but when a plant has become re-established it may be applied copiously. It is not always necessary to repot *Sobralias* as soon as they have filled their pots with roots, as by doing this they become large and unmanageable in a short space of time; but if in good health, afford them occasionally weak liquid cow-manure, and they will continue to thrive for several years without root disturbance.

Cymbidium.—In the same house plants of *Cymbidium Lowianum*, *C. L. viride* (concolor), *C. Lowie-eburneum* x, *C. eburneum Lowianum* x, *C. Hookerianum*, *C. Masterii*, *C. affine*, *C. Devonianum*, *C. eburneum*, *C. ensifolium*, *C. sinense*, *C. giganteum*, *C. Tracyanum*, and *C. longifolium* succeed admirably, for it is a fact that some of these species get into bad health by keeping them in high temperatures, and constant saturation of the materials is equally injurious. A cool, shady part of the house is the best place for them, and the compost should become moderately dry before water is afforded, it being a good sign of water being present when on application it rushes through the holes at the bottom of the pot. *Cymbidiums* in hot weather like the present are apt to be infested with red-spider, which quickly cause the foliage to take on a sickly hue; it is therefore very necessary to keep a sharp look-out for this pest. One advantage of having these plants in a group by themselves is, that they can then be heavily shaded in very bright weather.

Epidendrum Endressii is another Orchid to which red-spider is partial, requiring similar precautions, and sponging the under-side of the leaves. This Orchid should never be allowed to become dry at the root. There are a few species in the cool-house, such as *Odontoglossum grande*, *O. Schlieperianum*, *O. Insleyi* and its varieties *splendens* and *leopardinum*, which usually begin to grow at about this date, and the young growths catching and retaining water, they should be examined every day and the water poured out, otherwise these would soon decay. Any of the above-mentioned plants may now be repotted, using pots of small size, and three parts filled with crocks. After re-potting, place them in the warmest part of the house. *Odontoglossum Bictonense* and *O. Uro-Skinneri* now in bloom should not be afforded much water at the root; and *O. nebulosum*, being liable to rot from much moisture, and now beginning to make growth, is easily injured in the same manner. This species may now be repotted, the pseudo-bulbs being well raised above the top of the pot. The same applies to *Miltonia Warscewiczii* (*Odontoglossum Weltoni*), except that during the summer it should be placed in the cool house, removing it before winter sets in to one a few degrees warmer.

THE FLOWER GARDEN.

By CHARLES HERRIN, Gardener, Drogheda, Maidenhead.

Plants for Filling the Spring Beds.—If Wallflower-seed was sown two months ago, the seedlings will require to be pricked off into nursery-beds on the first opportunity, when the weather is cloudy or showery. During the drought, the necessity for affording water to the plants in the open is very considerable, and with the excessive heat it will be prudent to wait a short time in the hope of rain falling rather than run the risk of losing or seriously checking the plants. Last year's plants of *Myosotis* of kinds may be pulled to pieces, with or without roots, and dibbled in, 9 inches asunder, on a north or east border to make plants fit for going out in October, which they will do if duly looked after. Seedlings should be pricked out at a similar distance apart. Pansies and Violets will need to be well supplied with water during dry weather, and providing a change in the weather takes place shortly, old plants may be pulled to pieces, the points of the shoots cut off, and small rooted-pieces pricked out in the reserve-garden to furnish plants for autumn-planting. Primroses, *Polyanthus*, and Daisies may be similarly treated.

Seeds should now be sown of *Silene pendula* in variety; *Saponaria calabrica*, *Nemophila*, *Limnanthes Douglasii*, *Collinsia bicolor*, *Candytufts*, and *Godetias* in variety. The Brompton and Intermediate Stocks of various colours may also be sown in drills in the open border, the seedlings being potted-up when large enough. If the seeds of *Silene*, *Saponaria*, *Nemophila*, &c., be sown thinly in drills drawn at a distance of 10 inches apart, pricking them off does not really become necessary, and they may be removed to the flower-beds or borders in due course.

Propagation.—A start should be made forthwith with *Pelargoniums*, which have made this season a stiff but free growth, and the cuttings of which are fairly plentiful, and in a good state for striking. The earlier these are struck now, the fewer will be the losses in the winter. Cuttings of these plants strike freely in rather light soil on any sunny border, and they may be potted up or placed in boxes for the winter when rooted. The more general practice is to insert the cuttings in pots or boxes of sandy-loam,

and stand these in a sunny position. It is advisable to start with the variegated and golden-leaved varieties first, these being tenderer than others, and requiring to be rooted earlier. In the event of a change to rainy weather, the boxes or pots should be put in a cold pit or frame, with the lights placed over them, and well tilted at the back. If Pink-pippings are not yet made, no more time should be lost in inserting them in the manner previously advised. The layering of Carnations should also be attended to without delay. The propagation of other bedding subjects requiring alight bottom-heat, viz., *Iresines*, *Alternantheras*, *Heliotropes*, &c., may be deferred to the end of the month.

General Work will consist chiefly in maintaining tidiness everywhere, and affording water to suffering subjects, of which *Phloxes*, *Michaelmas Daisies*, *Heleniums*, *Sweet Peas*, *Roses* that will flower later, *Helianthus*, *Feins*, *Lobelia cardinalis*, *Gladiolus*, &c., will stand greatly in need. The carpet-bed plants will require much pinching and clipping to keep the outlines of the design clear. Lawns, where not regularly afforded water, will have become brown, and should not therefore be mown with a machine whilst the dry weather continues, but skimmed over with a scythe to cut off bents and grass-haulm.

THE APIARY.

By EXPERT.

Uniting Small Swarms.—Bees unite peaceably off combs by throwing them together, and allowing them to run into a clean empty skep or box. Therefore, if the bees of two swarms are to be united, drive both lots, and then put them together, afterwards running them into a hive as one swarm. To unite driven bees with stocks, sprinkle both lots with flour, and shake some of the bees off the combs upon those running in. Thus they are not only well dusted, but thoroughly mixed.

Foundation Sheets.—In the brood chamber always use full sheets; it is most economical. If half-sheets are used, the bees will almost be certain to finish the combs with drone-cells, which means an annual and heavy loss of honey, because, whenever there are drone-cells, the queen practises economy in laying eggs to produce drones, but this is not economy from the bee-keeper's point of view, as consumers of honey are greatly increased, while the desirable workers are decreased. The sheets of foundation, as sent out by manufacturers of appliances, just fit inside the frame, and when fastened in the saw-cut of the top bar, leave a space at the bottom, which the bees will fill with drone-cells. When the time for supering arrives, the shallow frames need not be quite filled with foundation, as the bees, during the time of plenty, are busy secreting wax, which, if not used in making combs, would be wasted. In these shallow frames there will, therefore, always be a good proportion of drone-comb, from which the queen must be kept by a sheet of queen excluder being placed upon the brood-frames.

How to take Honey without being Stung.—First lay it down as a rule that honey is not to be taken from the brood-combs, then there will not be much fear of stings. All surplus should be stored in frames or sections placed above the brood combs, and if brace-combs are prevented, by using an adapting-board and queen excluder, the taking of surplus honey is a simple matter—of course, supposing it is not left on till late in the season. When it is decided to remove a full super, have ready a super-clearer—that is, a board to fit the bottom of the super, in which there is fitted a bee-trap. Gently prise up one end of the crate, and puff in a little smoke, then raise it slightly off the hive, and place the board beneath it. If this operation is quickly and quietly performed, it will not take two minutes, and hardly a bee will take wing, and rarely one attempt to sting. In an hour, more or less, generally less, the bees will have passed through the trap to the brood-combs, and left the honey to be removed at the bee-keepers leisure.

How should Frames Hang?—As you like, in some hives frames hang parallel with, in others at right angles to the entrance. Which is the better? If you take the opinion of the majority, decidedly the latter, as the most practical men in England, on the Continent, and in America, use that style only. In America it would be a difficult matter to find any other kind of movable comb hive. I have no doubt the preference for frames running from front to back is due to the fact that supering arrangements are simplified, manipulation of a limited brood-chamber is rendered easy, and complications, even in the hands of a novice, are not as likely with the tiering as with the long hive.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, and as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept in a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

THURSDAY, AUG. 20	Swansea Horticultural Society's Show.
MONDAY, AUG. 16	Fellington-on-Tyne Horticultural (two days).
TUESDAY, AUG. 17	Bournemouth Horticultural.
WEDNESDAY, AUG. 18	Shrewsbury Horticultural Fête: Deputation of the Royal Horticultural Society. Trowbridge Horticultural.
THURSDAY, AUG. 19	Horsham Horticultural.
FRIDAY, AUG. 20	Devon and Exeter Horticultural Co-operative Exhibition at the Crystal Palace.

SALE.

FRIDAY, AUG. 20	Imported and Established Orchids at Protheroe and Morris' Rooms.
-----------------	--

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three years, at Chiswick. — 62°.

ACTUAL TEMPERATURES:—

LONDON.—August 11: Max., 71°; Min., 61°.

PROVINCES.—August 11 (6 P.M.): Max., 67°, at York Min., 57°, at Aberdeen.

WHATEVER may be the result of the great show to be held by the Shropshire Horticultural Society next week, it is certain that nothing that it can do in this way can confer upon the Society a title of the honour it has earned by the erection of a statue to DARWIN in the city near to which he was born, and where he was educated. We have often had occasion to point out and to lament the comparatively little value, so far as horticultural progress is concerned, of these exhibitions. We by no means under-estimate their value in certain ways, but it is clear that their influence on progress and development is very slight in proportion to the cost of time, labour, and money that they necessitate. We have not to discuss this matter now, our duty is to congratulate the Shropshire Horticultural Society on its enterprise, and to tender to its executive the cordial thanks of the horticultural community.

Old readers of the *Gardeners' Chronicle* will remember the interest DARWIN took in such matters as hybridisation, selection, and variation. They will remember his numerous contributions to the subject in our columns and elsewhere, and will have noted how modest he was with all his eagerness to obtain and diffuse information.

The two volumes on *The Variation of Animals and Plants under Domestication* teem with the facts supplied by horticulturists, not of numberless patient himself. He it was who of the older botanists

who looked askance at varieties and monstrosities, and had little sympathy with the patient labours of the florists. It was DARWIN who showed the immense importance to be attached to these variations, as affording evidence of the progressive development of plants and animals, and the causes which influenced them.

The general inferences from all these facts and observations were given to the world in the *Origin of Species*, published in 1859; but it was felt that it was necessary to supply the student with the facts upon which these inferences were drawn, and this requirement was fulfilled in the work on *The Variation of Domesticated Animals and Plants* before mentioned, a work which con-

natural science, placed the books under the of his impassioned oratory. Now, the general principle of evolution is universally admitted almost every department of human knowledge and a modern Bishop instead of binning it with becoming appropriateness spoken DARWIN as "one of the door-keepers of the vast temple of the universe who pointed to us new vistas, every one of them leading up to the throne of God."

Very appropriate also was the presence of Shrewsbury of Sir JOSEPH HOOKER, who, with HUXLEY, bore the brunt of the first attack. HOOKER has happily lived to see the once denounced doctrine universally accepted.

FIG. 30.—DARWIN'S STATUE.

(Erected by the Shropshire Horticultural Society.)

tains, up to the date of publication, the fullest general account we have on the variation of cultivated plants. That work is a veritable treasure-house of information on matters connected with the general principles on which horticultural practice was based.

It is curious for some of us to recall the exceeding bitterness with which DARWIN and his books were assailed at the time of publication. As DARWIN's single-minded love of truth, caution, freedom from dogmatic aggressiveness, and exceeding modesty became known, the absurdity of the charges brought against him became recognised; whilst his books have not only survived the attacks made upon them, but have become the text-books from which the new generation of naturalists have been educated. A bishop who was ignorant of

made the basis of study and research in departments of natural science.

The statue is in bronze, and is the work of Mr. MOUNTFORD, also a native of Shrewsbury. There is a great similarity in the pose of the figure to that of the fine statue in the hall of the Natural History Museum. For our illustration we are indebted to the kindness of the proprietors of *Knowledge*.

The Royal Botanic.

ON the ground that nothing concerning horticulture is without interest for us, we note the hopeful anticipations expressed at the annual meeting of the Royal Botanic Society, Regent Park. For years the Society has failed to live up to its title, and more attention has been paid to objects having little or no relation

FIG. 31.—STAIRCASE AT THE TOWN HALL, SHEFFIELD, ON THE OCCASION OF THE QUEEN'S VISIT. (SEE P. 109.)

than to science. Some excuse for this is afforded if financial success were the object, but it is not so, as frequent complaints are made of non-payment of prize-money or at least, of very long delays, and it is acknowledged at the meeting that the Society has a debt of £20,000!

Royal Horticultural Society, for only one period of its existence, followed a policy to that adopted by the Botanic Society, the result approaching total collapse. The policy was changed, a great improvement ensued, a fact of which we hope the Botanic will carefully take note. As to practical gardening, it appears, is in a state of confusion, with examinations and certificates, of value are certificates issued by such a body to be, unless it entirely changes its policy, and regains the respect of the horticultural community? The imitation is no longer to the horticultural Society, but to the Botanic, and we hope that the Botanic will not do that we do not want in London horticultural centres, and we hope that the Botanic will like competition in this matter. The two, the Royal Horticultural and the Royal Botanic Society, should be avoided as injurious to each. The renewal of the lease of the gardens is, so that there is some hope the garden may still have a useful life before it. It appears that the Woods and Forest Department, before acceding to the lease, required some assurance of the financial stability of the Society, and has been met by the raising of a guarantee fund, which is a practical, business-like, if rather unorthodox way of looking at matters. The chief object of such a Society has for the indulgence of the Government is surely not a matter of course; but depends on the record of the Society, or in the reasonable anticipation of the future, or in the provisions of the charter. The public will not object to being taxed for a useful or useful practical work; but will resent being asked to contribute to a garden that condescends to donkey-decorating and other entertainments—useful enough in their way, but beyond the province of a self-respecting, scientific society. There is no sort of reason to provide "Welcome Clubs" and other societies of various kinds, particularly if they are to pay for them; but, if they are to be, the Society should abandon its old name and get its title amended for one consistent with the objects it thinks fit to pursue.

COSSAGE AT THE SHEFFIELD TOWN HALL.—On the occasion of the visit of the Queen to Sheffield the newly-erected Town Hall was elaborately decorated with plants and flowers, an especially fine display being made on the grand staircase shown in our illustration, p. 107. Here were height, breadth, and the most seems to have been made of these by the floral decorators, Messrs. FISHER, of the Handsworth Nurseries, Sheffield, having a very satisfactory effect.

EXHIBITIONS AT HAMBURG.—At the recent International Exhibition held at Hamburg from August 3, the large Gold Staats Medal was awarded to Mr. CHARLES TURNER, Royal Botanic Garden, for 200 specimen Carnations in addition, an award of the large Gold Medal made for 250 varieties of cut Carnations, of each variety. An extra large Silver Medal also given for forty-eight blooms of dressed and a special prize of 500 marks for the display of Carnations in the whole exhibition. The cut blooms left London on the previous Saturday by the Hamburg mail and were landed at Hamburg on the

following Tuesday. The cut blooms left London on Wednesday evening, and reached Hamburg on Thursday evening, all arriving in excellent condition and very fresh. Such a performance establishes a record in Carnation exhibiting, and bears testimony to the spirited enterprise shown by the exhibitor. A portrait of Mr. H. Turner will be found on p. 103 of this issue.

NEW WINTER-GARDEN AT THE ANTWERP ZOOLOGICAL SOCIETY.—The "Palais des Fêtes" of this Society was inaugurated on July 26 by the King of the BELGIANS. Among the many sections composing the establishment, the Winter-garden must be mentioned—a fine building, but, if anything, too lofty. The future will show what can be done here with the plants. Meanwhile, I may mention some fine Palms and Tree Ferns. I would name, as important varieties, *Cocos Bonneti*, *C. chinensis*, *C. Weddelliana*, *Brahea Roezli*, probably the finest specimens in Europe; *Astrocaryum*, *Washingtonia robusta*, *Phoenix rupicola*, *Rhapis flabelliformis*, *Kentia Forsteriana*, *K. Moorei*, and other plants. I noticed *Cyathea medullaris*, *C. dealbata*, *Balanium antarcticum*, *Dicksonia squarrosa*, *Hemetelia Smithi*, *Alsophila paraguensis*, *Dicksonia Baptistei* (?), *Lomaria cycadifolia*, *Aralia elegantissima*, *Cycas revoluta*, and *Maranta zebra*. The arrangement of these plants is very successful. At the end of the garden is a fine grotto and fountain, and a rockery well

FIG. 32.—DARWIN'S BIRTHPLACE, THE MOUST, FRANKWELL, SHREWSBURY. (See p. 105.) (Taken from the Castle.)

stocked with plants, among them some pretty *Selaginellas*. To M. BLOCK is due the arrangement of this garden, and I would also mention in connection with it M. L. HOESTER, to whom much of the credit is due. *Ch. de B.*

AQUATIC PLANTS AT THE HAMBURG EXHIBITION.—An important section of this exhibition is that devoted to aquatic plants from warm regions, and grown in tanks fed with carefully-heated water. The Victoria regia has done well here, and one of its great leaves has been turned over to show its curious conformation. It is uncertain as yet whether the plant will bloom. There is also a fine collection of other water-plants, bog-plants, *Nymphaeaceae*, &c., mostly sent from the Hamburg Botanic Garden, some from the Brothers HARSTER, of Speyer-on-the Rhine. *Ch. de Bosschère.*

GREENHOUSE RHODODENDRONS.—Messrs. FISHER, SON & SIBBAY send us trusses of two new greenhouse Rhododendrons raised by them, which are of great beauty:—

Duchess of Portland has many-flowered trusses of rosy-pink flowers, with long white tubes. The tube is very slender, and measures about 45 mill. (1½ inch), expanding into a flat limb 35 to 40 mill., or about 1½ inch in diameter, with ovate lobes. Ten small globose green glands surround the base of the elongate cylindric ovary. The leaves are coriaceous,

ovate, oblong, tapering at each end with short thick petioles.

Duchess of Westminster has deep rose-coloured flowers, with relatively thick white tubes. The flower-tube 35 mill. (1½ inch) expands into a limb measuring about 5 cent. (2 inches) across, lobes broadly oblong, white-edged, and tipped with rose. The ovary is covered with scales, and surrounded at the base with ten greenish glands.

BORDER CARNATIONS.—Mr. JAMES CROMBIE, of Barrow-in-Furness, sends us several specimens of border Carnations remarkable for their free-flowering properties and vigorous habit. No. 1, labelled *Crimson-scarlet*, from its colour, is particularly noticeable; No. 4, "Terra-cotta," is buff, flaked with rose; No. 2, *Rose self*, is a well-shaped flower, of a lovely shade of rose. But it is impossible to particularise. It is enough to congratulate Mr. CROMBIE on the excellence of his strain.

HORTICULTURAL SCHOOL AT NAARDEN-BUSSUM, NEAR AMSTERDAM.—Our attention has been called to the training given to young men at the *Sempercrenses* Nurseries, which offer a good opportunity to young gentlemen desirous of learning horticulture, both practically and theoretically. The theory comprises:—Botany, botanical terminology, double book-keeping, commercial correspondence in Dutch, French, English and German, and landscape gardening. Fuller particulars on application to M. A. G. M. RICHARD or M. A. M. C. JONGKINDT CONINCK.

EXAMINATION ANSWERS.—In our last issue we gave some characteristic examples of what may be expected when candidates come forward without an idea of what is expected of them. Here is another sample, taken from the answers of a candidate desirous of obtaining a garden appointment:—"In some plants whose flowers have a flora tube the stamens are called Thrummide, or Pinnide, according as the anthers are below or above the upper end of the tube."

MESSRS. WM. FELL & CO. OF HEXHAM.—On Thursday, the employees of this firm of seedsmen and nurserymen were treated to a trip to the town of Berwick-on-Tweed, starting at an early hour in the morning from the town. Over sixty persons of both sexes participated in the trip.

ABBAY PARK FLOWER SHOW, LEICESTER.—An interesting event in connection with the Abbey Park Show last week, was the presentation of a valuable gold watch and chain to Mrs. J. BURN, wife of the much esteemed curator, in appreciation of her great attention and kindness to the horticultural exhibitors and friends. The presentation was made by Mr. ALFRED OUTRAM, F.R.H.S., who has acted as one of the judges since the commencement of their annual shows, now twelve years since. The presentation came as an agreeable surprise to the lady.

THE LONGEVITY OF SEEDS.—M. CHARLES NAUDIN contributes to the *Bulletin* of the Société Nationale d'Acclimatation de France a paper on "The Longevity of Seeds, and their Preservation in the Earth." Seeds, says he, are known to remain for an indefinite length of time, even for several centuries, in the ground without germinating, owing to atmospheric or other causes. M. NAUDIN instances, as a case of suspended germination, a packet of earth from the Sahara, which, spread over a flower-bed, and duly watered, was found to contain seeds of *Helianthemum*, which grew, and bore yellow flowers. The inference is, that an apparently barren region yet contains in its soil seeds which, were the climate to become more humid, would rapidly transform it to one of vegetable fertility and luxuriance. M. NAUDIN mentions, in further confirmation of his opinions, that in 1895 he received a few seeds from Gaboon packed in some of the soil of that place. This earth, less than two pounds in weight, was placed in a flower-pot, whence, in a fortnight, sprang twenty seedlings all belonging to the *Cucurbitaceae*. The stems and branches of these

... from 20 to 24 feet, and it is supposed that soil more carefully selected would give still richer results. In the many cases where plants cannot be brought to Europe in good order, where they die on the voyage, or are immature at their prime, it is suggested that a sample of the earth selected from some likely spot in their vicinity should be sent over in their stead, and might be found to contain fertile seeds of the species desired. If this, says M. NAUDIN, seems a proceeding based too much upon chance, like that of a fisher casting his net at a venture, this difference may be pleaded: the botanical collector is no more sure of finding what he seeks, but in all probability will obtain something new and acceptable. Finally, it must always be borne in mind how easily packets of earth can be transported from place to place without any attention on the journey.

MR. ALFRED SUTTON, J.P., OF GREENLANDS, READING, passed away on Saturday, August 7, at the ripe age of seventy-nine years. Mr. ALFRED SUTTON especially interested himself in floriculture and the "home" part of the work, whilst his brother was more particularly connected with the agricultural and seed-growing departments. Though naturally taking an interest in the affairs of his native town, Mr. SUTTON did not serve the town on the Town Council, his retiring disposition disposing him to refrain from public work. He, however, took the deepest interest in education, being a member of the School Board for fifteen years from its formation, when he was elected at the head of the poll. He was a warm supporter of missionary work, both at home and abroad, especially the Church Missionary Society. At the present time three sons are working as medical-missionaries in Quetta, Bagdad, and South Africa respectively. In fact, all religious movements, especially those established for the benefit of young men, were dear to him. He was one of the founders and chief supporters of the Reading Church of England Young Men's Christian Association. Three mission rooms, in populous districts of the town, were erected by him; also the coffee-house known as the "British Workman." He was a liberal subscriber to philanthropic societies, and was for many years a member of the Board of Management of the Royal Berkshire Hospital. His wife and ten children (seven sons and three daughters) survive him. Both Mr. ALFRED SUTTON, and Mr. MARTIN HOPE SUTTON, his elder brother, who founded the firm and who survives him, retired from business more than nine years ago (May 31, 1888), and they have no capital or other financial interest in the firm of SUTTON & SONS, which business they then made over to their sons, the present partners.

STOCK-TAKING: JULY.—Judging by the crowd at the counter of the Queen's Printers on publication-day, there must be an extensive demand for the Monthly Returns issued by the Board of Trade, and so one might imagine an effort would be made to have these issued without fail on a certain day in each month. Well, it might have been the excessive heat, or the Bank Holiday, but whatever was the cause, nearly a third of the month of August had passed away before the authorities issued the Returns for July. Since our last report the new American Tariff has become law, the German and Belgian Commercial Treaties have been "denounced," gold has broken out in a good many spots.

British Columbia, a great lock out and strike has come to pass at our own doors, and the weather notwithstanding, things political and social have taken quite a lively turn. Fortunately, here we have nothing to do with these things, though each and all of them have had—and will continue doubtless to have—an influence on British commerce and manufactures. Taking up the tale as told in the Returns, we find that the imports for July amount to £36,123,523, against £34,378,158 for the same period last year, or an increase of £1,745,365. A decrease is noted in four of the

sections, as follows:—Articles of food and drink dutiable, £101,256; tobacco, £116,905; chemicals, &c., £103,778; manufactured articles, £7845; miscellaneous articles, £115,110. The highest increase is that in raw materials for sundry industries and manufactures—£879,077. The following is our usual extract from the "summary" table:—

IMPORTS.	1896.	1897.	Difference.
Total value ...	£ 34,378,158	£ 36,123,523	+1,745,365
(A.) Articles of food and drink—duty free ...	11,867,615	12,443,071	+585,456
(B.) Articles of food and drink—dutiable ...	2,085,831	1,984,575	-101,256
Raw materials for textile manufactures ...	2,796,693	3,004,993	+208,300
Raw materials for sundry industries and manufactures ...	5,106,149	5,985,224	+879,077
(A.) Miscellaneous articles ...	1,164,810	1,049,700	-115,110
(B.) Parcel Post ...	66,504	15,469	-43,965

It is worthy of note that the total increase for the past seven months amounts to £10,681,073. Very striking indeed, and suggestive, are the figures relating to the imports of fruits and vegetables, which are as follows:—

IMPORTS.	1896.	1897.	Difference.
Fruits, raw:—			
Apples ... bush	103,252	68,444	-34,788
Cherries ... "	90,166	92,122	+1,956
Plums ... "	138,023	231,316	+93,293
Pears ... "	78,523	114,167	+35,644
Grapes ... "	20,770	167,529	+146,759
Unenumerated ... "	246,200	398,156	+151,956
Onions ... "	335,591	415,677	+80,085
Potatoes ... cwt.	109,811	409,332	+299,521
Vegetables, raw, unenumerated ... value	£194,618	£193,621	-£1,027

It would be waste of time and space to dilate on the "differences" noted—they carry their own lesson. In noticing the

EXPORTS FOR JULY,

the belief may be referred to, that capital will be solicited by our Canadian brethren for the developing of enterprise in that vast land, in the growth of which we are all interested; and it may not be inopportune to state that a belief is gaining ground amongst us that the Canadian bankruptcy laws require overhauling, and generally bringing up-to-date. Both the High Commissioner and the Premier are invited to give a glance at the subject, and soon. The figures relating to the exports foot up at £21,359,139 for July, 1896, against £21,501,452 for last month—or a gain of £142,313; but troubles at home and abroad have to be blamed. Still, we must be thankful for the increase, small though it be, in view of the fact that the decrease on the seven months amounts to over a million and a half sterling. There is one special decrease to be noted in the month's values—that of £965,491 in the section "Articles Manufactured and partly Manufactured"—viz., yarns and textile fabrics; the biggest increase is £683,077. Exports of food show an increase of £120,029. The total for the seven months shows a decrease of exactly £1,592,975.

HOME CORRESPONDENCE.

SOIL AND THE DISEASES OF POT PLANTS.—Is not the "gardener in a hurry" responsible for many of the evils that accompany and afflict most grievously modern plant culture? Instead of obtaining his store of loam and peat a year or two before he requires to use them as potting material or for forming beds for Melons, Cucumbers, Tomatoes, Eucharis, Gardenias, Mushrooms, &c., the soils are carted in from the field or the moor, and with little or no previous mellowing in stack are employed, together with all the injurious spawn of fungus of various species, chrysalids, and grubs and eggs of insects, live roach and seeds of noxious plants capable of germinating, remaining in them. Is it a matter for wonder that the plants suffer at the root or top? When the writer of this note was a worker in a garden, one of the first jobs he was put to was the stacking of the loam. This was brought in from a strip of pasture at the south side of a cliff where the sheep and other kinds of farm stock delighted to find shelter from the bitter east and north winds of a northern maritime county. The soil was a strongish yellow loam, well saturated with the excrements of the animals, and, as a consequence, it was permeated with the roots of grasses and other plants. This soil was put into rectangular stacks about 5 feet wide and high, finished off with a peaked top, in order to cast off the rain to some extent. As the work of digging and stacking took place in open weather during the winter, the sods were usually moist throughout, and the heap, therefore, maintained its moisture to a certain extent for a year or longer. The turves were put together, grass and all, quite regularly, like brickwork; and when the building of a stack was finished, the sides were neatly shaved off with a hay-knife or sharp spade. The grass and the roots soon set up slight fermentation, engendering warmth in the stack, and brought about two things—the decay of the roots and the herbage, destroying most of the injurious insects, their eggs, and pupae; and those in which which survived the heat and the deprivation of air soon succumbed to starvation, for it was an article of faith with the head gardener not to permit living plants to exist on the sides or tops of the stacks, these being shaved off occasionally, and the shavings tucked into a hole made in one of the sides or at the top, and afterwards covered with sods. The writer has no recollection of noticing any of these diseases attacking either plants indoors or out, of which we hear so much at the present day, and he is of the opinion that they would be much less common if more care were taken in the preparation of the soil. Similar care was taken of all sorts of peat in use, only it was left longer in stack before being used for any purpose, unless it was when employed as a top-dressing, or an addition to the staple in planting American plants in the open air, for which purpose partially-decayed peat is to be preferred to that which is over-much decayed, much more sand can be used with it. Leaf-mould we really what its name implies, and not a partly-rotten lot of leaves. Pure leaf-mould, if kept on an elevated spot of ground on the north side of a wall, and when well decayed, that is in about three years, and protected from rain and snow, contains nothing that is inimical to plant life, but much that is particularly suitable as the food of plants. The same cannot, however, be said of that which is partially decayed, which may often contain the mycelium (spawn) of various dangerous saprophytic fungi, &c. of insects, &c. *Northerner*.

LILIAM LONGIFLORUM HARRISON—Your Clivedon illustration of this beautiful Lily reminds me of the singular beauty produced by it just recently in the garden of Stanmore, Kew Road, Richmond, where there was a long, thickly-planted row of it, and every plant in full bloom. Instead, however, of being drawn under glass, some 3 feet in height, the Stanmore

Lilies were but 20 inches in height. None the less, the flowers were of the finest and purest. The bulbs were planted in the spring in ordinary garden soil; they will be lifted when thoroughly ripe, and doubtless will produce as fine an effect next year. I had the exceeding pleasure a few evenings since, when calling at Stanmore to enquire after the welfare of one whom all who know him so much respect, and have so much missed, Mr. H. Herbet. I was rejoiced to find him out walking in his garden, though still in a very weak and much-suffering condition, yet happily much better than at any time since his attack of illness, several weeks ago. It was with some emotion, as we sat in his verandah and looked out upon the garden with the beautiful white, sweet Lilies in the foreground, I learned from him how much of pleasure he had been enabled to obtain from sitting quietly alone, and, as it were, holding communion with his flowers; for if not in language, at least in imagination, one seemed to hold converse with the other. What a delightful frame of mind is it which thus enables those who are afflicted still to obtain such happiness from their gardens and flowers! A. D.

THE SEEDING OF NARCISSUS.—A correspondent who made an enquiry concerning the seeding of Narcissus, will probably be glad to know that the seeding of many Narcissi is largely a matter of climate and soil, as well as of season. Cernuus seeds as freely as most white trumpets, all of which are somewhat shy and uncertain; Albicans might also be tried—in the writer's garden it produces seed with fair regularity. Few, if any, of the medio-coronates with high colour can be depended upon for seed, though many have efficient pollen, e.g., C. J. Beckhouse. But "Narcissus" will have to plant a variety of Narcissi, and observe the effect of his local conditions upon their fertility. Moreover, the parents (seed and pollen) which in theory should yield the finest seedlings, do not always do so in fact, as he will discover. Seedlings from the Narcissi which are finest in form and colour, commonly revert to inferior types; nothing but much experience will show the best elements to work with. G. H. E.

CROSS-BILLS.—I never remember at this season of the year such a visitation of strangers. A large family of cross-bills have taken possession of the tops of my Scotch Firs, and the havoc they make with the cones may be imagined, when I tell you that a full bushel of cones were picked up under one tree, the result of, I believe, only two days' feeding. Many of the cones seem to be dropped before they had opened them. Is this unusual? Charles Noble, Bagshot.

FRUIT-CULTURE.—I scarcely think that we can attribute (as a pleasant writer upon fruit-growing seems to do in your last issue) the sad failure of the fruit-crops this year to defects in cultivation. Cultivation, in all likelihood, has been the cause as usual; perhaps, upon the whole, improving, through the good advice of the many, who write about it, without trying it. But where is the fruit-crop? Gone—as it so often loves to be—to the happy land of promise. After forty years of gentle hope and humble vigilance over some 12 acres of fruit trees (planted and managed by myself), perhaps I may be allowed to offer a hesitant opinion about the very frequent failure, even in the warmer parts of this country. The spring-frosts and the chilly weather of our April and our May are chiefly to be blamed, perhaps, for the regular disappointment. But to me it appears that the present barren season, like one or two which I have known before, should be attributed mainly to the rather unusual weather of last year. After a very long drought we were visited by a month of almost incessant rain, the wettest month I have recorded in the entries of more than thirty years. This month, unfortunately, was September, the very period when our fruit trees should be engaged in forming and maturing the buds of produce for the following season. Instead of doing that at leisure, they rushed almost with one accord, after so long famishing, into wild growth and rapid extension, such as they should have accomplished in the summer. The result being that the bloom-bud—if there is any truth in my idea—was slurred and scamped, instead of being concreted and solidified. It is true that there was a fine show of bloom this year; but it was not steadfast, not hard and strong, as I have seen it, especially in 1894. Being largely congratulated upon the magnificent crops in store for me, I was obliged to express ill-mannered doubts; and, alas! the pea was not under

the thimble, as the British fruit-grower so often finds. The weather of the blooming-time was not propitious, but I have known a fair crop after much sharper frosts than we were favoured with this spring. R. D. Blackmore.

VINE BORDERS, INSIDE, COVERED OVER WITH BRICKS.—Twice only have I met with these; in each case I was not favourably impressed with the system. The borders were rather flat, and the entire surface was closely paved. The bricks in one case were green with lichen, and had a disagreeable appearance, and on lifting up one or two of them the soil beneath was found to be in a soddened state. Whether success or failure followed the practice, I am unable to say, but in the second instance the gardener told me he was far from satisfied with the results, and should not carry out the practice further. It seemed as if a good dressing of manure would be more beneficial to the Vines than the moisture retained and the warmth imparted by the bricks. Moreover, were the borders open to the air, there would be less probability of the soil getting into a sour condition. H. Markham, Margate.

HOLLAND.

At Amsterdam I visited the Zoological Garden of the Society "Natura Artis Magistra," wherein are some excellent collections illustrative of birds indigenous to Holland. There is a good aquarium also. The plants at the Zoological Garden of Amsterdam are not very important, scientifically serving chiefly to ornament the garden in summer and the houses in winter.

M. M. Groenewegen & Co. have an important establishment with many plants well cultivated, and a large seed trade. At their printing office is issued the journal *Sempervirens*, edited by M. H. Witte of Leyden.

The Society "Corona" does a large business in indoor plants and flowers.

A well-known amateur grower is Mr. C. W. R. Scholten, Jun., who has a good collection of Orchids and a fine specimen of *Livistonia rotundifolia*.

Near the last-mentioned establishment is the phytopathological laboratory of Mr. Willie Commelin Scholten, under the direction of Dr. J. Ritzema-Bos, under whom its value has already been proved.

At the Amsterdam Botanic Garden are some fine specimen plants: notably, *Encephalartos longifolius*, supposed to be over 1000 years old, and blooming every twelve years; a fine *Ptychosperma elegans*; many very good *Encephalartos Altensteinii*, Palms, and Cycads; *Doryanthes excelsa*, about to flower; *Macrozamia Denisoni*, with a white stem; *Dracena Draco*, *Cinnamomum dulce*, *Scindapsus pertusus*, with long adventitious roots; and a fine *Dicksonia antarctica*. The cultivation is not so good as might be desired. Ch. De Boscchère.

VEGETABLES.

BUNYARD'S EXHIBITION BEAN.

SOME little confusion was recently created in the minds of the members of the Royal Horticultural Society's Fruit Committee, by the sending to Chiswick from Exeter of a Long-pod Bean called Exhibition Long-pod. This, when seen by the committee at Chiswick, was assumed, both by resemblance and name, to be the same as Bunyard's Exhibition, and a previous award to that variety was confirmed. At the ensuing meeting at the Drill Hall, a dish of the Exeter variety was brought to the table, when it was presented as distinct. Why the sender should have selected a title already recognised in commerce is inexplicable, and the committee was compelled to ask that both "Exhibitions" should be grown at Chiswick next year. I have seen the whole of the Maidstone stock growing on Mr. Bunyard's seed-farm, and there I had ample proof that the original Exhibition is a splendid variety, very true, and carrying pods in abundance of great length, filled closely with beans. A. D.

NEW PEAS FOR 1897.

Probably no kind of vegetable has had more attention bestowed on it than the Pea, and fine varieties are so abundant that one might almost suppose that perfection had been reached. However, several varieties have come before my notice, four of which came from a well-known London seedhouse, which, after giving them a fair trial and made full comparisons with fine well-known varieties, I must consider to be improvements. Early Forcing is a splendid Pea, very prolific, quick, and of excellent flavour; Springtide is a fine early, white Pea, having a height of about 4 feet; St. Oysth, a dwarf, early Pea, of fine quality and very prolific; and Early Morn, one of the finest Peas that has yet come under my notice, either for general use or exhibition. It is a dwarf, marrow-fat Pea, with handsome, well-filled pods. Edwin Beckett, Aldenham House Gardens, Elstree.

LETTUCES: BUNYARD'S PERFECTION WHITE CÖS, AND CENTENARY CABBAGE-LETTUCE.

I have had no experience with either of these two varieties as winter Lettuces, but I can speak favourably of them as summer varieties. Perfection makes a large heart, is self-folding, crisp, and sweet flavoured. Centenary under good cultivation becomes a fine, solid head, and is of the best quality, keeping in good condition for a long time after being full grown. With regard to the production of good Lettuces in dry weather, and on light land, there is no better plan than that advocated in the *Gardeners' Chronicle*, March 20, p. 181, viz., by sowing the seed where the plants are to stand to mature. As the writer of that paragraph justly remarks, there are many kinds of vegetable seeds which might be sown where the plants are to stand, thus avoiding the labour entailed by transplanting, which would prove highly beneficial to those left, the tap-root travelling in a downward direction in search of moisture, and the plants would therefore not be so liable to suffer in dry weather as are transplanted plants. The ground planted with Lettuces should be well mulched in dry weather with short manure, or short grass, &c., and thoroughly moistened with manure-water. In this garden the ground is shallow, and overlies chalk, rendering a mulching and heavy watering of paramount importance when sowing the seeds. Lettuce, like many other kinds of vegetables, should in the hot months be cut early in the morning, and laid in a cool, damp place till wanted, which is a better practice than cutting them after the sun has shone fiercely on them for some hours. H. Markham, Margate.

BOOK NOTICE.

POT-POURRI FROM A SURREY GARDEN. By Mrs. C. W. Earle, with an Appendix by Lady Constance Lytton. (Smith, Elder & Co.)

THIS is a very pleasant addition to the large number of popular gardening books which have been issued since the fashion was set by Mr. Bright's *Year in a Lancashire Garden*, as reprinted from these columns. Their value lies in the stimulating influence they exert, and in the pleasure they afford, so that they fulfil a very useful purpose. The title of the present volume is an apt one, for the book is really one *de omnibus rebus et quibusdam aliis*. The author gossips pleasantly about the flowers in her garden and in her boudoir, and then rambles off to discuss methods of cooking Potatoes and Saleafy, the right way of bringing up sons and daughters, and the appropriate mode of furnishing the house. She shows a quite unusual but not very discriminative knowledge of books new and old, and is somewhat dogmatic in the expression of her opinions. To believe that *Stoever's Life of Sir Charles Linnaeus* "is the only biography of him ever written," is to ignore Pulteney, Maton, Haller, Sir William Jardine, Agardh, Macgillivray, Fée, and the writers of numerous minor biographical sketches. A reference to *Pritzel's Thesaurus*, ed. 2, p. 188, will supply the titles of the more important of these

of latter, named A. King, has large extra wide flowers majesta-coloured, with a white band across the lower petals; *Crimum Powellii* var. *alba*, flowers of which were shown in the same collection, was awarded a First-class Certificate, all except the anther is pure white (Silver Banksian Medal).

Messrs. J. VEITCH & SONS showed sprays of various hardy plants, such as *Ptelea trifoliata*, with bunches of seed-vessels and strong foliage; *Hypericum floribundum*, *Hydrangea quercifolia*, *Coprosma acerosa*, with small translucent lilac-tinted berries. *Clerodendron trichotomum*, *Colutea arborescens*, and *C. a. purpurea*, also *Eugenia Ugni variegata*, with pretty white and green foliage; and others.

Messrs. R. WALLACE & CO., Colchester, made a capital display with varieties of *Lilium auratum*, *L. speciosum*, *Gladiolus*, &c. (Silver Banksian Medal).

A yellow double-flowered variety of *Rudbeckia*, named Golden Glow, exhibited by Messrs. BARR & SONS, and others, was recommended an Award of Merit.

DAHLIAS.

It is admitted on all hands that Dahlias are doing remarkably well this season, making a generous growth, and promising fine blooms for exhibition. That they are early, there was ample evidence on this occasion. Several new Cactus varieties put in appearance, and it is satisfactory to note that the true Cactus type is being developed in the new forms in course of production.

Mr. J. STREWDICK, Silverhill, St. Leonard's, submitted several new Cactus Dahlias, among them *Miss Agnes Box*, bright red, flushed with a dark shade, large in size, with a tendency in some of the outer petals to become flat (Award of Merit). *Daffodil primrose*, a pale form of *Lady Penzance*, but a more refined Cactus type, novel and distinct, a real acquisition (Award of Merit). *Jubilee*, crimson, with a dark centre, a very promising dark variety that is pretty certain to obtain an Award during the season. *Major H. C. Wilson*, pale crimson, with dark centre, a true Cactus type; *Mrs. Fern Barker*, reddish-purple, shading to purple at the petal points; and *Miss Margaret Stredwick*, yellow, flushed with reddish-salmon.

Messrs. J. CREAL & SONS, Lowfield Nurseries, Crawley, had several new Cactus varieties, which will, no doubt, be seen in better condition later in the season. They were *Mrs. Quentin*, rich salmon-rose, deepening to rose, a distinct and highly promising variety; *King of Slam*, rich crimson-maroon, with a dark shading in the centre, true Cactus type, distinct, and very promising; *Profusion*, a Pompon-Cactus of the true character, bright purple, small, compact; *Mrs. Gilbert*, crimson, small, but promising, &c. They also had twelve bunches of Cactus varieties, three blooms of each, the most promising being *Cycle*, *Mrs. Pearl*, *Beatrice*, *Mrs. Kingsley Foster*, *Starfish*, *Fusilier*, &c. Also twelve bunches of single varieties, and the same number of Pompons.

Mr. J. WALKER, nurseryman, Thame, had sixty blooms of show varieties, of excellent quality for so early a period. Prominent among them were *Duke of Fife*, *T. S. Ware*, *W. Keith*, *John Stindill*, *J. Ashby*, *Warrior*, *Shirley Hibberd*, *Harrison Weir*, *William Rawlings*, *Perfection*, *R. T. Rawlings*, *J. Hickling*, *Horcules*, *Dandy*, &c.; also four dozen blooms of Cactus varieties, a few of the best being *Matchless*, *Fusilier*, *Lady Penzance*, *Earl of Pembroke*, *Miss A. Nightingale*, and *Beatrice* (Silver Banksian Medal).

Mr. S. MORTIMER, nurseryman, Farnham, had eighty-four blooms of show varieties, chief among them *Colonist*, *J. C. Vaughan*, *Goldfinder*, *J. T. West*, *Duke of Fife*, *Crimson King*, *J. N. Keynes*, *Mrs. Gladstone*, *R. T. Rawlings*, *Arthur Rawlings*, &c.; also sixty blooms of Cactus varieties, such as *Countess of Radnor*, *Mrs. Wilson Noble*, *Cycle*, *Starfish*, *Matchless*, *Lady Penzance*, and *Harmony*.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair, and Messrs. Jas. O'Brien (Hon. Sec.), F. Sander, H. M. Pollet, J. G. Fowler, T. Statter, W. H. Protheroe, H. J. Chapman, W. H. White, W. H. Young, J. Jaques, E. Bill, C. Winn, W. Cobb, J. Douglas, S. Courtland, and A. H. Smee.

Messrs. Jas. VEITCH & SONS, Ltd., Royal Exotic Nursery, King's Road, Chelsea, exhibited *Odontoglossum Pescatorei* *Harrisianum*, with a large branched inflorescence bearing numerous finely-formed flowers. The sepals are white tinted with pink, and having some clearly defined spotting of purple colour in the central part; the petals are white with some bright purple spots on the inner halves; the base of the lip around the yellow crest is also decorated with purple (Award of Merit). Messrs. VEITCH also showed two distinct forms of *Lælio-Cattleya* × *Clonia* (L.C. Warszewiczii ♀, L.C. × *elegans* ♂), the one with a labellum almost wholly light-purple coloured, and the other with base to the lip, tinged in part with yellow, and in which the interior portion was bright purple, a fine form of L.C. × *Callistoglossa ignescens* (C. Warszewiczii × L. purpurata); and *Cattleya* × *Atalanta* (Leopoldi × Warszewiczii).

Messrs. F. SANDER & CO., St. Albans, showed a small group in which were plants of the yellow *Sobralia xantholeuca*; the new *Sobralia Holfordi*, with fine rose-purple flowers, the front of the lip dark rose-purple, the base white changing to yellow in the centre; a fine example of *Odontoglossum Kramerii* with many flowers; *Odontoglossum Pescatorei* *conspicuum*, large in size, and with a broad lip, handsomely marked round the edge with dark purple; *O. Schleiperianum*, *O. crispum*, *O. Bictoneuse album*, *Cattleya Warszewiczii*, *Bifrenaria aurantiaca*, and *Cypripedium* × *Lawrencei* *Druryi*, with ivory-white flowers, tinged with emerald green, and marked with dark rose lines. By the parentage it should be C. × *Cybele*.

Messrs. HUGH LOW & CO., Clapton, were awarded a Bronze Banksian Medal for a group consisting of *Cattleya Gaekelliana*, C. Rex, C. Warszewiczii, C. bicolor, C. Eldorado alba, *Dendrobium venustum*, some fine forms of *Oncidium Papilio*, O. Jonesianum, O. Lanceanum, O. luridum, *Cypripedium* × *macropterum*, C. × *Chas. Canham*, C. *tonsum*, C. *Charlesworthi*, &c.

Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr., Mr. W. H. White), showed a grand plant of *Platyclinis filiformis*, with ninety-four of its elegant spikes of yellow flowers gracefully around it (Cultural Commendation); *Epidenium* (Nanodes) *Matthewsii*, a species of small growth, and of the habit of *N. Medusa*, and with numerous greenish flowers tinged with rose (Botanical Certificate); the handsome *Eulophia guineensis*, with rose-coloured sepals and petals, and broad pink lip, with purple lines in the centre; and *Madevalla infracta purpurea*, with many flowers.

Sir FREDERICK WIGAN, Clare Lawn, East Sheen, showed two splendid spikes of *Lælio-Cattleya* × *elegans*, cut from the same plant; and some fine flowers of *Imelia crispae*, and *Madevalla macrura*.

ELIJAH ASHWORTH, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. Holbrook), showed *Lælio-Cattleya* × *elegans* var. *Schroderiana*, in colour one of the darkest and richest yet observed; sepals and petals of a very dark purple colour; side lobes of the lip flesh-tinted and veined and tipped with purple, the broad, flat front lobe being of an intense dark ruby-purple hue. It was stated to have been purchased of Messrs. F. Sander & Co. under the name given (Award of Merit).

THOS. STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed the new blue *Dendrobium*, *Victoria Regina*, described in the *Gardeners' Chronicle*, June 19, 1897, p. 399; and which, in point of colour, is a decided acquisition, the outer two-thirds of each segment being dark purplish-blue (Award of Merit); and *Cattleya Dowiana magnifica*.

J. GURNEY FOWLER, Esq., South Woodford (gr., Mr. J. Davis), showed four hybrid *Cypripediums*, which seen separately may get mistaken the one for the other; but, seen together, give evidence of being very distinct! The finest was C. × *Callo-Rothschildianum*, with ivory-white sepals and petals tinged with rose, the upper sepal being closely lined, and the broad petals profusely spotted with a purplish-brown (Award of Merit); somewhat resembling it were C. × *Marsalium* (supercillare × *Rothschildianum*), and C. A. de *Larise* (Curtisii × *Rothschildianum*); the other was C. × *Neptune* (lo grande × *Rothschildianum*), except that the petals are narrower, more horizontally extended, greenish in tint, and irregularly blotched with dark brown. Mr. Fowler also showed a fine spike of the bright red *Renanthera Storci*.

G. W. LAW-SCHOFFIELD, Esq., New-Hall-Hey, Rawtenstall, Manchester (gr., Mr. Shill), sent a cut spike of *Lælio-Cattleya* × *elegans*, New-Hall-Hey variety, apparently intermediate between the Turneri and the Schilleriana section. The sepals and petals are white, tinted with lilac, the front lobe of the lip and tips of the side lobes of a very dark purple hue.

W. H. LUMDEN, Esq., Balmedia, Aberdeenshire (gr., Mr. G. Roberts), sent *Cypripedium* × *Balmedianum* (reputed parentage *Stoneli* × *Fairiesium*), which the Committee decided did not bear out the record. The inflorescence was three-flowered. The sepals and lip partook much of C. *Stoneli*, but the former bore more numerous dark lines; petals curved downward, and they were narrow, and greenish, with some chocolate-coloured lines and spots. Leaves light green, with dark green transverse lines, like some of the forms of C. × *Harrisianum*, and scarcely possible if the record were true.

REYNOLD YOUNG, Esq., Sefton Park, Liverpool (gr., Mr. Poyntis), sent *Cypripedium* × *Eyerannianum* var. *Hermione*.

R. I. MANSUR, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), showed *Lælio-Cattleya* × *Andreae* (L.C. × *elegans* × C. *bicolor*), a very distinct hybrid, with large flowers, sepals, and petals bluish-white, the lip being strongly characteristic of C. *bicolor*, the middle lobe very much elongated, and of a bright purple, margined with white.

Fruit Committee.

Present: Philip Crowley, Esq., Chairman, and Messrs. T. Francis Rivers, Jas. H. Veitch, A. F. Barron, J. Wright, Alex. Dean, Geo. Wythes, H. Balderson, W. Farr, F. Q. Lane, Jas. Smith, and G. Reynolds.

Messrs. GEO. BUNYARD & CO., Maidstone, were exhibitors of a collection of fruit commendable for the present: date of the season. Included were twenty-eight dishes of Apples, a number of which were varieties of *Codlins*, one dish of *Lawson Pear*, *Peach*, *Apricot*; also *Hemakirk*, *Moor Park* and *Blenheim Appricots*; *Peaches Hale's Early*, *Early York*, and *Early Grosse Mignonne* (Silver Knightian Medal).

A box of absolutely first-class fruits of the *Royal George*; *Peaches* was shown by Mrs. ASBOTT, South Villa, Regent's Park, N.W. (gr., Mr. Geo. Kell) (Cultural Commendation).

Messrs. J. VEITCH & SONS, Chelsea, exhibited fruits of a late Gooseberry named *Golden Gem*, from a cross between *Whitesmith* and *Antagonist*. The berries are large, rather long, yellow, thin in skin, and generally satisfactory (Award of Merit).

Mr. W. SMYTH, Basing Park Gardens, showed plants from the open of kidney Bean *Golia*, obtained from a cross between *Smyth's Seedling* and *Champion Scarlet Runner Bean*. The plants shown exhibited very marked productiveness, the pods being long, exceedingly numerous, and smooth.

Mr. WADDE, of the Cliveden Gardens, Maidenhead, showed three branches of *Blackberry "Kittatiny"*. Its productiveness was very remarkable (Award of Merit).

In the Apple and Pear competition 2nd prizes were awarded. These were obtained by Mr. Geo. WYTHES, Syon House Gardens, for *Jargonelle Pears* and *Lady Sudeley Apple*.

A capital collection of fruit from Lord FOLKE, Ruxley Lodge, Claygate (gr., Mr. J. W. Miller), contained fine dishes of *Figs Brunswick* and *Brown Turkey*; *Peaches Royal George*, *Alexander*, *Noblesse*, and *Violette Hative*; *Elruge Nectarines*, *Warrington Gooseberry*, *Morello Cherries*, a dish of *Mulberries*, *Cob* and *Filbert Nuts*, *Melons William Tillery*, three dishes of Apples, and a few bunches of Grapes not perfectly ripe (Silver Banksian Medal).

The Lecture.

Cross-Fertilisation of Florists' Flowers.

A paper upon this subject was given by Mr. J. DOUGLAS, who commenced by stating the importance of the work, and enumerating some of the results as evidenced in the *Auriculas*, *Carnations*, &c. When hybridisation had been effected between allied species, a certain degree of variation occurred, but this was abundantly increased when the hybrids were again crossed with each other. Thus was variation obtained quickest. Selection was much slower in producing results. Mr. Douglas remarked upon his experience with *Sonchelo cruentus*, stating that he had sown seeds from this plant for four years, and had obtained but little variation, but on making a cross between it and a garden *Cineraria* a very great variety resulted, and some of the plants were pretty. After referring to Dean Herbert, and reading a quotation from his writings to the effect that a plant was most improved after cross-fertilisation had been commenced, Mr. Douglas mentioned the names of the Revs. Horner, and Engleheart, and Mr. Martin R. Smith, each of which had done work, by the cross-fertilisation of *Auriculas*, *Narcissus*, and *Carnations* respectively, that would last for many years. Referring to *Rea's Flora* in 1676, Mr. Douglas found that there were at that day as many as 360 varieties of *Carnations*. It may surprise some of our readers to hear that there were as good bizarre and flaked *Carnations* 110 years ago as we have now. In proof of which Mr. Douglas exhibited a plate in the *Botanical Magazine* of that date (tab. 39) which represented as good a flower in form and colour as any known by present day florists. A letter from Mr. MARTIN R. SMITH was next read, from which the audience obtained an idea of the extreme care that is taken by this gentleman to prevent adventitious pollination when cross-fertilisation is intended. He also referred to the predominant influence of the pollen-bearing parent over the seedling. The effect of some remarks that were afterwards made by Mr. Douglas was that in the great majority of cases the pollen-bearing parent exercises a predominant influence, and this was the case even when *Germania*, a variety of unusual individuality, was used as the seed-bearing plant. There were, however, exceptions to this common rule.

Mr. DOUGLAS next urged the importance of the choice of parents, stating that the characteristics desired in the seedlings should be present in both, or, at any rate, one of these. The points of quality in most of the florists' flowers are given in *The Code of Rules for Judging*, published by the Royal Horticultural Society.

The necessity for removing the anthers from the plant to be cross-fertilised before these or the stigma have developed, was next alluded to, and when the stigma has so far developed as to be ready for pollination, the pollen from the plant it has been decided should be the other parent should be applied. This might be repeated once or twice if it be doubted that fertilisation has taken place.

Mr. Douglas did well to remind his hearers that a large number of seedlings thus obtained may contain very few valuable ones, stating that if there be one in five hundred there is cause for satisfaction. Is there a summit of excellence in a flower, beyond which we cannot go? asked Mr. Douglas; he answered it himself in the affirmative. Several instances of varieties of plants nearly half a century old, and that still remain the best of their section were given, including that of the grey-edged *Auricula George Lightbody*. Such flowers could be further developed probably upon other lines, but in the same direction improvement appeared impossible of attainment.

Dr. MASTERS, F.R.S., in proposing a vote of thanks to Mr. Douglas, referred to the circumstance that up to that day a statue to the memory of the late Chas. Darwin was being unveiled in Shrewsbury, his native town, and reminded the meeting of the great value of the investigations and experiments he made, in regard to the fertilisation of plants, and the significance attending the slightest variation observed in them.

Mr. A. DEAN offered a few remarks upon the subject of the paper; after which Mr. COLVILLE BROWN remarked that seedling *Carnations* that were single flowered in the first year, had become semi-double the second, and quite double the third year. He had carefully observed this himself, and when fully double the flowers were of good quality. Mr. JENKINS remarked in reference to the preponderating influence of the pollen bearer, that he had crossed two white *Carnations*, and in the seedlings there was nearly every colour represented, but few scarlets. He thought this evidence was against the theory.

Fruit.—The most important open class was the eighteen kinds, distinct, and here Mr. D. Gibbons, gr.

JOHNSTON, Esq., Kingston-on-Thames, was 1st, he having the Grapes, the Black Hamburgs especially; a Melon named Windsor Castle, Peaches, and Nectarines; the 2nd prize fell to Mr. J. HAYES for an almost equally good exhibit.

For a smaller collection of Fruit, with six kinds, open to the County only, Mr. J. HAYES was the winner of the 1st prize and the Silver Medal of the R. H. S.

Mr. J. WILSON, gr. to Mrs. MIDDLETON, Haselbech Hall, was 1st with three perfect, grandly coloured bunches of Black Hamburg Grapes; and for three bunches of White Grapes, Mr. JORDON, gr. to Lord ANNALTY was 1st with Muscat of Alexandria.

Quantities of prizes were awarded for all kinds of Hardy Fruits in season, Melons, &c.

For a collection of twelve kinds of Vegetables, Mr. DYMACK, gr. to B. WESTWORTH, Esq., Stoke Bruerne Park, was 1st, showing good Carrots, Turnips, and Celery; Mr. J. HAYES being 2nd.

Mr. J. KNIGHTLY had the best collection of nine kinds open to the County, taking also the Bronze Medal of the R. H. S.

The competition in the Amateur and Cottagers' Classes was keen, and the exhibits of more than ordinary merit.

THE MIDLAND CARNATION AND PICOTEE.

AUGUST 5, 6.—This is now the most important exhibition of Carnations held in the kingdom, for, as Birmingham stands midway between the London and Manchester districts, it is able to draw supplies of flowers from both; and it has a remarkably strong contingent of growers of its own. The show was not only an extensive exhibition, but one of much higher quality than could have been expected, it being feared that the hot weather of the previous few days had seriously affected the quality of the blooms. But it had not done so. The exhibition-house in the Botanical Gardens at Edgbaston is well adapted to display the flowers to the best advantage; it is light and airy, and then there is running through a considerable portion of it a background of Fuchsias and other flowers, plants which impart an added effect to the stands of cut blooms arranged in lines in front of them.

The leading class was for twelve Carnations, there being six exhibitors. The 1st prize was taken by Mr. J. EDWARDS, Blackley, Manchester, who had very fine blooms indeed of J. G. Hedderley, Mrs. Rowan, Robert Houlgrave, Sportsman, Sarah Payne, sent out about forty years ago, and still one of the best P.P.s. Master Fred Ellis Crossley, Lord Salisbury, Edward Rowan, Mrs. Gunn, Joseph Lakin, and a seedling. Mr. TOM LLOYD, florist, Todmorden, was 2nd with very good blooms, among them a brilliant C.B. named Medhurst's seedling, Gordon Lewis, Lady Mary Currie, Master Fred, J. Wormald & F., and Admiral Curzon.

There were fourteen stands of six blooms, Mr. C. F. THURSTON, Wolverhampton, was 1st with remarkably good blooms of Edward Adams, William Skirving, George Melville, Flemingo, Cristigalli, and Robert Houlgrave. Mr. A. R. BROWN, Birmingham, was 2nd.

In the class for twelve white-ground Picotees, seven stands competed. Mr. R. SYDENHAM taking the 1st prize with highly refined blooms of Ganymede, Mrs. Payne, Clio, Jessie, Pride of Leyton, Muriel, Esther, Favourite, Thomas William, Little Phil, Somerhill, and Scarlet Queen, a brilliant heavy scarlet-edged flower. Mr. T. LORD was 2nd, having, differing from the preceding, Brunette, Mrs. Wilson, Polly Brazil, Lady Louise, Mrs. Sharp, and Mary Anstie.

There were nineteen stands of six varieties, Mr. A. W. JONES, Handsworth, Birmingham, being placed 1st with Little Phil, Mrs. Openshaw, Muriel, Madeline, Somerhill, and Heart's Delight. Mr. T. W. GOODFELLOW, Walsall, was 2nd; and Mr. C. HEAD, Hilden Bridge, 3rd.

Yellow grounds and fancies, both increasingly popular sections, were fully and very nicely represented. There were ten stands of twelve blooms, Mr. A. W. JONES taking the 1st prize with grand flowers of Voltaire, The Dey, The Gift, Cardinal Wolsey, Geo. Cruikshank, Xerxes, Harlequin, Eldorado, Ladas, and Golden Eagle—a very fine selection indeed; Mr. R. SYDENHAM was 2nd, his finest blooms were Yellowhammer, Monarch, Virgo, London, and May Queen; Mr. A. R. BROWN was 3rd with a stand which a very few years ago would have distanced everything.

There were fifteen stands of six blooms: Mr. C. F. THURSTON was 1st with Eldorado, Voltaire, Yellowhammer, Golden Eagle, Mrs. Douglas, and Cardinal Wolsey; Mr. R. C. CARTWRIGHT, Selly Oak, was 2nd.

The best stand of six yellow-ground Picotees came from Mr. A. W. JONES, who had in very fine character Voltaire, The Gift, May Queen, Golden Eagle, Xerxes, and Mrs. R. SYDENHAM; Messrs. THOMSON & Co., Sparkhill, Birmingham, were 2nd, with The Gift, Voltaire, Eldorado, Golden Eagle, Ladas, and Mrs. Douglas.

The selfs were, as is usual, a striking feature, as they not only have soft tints in some flowers, and deep and brilliant ones in others, but they also afford sharp contrasts of colour. Out of twelve competitors, with the same number of blooms, Mr. A. R. BROWN was 1st with Britannia, Little John, Mrs. Eric Hambro, Bendigo, deep purple; Braw Lass, Her Grace, Hayes' Scarlet, Germania, King of Purples, Lady M. Currie, Nabob, and Topsy; 2nd, Mr. R. SYDENHAM, some of the most striking blooms, in a very fine stand, being Mrs. Rowan, Britannia, Her Grace, Theodore, a beautiful sweet scented heliotrope-tinted self; Percy and Germania.

There were fourteen stands of six selfs, Mr. A. W. JONES

taking 1st prize with excellent blooms of Fiery Cross, Britannia, Mrs. E. Hambro, Sea Gull, Miss Audrey Campbell and Germania; 2nd, Mr. C. F. THURSTON.

Then followed five classes for varying numbers of flowers shown without paper collars, and with a minimum of dressing, each flower staged singly in bottles with a certain length of stem, and confined to a given space of tabling; these classes brought a great many blooms together, many were seedlings, most unnamed, but they were scarcely effective, and beyond forming a mass of bloom, it is difficult to say what object-lesson they served. The blooms, which, were of good size and symmetrical, fresh and bright, won the prizes. If these classes are continued in the schedule, greater space should be afforded them. In addition there were four classes for undressed border Carnations cut with long stems, buds and foliage; in some of the classes five sprays were required, in others three. Here the varieties were mainly seedlings, but few were named; the collection which took the leading prizes were of a promising character, but some flowers were staged which brought little credit to the exhibitors. These classes urgently need some revision in the future.

In the various classes for single blooms, a very large number were staged. Carnations: Robert Lord and R. Houlgrave were the best S.B.'s; C.B.'s, J. S. Hedderley and Master Fred; P.P.B.'s W. Skirving and Sarah Payne; S.F.'s, Edred and Sportsman; R.F.'s, Seedling from T. Lord; P.F., Gordon Lewis. Picotees: H. Red E., Ganymede and Ne Plus Ultra; L. Red E., Thomas William and Mrs. Gorton; H.P.E., Mrs. Openshaw and Muriel; L.P.E., Pride of Leyton and Mary; H. Rose E., Madeline and Lady Louise; H. Scarlet E., Mrs. Sharp and Scarlet Queen; L. Ro. E., Favourite. Selfs and Fancies: White, Mrs. Eric Hambro and Mrs. Lee; Yellow, Germania took the first three prizes; Pink, Mrs. T. Halliwell; Crimson, Topsy and Negress; Y.G. Picotee, Mrs. R. Sydenham; Fancy, Voltaire and Monarch. Premier Flowers.—Carnations: Biarritz, Robert Houlgrave, S.B., from Mr. J. EDWARDS; Flake, Gordon Lewis, P.F., from Mr. R. SYDENHAM. Picotees: H.E. Ganymede, Red E., from Mr. R. SYDENHAM; L.E., Somerhill, P.E., from Mr. A. W. JONES; Yellow Picotee, Mr. Douglas, from Mr. C. F. THURSTON. Self: Her Grace, bluish, from Messrs. THOMSON & Co. Fancy: Voltaire, from Mr. A. W. JONES.

Certificates of Merit were awarded to the following new varieties:—L.P.E. Picotee Harry Kenyon, from Mr. J. WITHAM; Medium R. E. Picotee, Grace Ward, and R.F. Carnation Mrs. R. Lord, both from Mr. T. LORD.

Some classes included floral arrangements with Carnations, and several shower-bouquets were staged, made up of Carnations and appropriate foliage. Mr. C. BLOK, gr. to M. R. SMITH, Esq., Hayes Common, Kent, took the 1st prize with one that commanded general admiration; Mr. W. T. GUNN was 2nd.

Sprays and button-holes were in plenty. The best table arranged with Carnations and foliage came from Miss B. MAYELL, of Acock's Green; as there were seven of these tables, and all were good, they had a very pleasing effect.

Bunches of Sweet Peas were a charming feature. Prizes were offered for nine bunches of two dozen or so sprays. The best came from Mr. B. SYDENHAM, whose leading varieties comprehended some of the best grown.

Mr. H. ECKFORD, of Wem, offered prizes for twelve bunches, and several collections of leading varieties were staged. Then there was a class for an epigone of Sweet Peas; several were staged, some of which were very pretty.

The Society's Challenge Cup, won twice in succession by Mr. ROBERT SYDENHAM, now becomes his property; and the Turner Memorial Cup is now the property of Mr. A. W. JONES.

The Botanical Society's Silver Medal was awarded to Mr. J. H. WHITE, Worcester, for a very fine bank of cut flowers; the Silver Medal to Messrs. W. & J. BIRKENHEAD, Sale, for a very fine collection of Ferns; to Mr. B. R. DAVIS, Yeovil, for some superb Begonias; to Messrs. HENNETT & Co., Solihull, for a table of plants and flowers of excellent quality; and to Mr. HENRY ECKFORD, Wem, for one of his unique collections of Sweet Peas. A Bronze Medal was awarded to Mr. W. T. GUNN, Nottingham, for a collection of flowers.

MAIDENHEAD HORTICULTURAL.

AUGUST 10.—The twentieth exhibition of the above Society was held in the grounds of ARCO GOLD, Esq., Ives Place, on the above date. The entries were scarcely as numerous as on some former occasions, although the quality of the exhibits generally was of a high standard of merit. The leading groups were nearly perfection, and left little to be desired, being bright and effective, while fruit and cut flowers were very good, and vegetables in the special classes were excellent. Specimen plants were poorly shown, excepting Ferns. Collectively, the show was a very good one, but there seemed to be a lack of local enthusiasm, and was poorly patronised during the afternoon and evening, and evidently something more than a purely horticultural exhibition is required now-a-days to draw the masses.

Groups.—In the class for the largest group, 12 feet by 10 feet, the competition was keen, and so close were the two leading exhibits, that the judges awarded them equal 1st prizes. There seemed to be an opinion, that was very generally shared by the observers, that the group put up by Mr. D. PHILLIPS, gr. to A. N. GILBEY, Esq., Cookham, should have taken precedence, being decidedly more lightly arranged than that of Mr. AITKEN, gr. to Colonel MERRICK, Riching's Park, Slough. The latter, had

some good *Pancreatium* in his group, which appeared to have considerable weight on the decision, although his white pyramidal *Campanulas* were very poor. Mr. PHILLIPS' group had a central *Coccos Weddelliana* on a mound of *Adiantum*, plants of the latter also forming the groundwork; at each corner there stood a handsomely coloured *Croton*, while *Oncidium flexuosum* and *Inoum* were used very effectively, other plants used being *Francoa*, *Gladolus*, *Campanula*, *Eulalia*, *Dracena Sanderiana*, and *Caladium*. For the smaller groups measuring 7 feet by 6 feet, Mr. Fulford, gr. to D. LAMBERT, Esq., Cookham, was a good 1st; 2nd, Mr. J. W. Richardson, gr. to G. HARRIS, Esq. Mr. Fulford was 1st for excellent table plants, in which there was a strong competition.

For twelve handsome foliage plants, the same exhibitor was an easy 1st, having finely-coloured half specimen *Codiaeums* (*Crotons*) *superba*, *Bumaine*, *Alphurthea*, and Mrs. Dorman; *Dracenas* A. Laing and *superba* among his best plants. Mr. AITKEN was 2nd. The latter exhibitor was 1st for six stove and greenhouse plants, and also one specimen foliage and one flowering plant, with the latter winning easily with a large and finely-flowered *Ixora Williamsii*; Mr. PHILLIPS being 2nd, with a fine *Eucharis grandiflora*; and with a foliage plant, Mr. Wood, gr. to Lord Boston, Hedsor, was 3rd.

The exhibits of Ferns were good. For six stove and greenhouse, Mr. AITKEN was 1st with fine plants, among others, of *Microlepia hirta*, *Davallia Mooreana*, *D. filifolia plumosa*, and *Adiantum Farleyense*; 2nd, Mr. Fulford.

Mr. PHILLIPS was the only exhibitor of six small Pelargoniums with grandly trained and bloomed plants, 8 feet or more in diameter, that well deserved the award, a 1st, that was given. Mr. Paxton, gr. to the Hon. C. I. LEAY, Taplow, stood in a similar position with six *Fuchsias*, and was awarded the 1st prize.

Fruit.—The quality in general was good, although in some classes the competition was not keen. Mr. Goodman, gr. to Miss HAMMERSLEY, Abney House, Bourne End, was a good 1st for six dishes, with Muscat Grapes, Dagmar Peaches (finely coloured), Brown Turkey Figs, Hero of Lockinge Melon, Lord Napier Nectarines, and Kirke's Plums; 2nd, Mr. AITKEN.

For four dishes Mr. Johnson, gr. to A. GILLIAT, Esq., Stoke, Slough, was easily 1st with fine Madresfield Court Grapes and Humboldt Nectarines as his best dishes; 2nd, Mr. PAXTON. The latter exhibitor was 1st for four dishes outdoor grown with old Windsor Pears, Rivers' Early Peaches, Morello Cherries, and Moor Park Apples; Mr. Aitken 2nd.

In the four Grape classes, Mr. F. Cole, gr. to Sir G. RUSSELL, Swallowfield, Reading, took all the 1st prizes with fine bunches, although none of the Muscats were well coloured; in this class Mr. Fulford was 2nd, also with fine bunches, but not ripe.

Mr. GOODMAN was 1st with a fine dish of Peaches, highly coloured; 2nd, Mr. JOHNSON. Mr. GOODMAN was also 1st with a fine dish of Lord Napier Nectarine; 2nd, Mr. COLE.

Melons were not of high quality either in the scarlet or green-fleshed classes; for the latter, Mr. PAXTON received the 1st award.

Mr. GOODMAN received a 1st prize for a fine and ripe dish of highly-coloured Mr. Gladstone Apples.

Vegetables in collection and otherwise were very fine, special prizes for collection of six varieties being offered by Messrs. Sutton, Carter, and Webb & Sons. In the first mentioned competition Mr. GOODMAN was 1st, having New Intermediate Carrot, Satisfaction Potato, Autocrat Peas, Al Onions, Perfection Tomato, and Autumn Giant Cauliflowers; 2nd, Mr. RICKARD. Mr. W. Davis, gr. to H. Adams, Esq., and Mr. C. Young, gr. to the Rev. S. Cony were each 1st respectively in the two following collections with fine produce.

Miscellaneous exhibits were numerous and good. Mr. C. TURNER, Slough, had very fine boxes of cut Roses, Dahlias, and herbaceous flowers. Messrs. VETTON & Sons, Ltd., a large and varied collection of herbaceous flowers and annuals, including *Asclepias tuberosa*, *Phyllis capensis*, *Tritomas*, *Pentstemon* in variety, *Delphiniums* and *Gallardias*. Mr. A. WADDS, gr., Oliveden, sent a magnificent plant of *Peristeria elata*, with nine spikes of flowers, and a collection of Peaches. Mr. ROSE OWEN a collection of plants, with wreaths and other floral designs. Mr. E. F. SUCH, herbaceous flowers, with handsome wreaths, crosses, and bouquets in variety. Mr. W. BROUGHTON a group of decorative plants; and herbaceous flowers from Mr. H. DEVERILL, Banbury.

TRADE NOTICE.

MR. H. W. PITCHER, lately head-gardener at Allbury House, Surbiton, has taken over the management of the Surbiton Nurseries.

NOTICES TO CORRESPONDENTS.

BEECH: *Elm Park*. The tree is badly affected with white scale (*Adelges fagi*). The case has gone too far to be remedied. It will be better to take the tree down, strip off the bark and burn it.

BLACK CURRANT BUD-MITE: *R. H.* No cure, so far as we know of at the present; cut off and at once burn every affected shoot.

BOOKS: *X. Hardy Herbaceous and Alpine Flowers*, by William Sutherland (published by Blackwood & Sons, Edinburgh and London); Robinson's *English Flower Garden. Amateur*. The most modern manual on ornamental shrubs is A. D. Webster's *Hardy Ornamental Flowering Trees and Shrubs*, published at the *Gardening World* office, 1, Clement's Inn, Strand, W.C. A larger work is Augustus Montgredien's *Trees and Shrubs for English Plantations* (J. Murray, Albemarle Street, Piccadilly); but having been issued in 1870, it is probably out of print, and only to be met with at old book-shops.

BOUVDIAS: *A. T. Ewell*. The plants having grown too large for your frame, will take no harm if stood outside, on or in a bed of coal ashes or clean fine gravel till the end of September. As they are inclined to flower, you may pinch the stronger shoots once more, taking care to keep the plants gently moving for four weeks longer.

CHRYSANTHEMUM, TOPS OF SHOOTS INJURED: *F. G. O.* The work of earwigs. Trap them in Bean straw or pots filled with hay, emptying these every day, and destroying the earwigs. *E. M.*

COVERING THE BUDS OF ROSES WORKED LOW DOWN ON THE STOCK: *Inquirer*. Before covering the bud with the soil scraped away from the collar, you should wait till it has taken. We should suppose that there not being enough iron in the soil to be injurious to the Rose-stocks, it would not be injurious to the bud when covered with it. Six inches deep seems to us to be a rather excessive depth at which to insert the buds on any kind of stock. The treatment of La Grifferaie and Manetti stocks would be identical as regards the budding. A better union takes place if the wood is removed from the shield.

CUCUMBERS TURNING YELLOW, AND DYING FROM THE LOWER END UPWARDS: *J. Holt*. We agree with you that unsuitable, ill-prepared soil, and rank manure, with perhaps not enough porous material mixed with the loam, &c., are accountable for the mischief. It seems to us to be a very unwholesome kind of soil that was used, and you cannot do better than throw it out, obtain fresh sweet loam and decayed manure, make the bed 6 inches thick at the first, and have a fresh start with new plants. The manure should not exceed one-quarter of the whole, and if the loam be of a very heavy nature, put something with it—say, burnt clay (ballast), broken sandstone or brick-rubbish, coarse sand, or charcoal in pieces as large as Filberts. See that the water can pass freely away, and when the roots appear on the surface of the soil, top-dress it to the depth of an inch, and not more, with loam and horse-droppings, Thomson's Vine-manure, fish-manure, or a little Peruvian guano, sheep-droppings, pigeons' and chickens' dung, in a decayed state—any of them in moderation, but not more than one of them. In applying these top-dressings, place them thickest near the plants, so that the surface slopes away from the latter. Be sparing with the water-can till the soil gets filled with roots, and do not crop heavily.

ELRUGE NECTARINE FRUITS INJURED: *J. S., Swansea*. Caused by lack of ventilation when the sun is shining with full force on the house; in fact, the fruits were "scalded," in garden parlance.

FERNS FOR MODEL GREENHOUSE: *Fernist*. Your house is so small, in fact, merely a Fern-case, that but a very small collection can be accommodated, and we give you the names of a few suitable species, viz. *Adiantum tinctum*, *A. capillus-veneris*, *A. cuneatum*, *Asplenium marinum*, *As. flabellifolium*, *As. viviparum*, *Cystopteris tenuis*, *Davallia bullata*, *Doodia aspera*, *Gymno-*

gramma chrysophylla, *Laucheana*, *Hymenophyllum*, any of the species, *Lomaria gibba*, *O. auratum*, *Pteris cretica albo-lineata*, *hymenophylloides*, and *Trichomanes radicans* Killarney Fern.

FRUIT-TREES FOR A WEST WALL: *G. & S.* Plums: Jefferson's, Kirke's, Reine Claude d'Alsace, Reine Claude du Comte Atthem, Early Fat De Montfort, Guthrie's Late Gage, as varieties; and Diamond, Pond's Seedling Belle de Septembre for cooking. Pear: gonelle, Swan's Egg, an old, nice-eating, and variety, too much neglected; Thompson's Christen, Beurré Superfin, Fondante d'Alsace, Gratioli, Seckel, Brown Beurré, Doyenné B, Conseiller de la Cour, Beurré Bosc, Be Fouqueray, Baron de Melo, Glout Morve rondeau, Beurré Diel, B. d'Aremberg, Chat Marie Benoist, Nouvelle Fulvie, Ne Plus, and Doyenné d'Alençon. Peaches: Dagu Hogg, Gosbawk, among new varieties; an older, Barrington, Belle Beauce, Grosse Michel among old ones. Nectarines: Improved D Humboldt, Lord Napier, Rivers' Orange wick Elruge, and Victoria. Cherries: B de Schrecken, B. Noir de Schmidt, Elton d'Heidelinger, Black Tartarian, May Duke, and Archduke.

LABURNUM TREES IN GRAZING-LAND: *G.* safe trees to plant unless the area covered by branches is protected by a high fence, the plant, especially the seeds, being more poisonous when eaten.

MINING GRUB IN MARGUERITES: *A. B. C.* Cut burn all the badly mined leaves, and squeeze maggots, which may be found at the end galleries they have made in the other leaves, the thumb nail without bruising the leaf than is necessary. Quassia water and a soot-water, or soot applied dry will keep from laying its eggs on the leaves.

NAMES OF PLANTS: *Correspondents not in this issue are requested to be so good as send the following number.*—*H. Cleaver*. *sphaerocephalum*, *L.*—*A. S.* *Cattleya* *Lea Hortus*, 1, send in flower; 2, *Pellionia* *Day* 3 and 4, *Pellionia pulchra*; 5, *Fittonia* (*Gy chyum*) *Pearcei*.—*H. K.* *Oncidium* *pra* supposed natural hybrid between *O. Gardi* *O. dasytyle*; and *Mormodes pardinum* var. —*H. B.* So far as we can judge by see barren frond only, the Fern sent is *Oncol bilis*. We would like to see fertile and fronds of it again.—*R. B.* Specimen withered. It appears to be a pale variety common Broom.—*G. W. F.* *Alnus cord* *Naples Alder*, a good town tree.—*W.* *Clematis flammula*; 2, *Tecoma jasmino* *Picea sitchensis*; 4, *Leucothoe Cates* *Ylnus imperialis*; 6, *Lysimachia ciliata* Apparently a seedling variety of *G. draco*

NYMPHAEA LEAVES: *J. P.* On one of the leaves mass of eggs of one of the water-snails just No doubt the babies find the leaves very their taste.

PEACHES: *Z. A.* There is little doubt but that to the Peach leaves is due to burning or Ventilate more freely, and commence ear morning. In hot summer weather you can give Peach-trees too much fresh air. *J. S.* inclined to attribute the black spots upon to the puncture of some insect, but in themselves there is no evidence as to what it may be.

SEEDLING CARNATION: *A. B.* Judging from specimens you have sent us, we are not sure you have a valuable variety. You must use your own discretion, or obtain the advice of a specialist.

TOMATO: *J. Gader*. We are always pleased to receive information to our correspondents and subscribers in the multitude of things that reach us, but have to be dealt with hurriedly, things laid or lost at times, and even in some cases they do not reach us for lack of proper address or other reasons. You should send again.

VINES: *C. L.* The leaves have been ventilated more freely.

COMMUNICATIONS RECEIVED.—*T. B.*—Sutton & Sons—*W. B. H.*—*J. C.*—Shadwell—Thos. Denny.

SPECIMENS RECEIVED.—*J. C.*—Shadwell (next week)—*T. G. & Co.*

THE Gardeners' Chronicle.

SATURDAY, AUGUST 21, 1897.

THE HISTORY OF THE JERUSALEM ARTICHOKE.

THE early history of *Helianthus tuberosus* may, like that of mankind, be regarded under three divisions—a traditional, an early botanical, and a mediæval and modern. Of these the traditional resolves itself into the fact of its having been cultivated as an article of food by the Indians of North America before the settlement in that country of Europeans. The earliest evidence of this cited by Mr. Trumbull is that derived from Champlain, who, in 1605-6, observed that the Almonchiquois Indians (of New England) had "force des racines qu'ils cultivent, lesquelles ont le goût d'Artichaut." To this Mr. Trumbull adds that it is to these roots that Lescardot alludes (*Hist. de la Nouv. France*, 1612), when, speaking of the same Indians and their country, he says that the latter contains a kind of roots, "grosses comme navet, très excellent à manger, ayant un goût retirant aux cardes, mais plus agréable, lesquelles plantées multiplient en telle façon que c'est merveille." Following these is Sagard Theodat, who, in his *Histoire des Canada* (1636), mentions the roots which we, the French, call "Canadiennes, or Pommes de Canada."

Proceeding now to the mediæval history, or that of the cultivation of this plant in Europe, it seems to have been introduced into England very shortly after, if not before it had attracted the attention of travellers as being propagated by the Indians in America as a food product, for in the year 1617, Mr. John Goodyer, of Maple Durham, Hampshire, received two small roots of it from Mr. Franquevill, of London, which, being planted, enabled him before 1621 "to store Hampshire." In October of the same year Mr. Goodyer wrote an account of it for T. Johnson, who printed it in his edition of Gerard's "*Herball*," which appeared in 1636, where it is called "*Jerusalem Artichoke*." Previous to which, in 1629, it had been figured and described under that name by Parkinson in his "*Paradise*" and "*Theatrum*."

From the last given date to the present time the Jerusalem Artichoke has been extensively cultivated in Europe, but rather as a garden vegetable than a field crop, and has extended into India, where it is making its way amongst the natives under Hindoo, Bengali, and other native names. In Káthiawar, according to Watt (*Dictionary of Economic Products of India*), it is boiled in milk, and considered by the natives to be a strengthening vegetable. Aitchison states that it is grown in gardens of Herat and Mesched under the Persian name of Seb-i-zamini-angrez ("Notes and Products of West Affghan and North-East Persia," in *Trans. Bot. Soc. Edin.*, vol. xviii.).

It is very curious that the native country of a plant so well known in gardens, and in a wild state throughout the length of the Central United States, and in Canada, should have for

upwards of 250 years been considered doubtful. This was owing mainly to the vague indications of its origin given by the early authors, Brazil (following Bauhin) by Linnæus in the *Species Plantarum*, Canada by Parkinson, and by Linnæus in his *Hortus Cliffortianus*, and Peru according to Hernandez. In De Candolle's *Geographie Botanique* (vol. ii., p. 983) it is referred to the list of "Espèces inconnues à l'état sauvage," and subsequently (p. 988) as "probably North America." Even in the body of the third edition of his admirable *Origine des Plantes Cultivées* (p. 34), published in 1886, he regards the question as unsettled; and in the additions and corrections cites Gray's erroneous opinion, that it is the *Helianthus doronicoides*, Torr. and Gr. And yet, though there has been no lack of indigenous specimens in European herbaria, identical with the cultivated, no one seems to have thought of going to the Herbarium to solve the difficulty. In 1855 Asa Gray's attention was drawn to the subject from having received some long, narrow tubers, which he considered to be *Helianthus doronicoides*, Lamk., with the statement that it had been found to be good food for hogs. These were planted in the Cambridge (U.S.) Botanical Gardens, and were found to produce after two or three years, thicker and shorter tubers, which, when cooked, resembled Jerusalem Artichokes in flavour, though coarser. This led Dr. Gray to conclude that *H. doronicoides* was most probably the original of *H. tuberosus*, an opinion which was strengthened by subsequent observations published in the second edition of his *Manual of the Botany of the N. United States* (1865). Matters, however, did not end here, for it was discovered that the *H. doronicoides*, Lamk., as described by American botanists, included two species, that so called, and the true *H. tuberosus*, Linn., and it was not till the publication in 1884 of the Order Compositæ in Gray's *Synoptical Flora of N. America* that *H. tuberosus*, Linn., was definitely restored to its rank as a substantive species, and the origin of the Jerusalem Artichoke. I may add that *H. doronicoides* differs from *tuberosus* in the leaves being all, or nearly all, opposite, sessile, elliptic, never cordate, obscurely crenate, the rays much broader, and the ovary and achene glabrous. It is figured in this work, t. 2778, under the erroneous name of *H. pubescens*, Vahl.

It remains to add that *H. tuberosus* is indigenous in the lake region of Canada as far west as the Saskatchewan, and from thence southward to Arkansas and the middle parts of Georgia. Another near ally is *H. giganteus*, Linn., of which a figure has been prepared for this work, which will shortly appear.

Description.—*Helianthus tuberosus* is distinguished from all its congeners by the sum of the following characters: roots tuberous; stem tall, pubescent, branched above; leaves petioled, ovate, acuminate, serrate, scabrous above, puberulous beneath, the upper alternate; heads large; involute, bracts, lanceolate, acuminate; receptacle convex with dorsally hirsute scales; disc and ray-flowers both yellow, the latter twelve to twenty in number; achenes with pubescent tips and margins. *Sir J. D. Hooker*, in *Botanical Magazine*, July, 1897.

THE DISEASES OF PLANTS.

(Continued from p. 98.)

II.—REMEDIAL TREATMENT FOR DISEASES.

Copper Preparations for Spraying.—Sulphate of copper was one of the first copper fungicides used. Its value for mildews and mildew-like

diseases is not great, because even weak solutions are liable to burn and discolour the foliage. We shall consider it later, as a treatment for seed contaminated with fungi.

Copper carbonate as a fungicide is not a great success. The pure chemical is somewhat expensive, but as it is useful in certain preparations, to be described later, we give a method for making it cheaply:—Take (a) 3 lb. sulphate of copper (bluestone), dissolved in 2 gallons of hot-water; (b) 3½ lb. washing soda dissolved in 1 gallon hot-water; mix (a) and (b); add water up to 10 gallons, stir up, and allow to settle. The greenish sediment is copper-carbonate, and to get it pure, run off the clear fluid, add more water, then pass the whole solution through stout muslin; the powder left in the muslin is almost pure carbonate of copper. If mixed with water (1 lb. to 40 gallons), and stirred up, it can be used as a spraying solution; it is however more effective in some of the forms described below.

Ammoniacal solution of copper-carbonate is a clear blue fluid prepared by dissolving copper carbonate in liquor ammonia. As ammonia vapour is deadly to foliage, this mixture must be made up with care and away from young plants. The strong quality of ammonia (known in the trade as '880) is diluted in an earthenware (not metal) vessel with seven to eight times its volume of water, then mixed with the copper-carbonate powder; to avoid any excess of ammonia, it is necessary to stir thoroughly, and to add rather more copper-carbonate than will be dissolved. One formula which is nearly correct is: copper-carbonate 5 oz., ammonia (pure, strong) 3 pints. If the ammonia solution be weaker, a larger quantity must be used. Definite figures like these are however only a guide, there should never be more than a slight odour of free ammonia, and no large excess of undissolved copper-carbonate. The above solution before use may be diluted with from fifteen to twenty times its bulk of water, giving in all from 45 to 60 gallons of fungicide. This solution is clear and almost free from sediment, so that it may be used with any spraying apparatus; it is safe, and not likely to stain the foliage, or even maturing fruit, or flowers. It is thus a useful fungicide for a final spraying just before the crop is gathered. In its results it is weaker than Bordeaux Mixture, hence in some cases it is less reliable for effecting a cure.

Eau Celeste is practically the same solution as the above, but prepared in a different way. The original formula is: dissolve 2 lb. of copper sulphate in about 8 gallons of water; when completely dissolved add 3 pints of liquor ammonia ('880 quality), and dilute with water to 45 gallons. This is a strong fungicide liable to act on foliage.

Modified Eau Celeste is a fungicide ranking in excellence alongside of Bordeaux Mixture. To prepare it, dissolve 2 lb. copper-sulphate in hot water, and mix slowly with 2½ lb. washing-soda, also dissolved in hot water; this mixture is added to 1 quart of liquor ammonia ('880), and stirred. Before use, dilute with 50 to 100 gallons of water. It is a very cheap spraying fungicide, safe to use, and effective against mildew-fungi.

Bordeaux Mixture, or *Bouillie Bordelaise*, must be regarded as the best of all fungicides yet tested. It is a mixture formed by bringing together copper-sulphate and quick-lime in a large bulk of water. The resulting fluid, when properly prepared, is a deep sky-blue liquid in which is suspended a very fine greenish sediment. The quantity of each is

redient to be used, varies with the crop to be treated, and according to the experience of the user. At first a large quantity of copper-sulphate was used, as much as 18 lb. in 30 gallons of water; but experience has proved that a much weaker solution is equally good, while at the same time safer and cheaper. What in America is called "standard Bordeaux Mixture" contains: Sulphate of copper, 6 lb.; quick-lime, 4 lb.; water, 22 gallons. A more dilute, or "normal mixture," has the same weight of copper and lime in 45 gallons of water; while for Peaches, an even more dilute mixture may be required, with from 50 to 60 gallons of water. The preparation of Bordeaux Mixture is not difficult, but certain points need attention. The copper-sulphate used is the cheap or "commercial" quality, but as pure as possible, otherwise the Mixture may not have all the good effects desired. The lime should be obtained as "shells," and freshly slaked before using. In slaking, the water is added in moderate quantity, and at various times, so as to allow the lime-shells to absorb it equally, and break down into a fine powder; this is not the case when the shells are covered with water, or if they are left to take moisture from the atmosphere, the resulting powder is then liable to be gritty, and air-slaked lime sometimes has a different (in some cases an injurious) effect when used as a fungicide. With these precautions as to ingredients, proceed to make the Bordeaux Mixture as follows:—Dissolve 6 lb. copper-sulphate in warm water, and put into a barrel capable of containing about 44 gallons; in another vessel slake 4 lb. of fresh "lime-shells," and make up to a creamy whitewash with water; strain the lime through coarse canvas into the barrel with copper-solution, fill up with water, stir thoroughly, and the mixture is ready to use. This is the "normal" solution; the stronger or more dilute solutions are made by using less or more water, as already stated. The Mixture is most reliable when made up in quantity as just described, and used within twenty-four hours; but where not used on a large scale, it might be made up in concentrated form, and diluted as required. For this purpose it is best to use stock solutions, each containing known quantities. The copper-sulphate could be made, say, 4 lb. dissolved in each gallon of water. The milk-of-lime is best made fresh; but a stock solution of, say, 3 lb. of lime slaked and added to each gallon of water will keep well enough for a few weeks. Suppose the above stock solutions be at hand, and one wants 30 gallons of "normal" Bordeaux Mixture, it would be prepared as follows:—Dilute 1 gallon of stock solution of copper with 28 gallons of water, then add a gallon of the lime solution.

As it is important in all kinds of Bordeaux Mixture that no excess of copper remain, in other words, that there is plenty of lime present, a test known as the "ferrocyanide test," is frequently used. If a little of the Bordeaux Mixture be taken in a white porcelain dish or plate, and a solution of potassium ferrocyanide (1 oz. in 1 pint water) added, a red precipitate will be formed as long as there is excess of copper. Excess of lime will do no particular harm; indeed, many prefer it, because the Bordeaux Mixture is then slower in its action, but it tends to make the solution thick and liable to choke the spraying machines.

Bordeaux Mixture is sometimes made up with soap-solution and paraffin, or Paris Green, or London Purple, to make it a combined insecticide and fungicide, but this cannot be heartily recommended.

The action of Bordeaux Mixture is due to the suspended sediment, which consists of several compounds of copper and lime. The action of copper as a fungicide depends on the fact that its solutions attack and kill the protoplasm of living bodies. If one accepts this view, it explains why copper mixtures discolour foliage, more particularly young foliage, and cause it to wither. When made up in dilute solutions, the copper is unable to penetrate or injure the host-plant tissues, but is strong enough to attack the exposed parts of fungi on the surface of foliage, and to kill germinating spores. Neither Bordeaux Mixture nor any allied mixture can reach a disease living inside its host; it merely lies on the surface, and attacks fungi or parts of fungi which appear there. Hence the importance of an adhesive mixture with a somewhat slow action; these qualities seem to be best attained by the addition of lime with the copper, as in Bordeaux Mixture. Other methods have been suggested for making adhesive fungicides, for instance, the addition of treacle, but lime seems to make as adhesive a mixture as any, besides assisting to kill the fungi.

Spraying mixtures are applied to the plants by simply whisking them on with a bunch of twigs, or by more or less complex machines. We do not propose, however, to enter into any discussion of these; descriptions and illustrations of them may be found in the makers' catalogues (e.g., the Strawn Company, and other British and American makers). The more important points in a spraying-machine are:—(1) portability; (2) power to apply as fine a spray as possible over the whole crop, above and below the foliage; (3) thorough mixing gear, which will not easily corrode, choke, or otherwise get out of order.

With true British caution the use of Bordeaux and other spraying mixtures, although described and advocated by the *Gardeners' Chronicle* for at least eight years, has made slow progress at home in comparison with that made in France, Germany, and America. True, we have not had thousands of acres of vineyard ruined by mildew, nor the great orchards of America with their risk to disease—yet our crops are valuable, and it is well worth the consideration of every grower if it would not pay better to have a first-class crop, free from the effects of mildew and other pests, rather than the second-rate more or less defective produce one so often sees. This argument applies equally to fungus and insect-pests. The cost of spraying or other remedies is not great; labour is the largest item. On account of the limited use of such mixtures in this country, it is not easy to give reliable details in regard to treatment of crops. With Potato-disease, the results have been undoubtedly a success (see *Journal of the Board of Agriculture*, ii., 1895-96, pp. 45 and 465). In one case (Wiltshire, 1894), two sprayings with 20 lb. copper-sulphate, 20 lb. lime, 100 gallons water, were given at end of June and three weeks later, with general benefit, and a net gain of £4 16s. per acre in favour of the sprayed crop. Fruit-tree foliage liable to mildews or leaf-spot diseases may be safely sprayed with weak Bordeaux Mixture or ammoniacal solution of copper-carbonate two or three times in a season, beginning early; the results have been quite successful in North America, but details are required for this country. The 60-gallon Bordeaux Mixture is used for tender foliage, as in Peaches, Chrysanthemums, Cucumbers, and Raspberries; Currants and Strawberries are better with "normal" (45 gal.) Bordeaux. Tomato-mildew might be kept in check by weak Bordeaux Mixture, but reliable observations are yet to hand. In Vines liable to mildew are treated with Bordeaux (50 to 60 gallon mixture) once or before fruit-thinning, after this it is some risky, as it is apt to discolour the fruit. present, and until we get the experience of growers themselves, caution must be recommended in the use of Bordeaux and mixtures. Dilute solutions should be tried, then stronger, but a sharp look-out must be kept for any discoloration of foliage indicating a too strong solution. Experiment this kind carried out with care and observation on a fairly large scale, followed by publication and comparison of results in the garden press, are the only means by which we reach a true estimate of the value of fungicides.

Potassium sulphide or liver of sulphur fungicide well known in Britain, particularly for Rose, Gooseberry, and allied mildews. Applied in solution, from $\frac{1}{2}$ oz. to 1 oz. 1 gal. water, freshly prepared each time before use. *William G. Smith, Edinburgh.*

(To be continued.)

A GROUP OF ANTHURIUMS.

UPON the following page is reproduced a photograph, taken in May last, of a group of various Anthurium Scherzerianum growing in the garden E. M. Mundy, Esq., Shipley Hall, Derbyshire (Mr. Wm. Elphinstone). These very interesting beautiful stove-plants are cultivated with much success by Mr. Elphinstone, who, some time ago, obliged us by sending a collection of spathes for inspection. These cut spathes were, in fact, as dead, as compared with the figure of the plant first introduced, and they were excellent illustrations of superior cultivation. The varieties are not hybrids but descendants of the species, and those from Elphinstone were remarkable, not only for the spathes, but for variety and richness of colour varying from pale red and spotted markings, to scarlet to deep crimson. The largest spathe measured about 6 inches in length, and 4 inches in breadth.

STRAWBERRIES.

STRAWBERRIES provide all engaged in horticulture with a few weeks of closely occupied time, and as the work of the present season is over, look around to see what alterations or improvements can be effected for another year. Too seldom, however, do those who are seeking to make the cultivation of fruit profitable communicate their experience to the public for the general good; some of the old feeling still remains amongst market growers, the fortunate and mistaken spirit that knowledge is in business becomes valueless to the public, and is imparted to others. The facts point to the conclusion where discretion is exercised to do what concerns only the individual from that which affects the community at large. Wherever collections of fruit growers have been established there has been a more rapid improvement in methods which has retained and increased the amount of trade done; the competition and readiness to seize upon every advantage suggested or adopted by others invariably leads to an all-round improvement. There are many gardeners in private establishments who are particularly engaged in growing for market, and a true gardener is always eager to learn and impart his knowledge where he can do so with profit direct or indirect to the former case, and for the advancement of his calling in the latter. This train of thought has induced me to devote an early morning hour to a few remarks on the profitable aspect of Strawberry culture, especially with regard to the prospects for another season.

First in importance is the selection of varieties,

rejection of those proved useless or inferior to others of later introduction. Apart from all cultural attention and skilful method, a great deal of the grower's success will depend upon the varieties he deals with, very much more indeed than those outside the Strawberry trade have any idea. There are certain qualities absolutely indispensable in Strawberries, and foremost of these are firmness, colour, and productiveness. Soft fruits are so extremely wasteful and profitless, that however fine their appearance may be, they should be vigorously discarded if disappointment and loss are to be avoided, that is why the quality of firmness has been placed first. My worst experience in this respect has been with Sensation, which in an average season is worthless, handsome though it be, but in very hot dry seasons it is more satisfactory; and it was an experience of that kind which led me to grow the variety more largely, with the result that in

become "smudged" like many sorts do after being gathered a few hours, render it a variety well worth note, and if it could be improved into a more reliable and productive habit it would be valuable.

If the colour is very light, as in James Veitch for instance, it is a disadvantage, this variety also possessing the bad quality of softness, though not in such a marked degree as those first-named; but the great size of the fruits recommends it to some, and certainly the public will buy large Strawberries when they will not look at small ones. There are several very dark Strawberries that are worthless, but a notable exception is afforded by the superb Waterloo, which, as a handsome late variety is unequalled, the peculiar fleshy character of the fruits and their distinct flavour rendering them favourites with nearly all who know them. Speaking generally, however, there is a prejudice against dark-coloured Strawberries, and the

profit, and it is not surprising that it has been so largely planted in the past year or two. The prominence of the seeds is a point against it, but this is not noticeable in large fruits; in the smaller fruits it is decidedly objectionable. In dry weather the fruits have also a tendency to become spongy, like Latest-of-All.

Flavour does not enter very largely into the consideration of the market grower, except when he may be supplying private customers or particular markets where high-class fruits are in demand. British Queen and Dr. Hogg still stand at the head of the best-flavoured Strawberries, but they do not suit the taste of all persons, and though I grow them both I do not find them any more profitable than other sorts, though both do very well with me. They are not of taking appearance, the light colour and the frequent defect of colour at the tips of the fruits giving them an un-

FIG. 33.—A GROUP OF ANTHURIUMS AT SHIPLEY HALL GARDENS. (SEE P. 118.)

three seasons out of four it is useless, and I have now finally rejected it. The dark colour of this Strawberry, though rich looking, is not the tint most liked by the public either. With regard to another comparatively soft fruit, Noble, I must say that its quality of earliness is a strong point in its favour, and though I would not advise anyone to plant it largely who had not tried it, as it varies greatly in different soils and situations, yet I am not prepared to reject it even in the face of its superior rival Royal Sovereign, for it is some days earlier with me, and brings considerable "grist to the mill" before the other is fit for gathering in quantity.

As regards colour, in my opinion, two varieties are pre-eminent, namely, Sir Joseph Paxton and Captain, and both also possess the qualities of firmness in a marked degree, though they differ in other characters. Captain is rather uncertain, it is not a large cropper, and is not much use except from young plants, but its bright scarlet colour, glossy surface, even-shaped conical fruits, which keep admirably and do not

tendency is to regard them as over-ripe, especially some of the smaller-fruited varieties, like Alice Maud.

An early variety that is not much grown deserves notice for its colour and productiveness, namely Scarlet Queen, the fruits are only of medium size, with a few large ones, but the flavour is fair, and the very bright uniform shade of scarlet is pleasing.

Shape and size are points to be considered in market Strawberries, and in these and several other qualities, Royal Sovereign takes first place. It is a magnificent variety, the fruits of good substance and flavour, excellent as regards the shape of the berries, and of large size, a grand variety for putting in punnets. The good opinions formed respecting this Strawberry are fully confirmed by experience. I have found, however, that there is a considerable difference between the first fruits and those from two-year-old plants, compared with later fruits and the product of older plants, the former being by far the better, both in size and colour. Still, it is a Strawberry to grow for

ripened effect. Many persons also prefer a brisker flavour, for after British Queen has been gathered a few hours in hot weather it is apt to become "mawkish." Elton Pine is one of the finest late varieties, excepting Waterloo, both in appearance and flavour, it is unfortunately not one of the most productive. If an acid Strawberry is wanted, Crescent Seedling will supply the requirement, and though the fruit is small it is produced in large quantities, is firm, and early. I have not found anything sweeter than Vicomtesse H. de Thury out of doors. Where I restricted to three varieties only, I should give the preference to Royal Sovereign, Sir Joseph Paxton and Waterloo, as the best Strawberries for punnets at leading prices. Latest-of-All gave me some hope one year that it would be a useful variety for late work as punnet fruit, but it has been very disappointing ever since, this year particularly so. The variety is, however, unquestionably one of the latest in cultivation, and it is worth attention in private gardens on this account. In one year I supplied sufficient for a

large party from this variety alone the third week in July, and it gave great satisfaction.

Eleanor, though an old variety, is not to be despised, both this year and last it has given very good returns, the fruit of even size, the colour bright, the fruit firm, and the deeply-indented surface gives a very distinct appearance.

It was intended when these notes were commenced to give a few observations on gathering, sorting, and marketing, but they have run rather beyond the limit; and another week I will, with the Editor's permission, give some details about the other points that may be useful to readers. *Fruit Grower.*

BOOK NOTICE.

LAWNS AND GARDENS. By N. Jönsson-Rose, with numerous plans and illustrations by the author. (London: G. P. Putnam's Sons.)

This is a treatise on landscape-gardening, beginning with a chapter on the study of natural scenery, passing on through successive sections to the implements made use of in surveying, the practical work of laying out and planting either in masses or as isolated specimens, the formation of lawns, rock-work, hedges, and the formation of orchards and kitchen gardens. The second part of the volume is devoted to a descriptive enumeration of the principal shrubs, trees, and herbaceous plants. The book is handsomely got up, is well illustrated with sketches from Nature, and has a good index. In the first chapter, on the study of natural scenery, the author runs a risk of confusing the study of natural scenery with the practice of landscape-gardening. Undoubtedly, the gardener who has used his eyes, and trained himself to enquire upon what conditions the phenomena of natural scenery depend, is in a far better position to do good work than one who has not had such training. The art of the landscape-gardener consists in the application of the knowledge that he has gained by the study of natural effects and of natural conditions to the circumstances before him. On the one hand, a servile imitation of Nature in a back garden is little other than preposterous. Adaptation to circumstances and locality, on the other hand, shows the taste of the artist, and leads to the most satisfactory results. In a garden we require the plants to grow in the most perfect way possible. In Nature plants have to grow how they can and where they can, and it is only occasionally that we can see them at their best. In Nature, too, we often meet with monotony when one species obtains and maintains the upper hand; but in landscape gardening of the best kind, we look for contrasted effects in one place, and reposeful harmony in another. A meadow full of Snowdrops, of waving Daffodils or Chionodoxa, is very beautiful in its place, but that place is not near the dressed garden nor in the immediate vicinity either of buildings or of "specimen" trees or shrubs. In such situations they call off the attention from objects of greater intrinsic importance, and destroy the restfulness and sense of space of the lawn. In the wild garden proper, or the Wilderness-walk, the conditions are very different. There one revels in the flowers, as in a wood full of Primroses in spring.

The work before us is written for American readers particularly, and the illustrations are largely of American trees and shrubs. Garden-lovers in any country will, however, find many useful hints in this handsome volume, and many subjects for discussion on matters of taste and opinion. The illustrations have the prime merit of accuracy so far as circumstances permit.

THE ROSARY.

THE WARS OF THE ROSES.

THESE are now over for the season, and like those engaged in the continental wars in the Middle Ages, the combatants have gone into winter quarters. The

custom then was, however fiercely they had been engaged, when the bad weather came on, fighting was suspended, not to be resumed until the following spring; and so now our combatants have laid aside their weapons, boxes have been emptied, tubes cleaned, and name-cards replaced in their receptacles, and what is left for us now is simply to review the past, and count on the possibilities of the future. There have been skirmishes over many parts of the field of considerable interest to those when the shows were held, but not really affecting the general character of the combat. The points on which the thoughts of most rosarians are centred are the three exhibitions of the National Rose Society.

The Show at Portsmouth.—These have been held under varying circumstances, and probably never since the society has held its three shows have their results been more chequered, for while that at Portsmouth on June 18 was the smallest the society has ever held, the Metropolitan one, held at the Crystal Palace, was the largest; and the Northern Show at Norwich exceeded in its strength most of those which have been held in northern towns. The reason for the smallness of the Portsmouth show are not far to seek: it was the earliest date on which the National has ever held a show, too early in fact in any year except for the Isle of Wight and other warm localities, but especially so in a season like the present one, which was not an early but a late one. Roses broke well after pruning, there was abundance of moisture in the soil (perhaps a little too much so for cold and clayey districts), and everything looked promising for a good Rose-season; but the long spell of cold and ungenial weather in May and the early part of June altered the face of things, and we evidently had to look out for a late and not for an early season—and therefore it was unfortunate that the fixture for the Portsmouth show was necessarily altered, because the day originally fixed was the one immediately following the Jubilee celebration, and the local authorities felt that they must put it backward and not forward. Moreover, one finds that alteration of dates does not answer as a general rule: the 23rd, originally fixed for the show, was a fine day; the 18th, on which it was held, was wet and stormy, the wind blew nearly a gale, but in such a place as Portsmouth it was not likely that any remissness would be found "in making all taut," and so no catastrophe like that which took place at York occurred here. As might have been expected, the most southern growers were very prominent; early as the date for the show was, it was not so early as the fixtures generally made by the Ryde and Isle of Wight shows.

Probably the most interesting part of this exhibition was the section for garden Roses; for many of these the earlier date answered well, and the collections exhibited by Messrs. Cooling of Bath, and Mr. Tate of Leatherhead, showed what could be done in both the professional and amateur classes. Captain Ramsey, who so energetically worked for the Society, had generously given a ten-guinea cup for the best twelve varieties: this was awarded to Mr. A. Tate of Leatherhead, for a superb box of blooms; so good were they that not only did they obtain this prize, but the two medal blooms for amateur classes were found in it, in Mrs. John Laing and Madame de Watteville. As these flowers were all grown under glass, they had a great pull upon those who cut from the open. The other two medal blooms in the nurserymen's class were a hybrid Tea, Lady Mary Fitzwilliam, exhibited by Messrs. Prior & Son (this variety used always to be accounted a hybrid perpetual), and Comtesse de Nadaillac, exhibited by Mr. George Prince, of Oxford—a flower of the usual high colour which he always manages to get into this fine Rose. Mr. B. R. Cant, Messrs. Prior & Sons, and Mr. F. Cant, occupied very prominent places. There was considerable disappointment as to the competition for the George Prince Memorial prize, as it was hoped that most of our leading amateur Tea-growers would have been competitors, but they were most of them conspicuous by their absence. The prize fell to the lot of Mr. Alex. Hill-

Grey, probably our most enthusiastic Tea-grower, and therefore one was glad to see that he carried it off, more especially as he and Mr. Prince were great friends.

The Crystal Palace Show.—If, however, the southern show fell so far short of our expectations and wishes, the great Metropolitan show at the Crystal Palace on July 2 exceeded, alike in extent, variety, and quality, any of its predecessors. It was the first time that it has been held on any day but Saturday, and of course to most of our exhibitors it was a pleasant thing to be able to get home quietly on Friday night and escape the bustle and inconvenience of the late arrival home on Saturday evening. It had, moreover, another good effect: on no day of the week is there such a throng of visitors as on Saturday, and consequently many, both exhibitors and visitors, were surprised at the ease with which they were able to get about and inspect the flowers. I cannot, however, say conscientiously that the general effect of the show was as good as in former years, and I think it never looked so well as when the long nave was given up to the Roses. The concert-room, too, where a large portion of the flowers were staged, has a very bad light at all times, and on a dull day like the 2nd of course the light is worse, and the amateurs who were relegated to this part of the building were loud in their disapprobation. Equally so, no doubt, would the professionals have been had this been allotted to them; but, after all, what place is equal to the Crystal Palace for an extensive exhibition of this kind? Tiring, no doubt, it is to those who have much to do on such days; boards are so much more tiring than the turf. So far as the number of the flowers was concerned, and the various quarters from whence they came, the exhibition was a remarkable one; in the larger classes we find the names of the old exhibitors recurring over and over again. One very pleasant feature of the show was the number of new exhibitors in the smaller classes, showing how well the plan of exhibiting according to the number of plants grown, introduced by Mr. Charles J. Grahame, has succeeded. In the amateurs' division Mr. E. B. Lindsell showed better than he has done for the last three years, and carried off the new Challenge Trophy, and most of the principal prizes for amateurs; he has a beautiful soil for Roses, and long experience, and also understands well how Roses may be best put up.

Messrs. Harkness & Sons took the leading position amongst nurserymen, and again carried off the Challenge Trophy, although they were run pretty close by Mr. B. R. Cant. Another feature in the show was the new Roses. For many years this was a most unsatisfactory exhibit. We were mainly dependent upon foreign Roses, and, owing to the severe duty which they had to go through in giving buds for propagation, they were mostly poor in quality; but now, when English raisers are sending out so many good new Roses, the case is entirely altered.

The stand for the best twelve was awarded to Messrs. Dickson & Sons, of Newtownards and Ledbury, and the flowers were exclusively those of their own raising. Amongst them was a beautiful pink Rose, with shell-like petals, called Ulster, which gained the Gold Medal of the National Rose Society for a new seedling; and the others in the collection were Daisy, Mrs. Grahame, First Cross, Bessie Brown, Mrs. Mawley, Mrs. W. J. Grant, Eileen Killarney, Lady Clanmorris, Tom Wood, and Countess of Caledon. Some of these, such as Mrs. W. J. Grant, are well known, the others are not yet widely distributed, but many of them are highly spoken of, and some doubtless will fall out of the ranks.

In the amateurs' prize for six new Roses, the same fact is observed, only two of them being of foreign origin. Besides these there were some that were either as sports or seedlings, which will most likely be useful entries as exhibition or garden Roses. Mrs. Frank Cant, shown by Messrs. F. Cant & Co., is another of those delicately-coloured, well-formed Roses which are sure to find favour. Mrs. Rumey is a pretty and useful garden Rose, and Messrs. Frank Cant & Co.'s sport from Suzanne-Marie Rodocanachi has all the good form and substance of that

favourite flower, but of a salmon-pink shade of colour. Of course, the Medal Roses are subjects of great interest to all rosarians, and the few to whom the lot of selecting has fallen know the great difficulty of the task. Sometimes one has wondered why the particular blooms have been selected, but in this case no such doubt could have arisen. The grand bloom of Muriel Grahame, by which Mr. Lindsell gained the Medal, was a magnificent flower, so also was that by which Mr. Orpen obtained the Medal for the best H.P. or H.T., Kaiserin Augusta Victoria.

The Medal blooms in the nurseryman's class were, I think, hardly equal to these, although one was glad that such well-established favourites as Horace Vernet, exhibited by Messrs. Harkness & Sons, and Madame Cusin, shown by Mr. B. R. Cant, obtaining the Medals. There were two features in the exhibition which, I think, did not come up to the wishes or expectations of the friends of the Roses generally—I mean the decorative classes. For the first time table-decorations, composed of Roses only, was introduced ;

Messrs. Paul & Son of Cheshunt, and Cooling & Son of Bath, were the only exhibitors in the nurserymen's class, and both their stands were worthy of all praise. Mr. H. V. Machin carried off Lord Penzance's Cup in the amateur division. In these connections many of the old favourites made their appearance, and also some newer varieties, such as Dawn, a pleasing pink shade of colour ; and Blanche Double de Courbet, one of the rugosa section, both exhibited by Messrs. Paul & Son ; while Messrs. Cooling had a very pretty bright Hybrid Tea, called Purity, which is likely to be very useful for both decorative and gardening purposes. Mr. Machin's stand was put up with the usual taste which he displays, and it was no small task to bring such a collection from so far north as Worksop, for they are a most troublesome class to carry. There is no doubt that this is a popular class, but I think at the same time the successful competitors in it must be always those who have large gardens. *Wild Rose.*

(To be continued.)

FIG. 34.—DENDROBIUM VICTORIA REGINA: FLOWERS SLATY-BLUE, WITH WHITE CENTRE.

and I do not think that the innovation is likely to be repeated. People are always praising the Rose as a subject for decorative purposes, but I cannot agree with them. For some few years classes have been introduced to encourage this, but I think that most persons will agree that they have been anything but decorative. The fact is, in my judgment, lightness forms one of the chief characteristics for a good stand of cut flowers. The exhibition-Rose is not a light flower, and the better and more perfect it is, the heavier it is ; and so the only way in which flowers in this class do show well, is when they can be displayed singly. I may say, so far as one's own use of flowers is concerned, we never use them for vases. Tea-Roses, cut with long stems, and used sparingly, may be the exception which proves the rule. The French are always considered to be our superiors in all these matters ; but I have a distinct recollection of a grand bouquet, sent by a *bouquetiste* in the Palais Royale to the Crystal Palace to contend for the prize, and an uglier exhibit I never wish to see. Garden-Roses, as usual, formed a pleasant and attractive feature, although the date was somewhat late for many of them, and they were certainly not so abundant as at Portsmouth ; indeed, they were the only classes in which all the prizes were not awarded, owing to the lack of competition.

ORCHID NOTES AND GLEANINGS.

DENDROBIUM VICTORIA REGINA, *Loher*.

OUR illustration (fig. 34), gives a representation of this pretty species, which was described in the *Gardeners' Chronicle*, June 19, 1897. The plants were sent to Messrs. Protheroe and Morris, who offered them on Friday, June 18 ; and therefore the proof of the correctness of the description, which purchasers look so anxiously for in the matter of a "blue Orchid," was not long delayed, for specimens of it have flowered in several collections, and have generally been considered satisfactory. The specimens vary somewhat, but all bear white flowers coloured on the outer halves of the segments with shades of blue. It is stated to be a native of the Philippines, growing at an altitude of 6000 feet. The plant from which our illustration was taken was exhibited by Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), at the meeting of the Royal Horticultural Society on the 10th inst., when it was given an Award of Merit.

A MONOCIOUS CYNOCHES CHLOROCHILON.

Amongst some imported plants of this species, one plant last year produced an inflorescence bearing two

female flowers, in appearance more flat than the common ones, and possessing a thicker and shorter column, but in colour almost identical. This year a strong growth produced two racemes, one of which bore two female flowers (which seems to be the usual number), while the other carried five male blooms, which, unfortunately, did not properly develop, though quite sufficiently so to identify the long, slender columns of the male flowers. The plant upon which this growth has been made produced thirty-five flowers last year, in a 6-inch basket, all of which were male. Mr. Rolfe has worked out this remarkable character of the genus, especially in the case of some species known to be monocious. In the pages of the *Gardeners' Chronicle* of 1891, p. 69, he mentions the receipt of female flowers from France. *R. L. H.*

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 63 to 69.)

4, MIDLAND COUNTIES.

(Continued from p. 101.)

OXFORDSHIRE.—Although the prospects early in the season for a good fruit year were very encouraging. Apples and Pears, with one or two exceptions, are a very light crop. Plums are an average crop. Apricots are thin, and a great many large branches have died-off. Sweet varieties of Cherries have carried a good average crop of fine large fruit, and very clean. Small fruits are a very heavy crop, especially Gooseberries, Black Currants, and Raspberries. Strawberries, although very much injured by the frost when in bloom, have been excellent in both size and flavour. Figs outside are carrying a good crop of extra-sized fruit. Nuts are very plentiful indeed, and Walnuts a good average. *A. G. Nichols, Nuneham Park Gardens, Abingdon.*

SHROPSHIRE.—The Plums, Apricots, and other stone-fruits, are nearly a failure here. Pears are below the average. Apples very variable; some sorts, such as King of the Pippins and Warner's King, are plentiful, while others have few or none. *James Loudon, The Quinto, Chirk.*

— All the Apple-trees with us and in our neighbour's garden were covered with blossom, and at one time looked very promising for good crops of fruit; but after the blights that occurred, only Codlins, Lord Suffield, Lane's Prince Albert, Ribston Pippin, and Bramley's Seedling set well. I may say that all varieties of Plums set very clean fruits; but the crop is under average. Some kinds of Pears have set fairly well, viz., Marie Louise, Beurré Bosc, Williams' Bon Chrétien, Beurré Diel, and some Bergamots. Shropshire is noted for Damsons, but this year there are very few. *Wm. Weeks, Cheswardine House Gardens, Market Drayton.*

— The frosty nights in the second week of May did considerable damage to the early fruit-blossom; Strawberries would have been a very heavy crop but for the frost killing all the first blooms, which would have been the largest fruits, consequently, the crop is under-sized; some of John Ruskin, on a south border, escaped, and began to ripen on June 2. Apricot-fruits were nearly all killed, some fruits half-an-inch in diameter were frozen through; Moor Park suffered the worst. Of Apples and Pears some trees bear a heavy crop; others have none. *G. Pearson, Attingham Gardens, Shrewsbury.*

STAFFORDSHIRE.—Apples are a very partial crop here this season. Keswick and Mank's Codlin, Hawthornden and King of the Pippins are a fair crop, but Blenheim, Cox's Orange Pippin, and late varieties are very thin indeed. Pears are a very poor crop. Strawberries fair crop, and good in quality. Raspberries are a very light crop. Currants, especially red, are very good, both in crop and quality. *John Wallis, Keele Hall Gardens.*

— Plums are very few. Damsons none. Raspberries very good. A few of the earliest flowers of the Strawberry were killed by late frosts. Early Pears, as Williams' Bon Chrétien, Princess, and Jargonelle had nearly the whole of the bloom destroyed by frost. The mid-season and late kinds escaped. Wall-trees which had had their spring covering removed, had most of the young fruits destroyed by the very late frosts. *Geo. Woodgate, Rolleston Hall Gardens, Burton-on-Trent.*

WARWICKSHIRE.—You invite me to tell you my story about the fruit crops. Why, sir! like the needy knife-grinder, I have none to tell. As to the hardy fruit in these gardens, the only redeeming feature was the crop of Strawberries, which was fine in quality and large in quantity; and it lasted well, considering the drought; luckily, we had heavily mulched them in good time. Whilst writing of Strawberries, a friend of mine, who had graduated in the gardens of the Royal Horticultural Society, and who is a man always well in advance of the necessary up-to-date point of horticultural gossip, asked whether I had heard of the "new London" way of growing Strawberries? "No," was my reply; "living in this out-of-the-way place, we never see any practice beyond our own; we trust to the fountain of our early tuition, and draw upon our inventive imagination when we wish to make a new departure." My friend then explained, that the new way was to plant new beds every year, and dig them down as soon as the fruit was gathered, i.e., never having a bed more than a year old. Upon this new London patent, I found I had already been practically though unwittingly infringing, and walked my friend to a plot which I had been treating in precisely a similar way. I believe there is something in it; from our plants so treated we gathered plenty of fruits of good quality. Apples and Pears, as compared with the crop of last year, may perhaps be described as miserable. There will be about enough Apples in this part of the country to provide us with puddings and pies until the arrival of our sure supply from over the Atlantic. One day lately I happened

to be travelling in a railway carriage with a Canadian Apple-planter. Looking out of the window, our attention was drawn to the usual mismanaged Warwickshire orchard. My friend described to me how they planted their trees in Canada, and followed on until they were brought to their fruiting stage, which is arrived at much sooner than in this country; finishing up by telling me how a London coachman, after saving himself some money, betook himself to Canada, bought land, planted it with Apple trees, which he grew, fruited, and sold to advantage; bought and planted more land. This he continued to do until he became quite rich, but not proud, for nothing pleased him better, my friend informed me, than on high days and holidays to don his London high-hat with the "badge," emblem of the coachman's dignity still upon it. How many of us, might I ask, with all our knowledge, would have pluck enough, like this coachman, to go and do likewise? Apple culture in England, with not many exceptions, consists rather in obtaining a few trees to plant on some small space of ground, to provide sufficient only to be able to send up a few dozen dishes to a Crystal Palace show, there to be seen once, but, as Edgar Allen Poe's raven said, "Never, never more." [If our friend would pay a visit to the district round Swanley, Farningham, Maidstone, and elsewhere in Kent, he would modify his notions with regard to Apple, Plum, and bush-fruit culture. Ed.] Of Pears, those which generally yield fairly well have this year scarcely any, viz., Marie Louise, Williams' Bon Chrétien, and Louise Bonne; whilst Huxley's Victoria, which last year stood me in such good stead, is again this year pretty fruitful. Being in the midst of great heat and drought, we are applying to our wall Pear-trees a heavy mulching of stable-litter, and a heavy drenching of water over all. Those beautifully-trained trees which have been figured in this paper I am anxious to retain in perfect health. Of Plums there is scarcely any, and the Apricot is not much better. The Walnuts are thin on the trees, the flogging winds having shaken off most of the embryo fruits. Hazel-nuts and Filberts promise well. Out-of-doors Peaches, where care has been bestowed upon them, are satisfactory; indoors these and Nectarines were never better, or the fruit finer. *W. Miller, Combe Abbey Gardens, Coventry.*

— The Apple crop in this district is very irregular and under average, only the varieties Keswick Codlin, Lord Suffield, and Lord Derby having fair crops of fruit. The fine desert varieties of Apples are almost fruitless, owing to the injury caused to bloom by easterly winds and frosts. Caterpillars have also made sad havoc with the trees. Pears, on the whole, are a good crop. Plums of all varieties are a failure; moreover, the trees are badly infested with aphids. All outdoor crops on this light soil are suffering from the continued drought. *Henry Thos. Martin, Stoneleigh Abbey Gardens, Kenilworth.*

— The Apple crop generally will be quite a small one in this neighbourhood; still, the varieties Stirling Castle, Keswick Codlin, Lord Suffield, and Golden Winter Pearmain show an average crop. Exceptional crops of Plums are found on Denyer's Victoria, Pond's Seedling, and Early Pro'fic. *A. D. Christie, Rayleigh Gardens, Alcester.*

(To be continued.)

DARWIN.

At the luncheon given at Shrewsbury in connection with the unveiling of the Darwin statue, as mentioned in our last issue, Sir Jos. Hooker made the following very interesting statement in proposing the toast of "The Memory of Charles Darwin"—a name which he could not mention without emotion on the present occasion; but he asked them to look back in their imagination to just sixty years ago and let him tell them of the genesis of the affection and reverence which he cherished for the memory of Charles Darwin. It was in 1838 or early in 1839 that he first knew of him through receiving from a friend of his (Sir Joseph's) father the loan of some sheets of the "Records of a Naturalist during

the Voyage of the *Beagle*," which work was then passing through the Press. He (Sir Joseph) was at the time hurrying through his studies at the University of Glasgow, in order that he might accompany, as a naturalist, Captain, afterwards Sir James Ross, in his projected voyage to the antarctic regions. Being engaged with hospital duties, he had little time to devote to the precious sheets, and so he slept with them under his pillow in order that he might read them in the interval between dawn and dressing. This he did with fascination; but he must add with despair of ever following, at however great a distance, in the footsteps of so admirable an observer and reasoner. A copy of the "Records of a Naturalist" was sent to him as a parting gift as he was on the eve of leaving England; but meanwhile he had once met the author, having been casually introduced to him in the streets of London by a shipmate who had sailed with him in the *Beagle*.

Very shortly after his return from the antarctic voyage in 1843, he received from Darwin a cordial invitation to visit him at his "inaccessible home" as he used to call it, at Down, adding that he had much to ask him about, in botanical matters especially; and, as he afterwards found, Darwin especially wished that he should publish some of the botanical results of the voyage. This "inaccessible home," destined to become the Mecca of so many a scientific and literary pilgrim in after years, was then 10 miles from a railway station. He (Sir Joseph) should never forget the frank and joyous reception that met him on his first visit to Down, damped though it was by finding his friend's health so impaired. They had much to talk over, having visited in many cases the same countries during their respective voyages—the Cape of Good Hope, Rio de Janeiro, St. Helena, Tasmania, New South Wales, New Zealand, &c., so that they felt like fellow-voyagers, forgetting the eight years that had elapsed between the dates of their respective cruises. It was, however, in the study at Down that their intimacy commenced and ripened. On the morning after his arrival on his very first visit, Darwin asked him to accompany him to his sanctum for the purpose of his (Sir Joseph) giving him some botanical information, the great scientist being especially engaged on the geographical distribution of animals and plants. And the following was a sample of how the day was passed on this and many subsequent visits. Mr. Darwin had always a long list of queries to put to him, sometimes collated months beforehand, the answers to which were distributed on slips of paper amongst a marvellous number of pockets, bags, and portfolios, that hung on the wall, or occupied racks by the fireside. This "pumping," as Darwin called it, went on for twenty minutes or half-an-hour, after which he stated that he was incapable of further mental exertion, and that he must rest till the time for his mid-day walk. They might ask him what struck him most forcibly about these exercises of his intellect; and, putting aside the marvellous amount of knowledge which he gained, they were Darwin's indomitable perseverance under bodily suffering, his command of all the available sources of knowledge in any given object of research, his vivid and strong grasp of the most difficult subjects, and his power of turning to account the waste observations, and even the blunders, of his predecessors and contemporaries; which power his (Sir Joseph's) friend, Sir James Paget, once told him was, he thought, one of the most striking of the many evidences of Darwin's genius. It is "dogged that does it," was a favourite expression with him, and so dogged was he that he had cited his very illness as being to his advantage, congratulating himself, for instance, on sleepless nights that allowed him to read off his continuous observations on the movements of his beloved plants. Such was his association with Darwin for forty years, during all which time he was his guide, philosopher, and friend. It only remained for him to join with them in rejoicing over the fact that the admirable likeness of his old friend, which the President had unveiled that day, had been obtained by the efforts of horticulturists; and when he considered how

much scientific horticulture owed to Darwin, this was as it should be; moreover, he felt well assured that could Darwin know that that tribute to his memory was, by those special efforts, placed in his birthplace, amongst the loved scenes of his early youth, he would regard it as the most prized of all the honours that had been or could be bestowed upon him. *Shrewsbury Chronicle*.

BEDDING IN BATTERSEA PARK.

BATTERSEA PARK, the product of the genius of the late John Gibbon, and covering the space once occupied by the Inn known as the Red House, so celebrated for its shooting matches, will always be

Aristolochia Sipho (popularly called "Dutchman's Pipe"). *Monstera deliciosa* here luxuriates on the sides of a tree.

A mixed border opposite a portion of the lake is very gay with stately Hollyhocks, interspersed with Fuchsias which are flowering well, a very dark-leaved *Coleus*, and edged with *Pelargonium Zelia*. A trellis-like arrangement of the old and well known *Clematis Jackmanni* in this quarter flowers magnificently.

Amongst some of the flower beds noted may be mentioned—mixed *Verbenas* flowering profusely, and some good varieties of the new dwarf *Cannas*—very striking with their *Gladiolus*-like flowers; other beds mainly devoted to *Cannas* are looking well. Very effective is a bed of mixed *Heliotropes*, forming a

Pelargonium, throughout which freely peeps a rich blue *Viola* with small yellowish eye.

In a spot embowered in a wealth of trees, therefore taking off the otherwise overpowering colours, is a very large circular-shaped arrangement on the grass, the side representing a shield-shaped bed gay with *Pelargoniums*, *Lobelias*, etc. Too free a use is made of the Golden Feather for edging. The witty Sydney Smith was asked once if he could bury a Dissenter; his reply was that he would be quite willing to read the service over all of them. On the same principle, one would like to bury all the Golden Feather!

The beds on the level in this particular arrangement are composed of well-flowered *Pelargoniums*, *Fuchsias*, etc. Fine examples of *Succulents* planted here have also the desirable effect of toning down the bright colours. The condition of the Park entitles Mr. Coppin, the Park Superintendent, to much credit. J.

THE GROWTH OF TROPICAL FRUITS IN MADEIRA.

(Continued from p. 311, vol. xxi.)

AMONGST the species of *Anona*, or Custard Apples, grown in Madeira, the *Cherimoyer* of Peru (*Anona cherimolia*) appears to be the favourite, both with the residents and the visitors to the island, and it is considered by the medical faculty to be a wholesome and nutritious food for invalids, when eaten in a thoroughly ripe condition. The size of the fruit varies greatly; the ordinary size is about 4½ inches long by 3½ inches broad, but the choicer fruit, which is that mostly exported, is from 6 to 7 inches in length, and of a proportionate diameter. These larger fruits attain a weight varying from 1½ to 2 lb., and as a rule they are the choicest and best flavoured, fetching a much higher price than the smaller or medium-sized fruit. When ripe the fruit is of a pale green colour. It has a very thin skin, covering the pulpy or edible portion, which envelops a number of hard, black, almond-shaped seeds. The choicer varieties contain fewer seeds and more pulp, but in the commoner sorts they are very prominent, and detract from the marketable value of the fruit. The Custard Apple is not grown in plantations or orchards; but every small garden contains one or two trees, which are usually grown from cuttings or seed, and having attained sufficient growth, are grafted in much the same way as fruit-trees are in England. The oldest and largest trees attain a height of about 20 feet. A full-grown tree in a healthy condition and properly cultivated will yield fully 200 fruits as an annual crop, and instances have been known where trees have given a profit of £5 per tree per annum, although this is an exception. Unfortunately, little or no attention is paid to the cultivation of any fruit trees in Madeira, and they are allowed to run in many instances from one season to another without either pruning or manuring, in consequence of which they are attacked by mealy-bug, from which the fruit, having no strength to resist, falls to the ground when about half grown—and these observations apply to nearly all the fruit trees grown in Madeira. On this subject the writer of the report says, "I am strongly of opinion that were a little more attention paid to the cultivation of this class of fruit it would amply repay itself, and probably show an increased return both in the quantity and quality of the fruit in the first season after being so treated." The export trade in this fruit is both limited and fluctuating, a small quantity goes to the London market, and there is also a small export trade to Lisbon; but by far the greater bulk of the fruit grown is consumed in the island, or is taken by passenger steamers calling at the port for fresh provisions. Were this fruit better known in England, the demand for it would probably be much greater than it is at present, and an impetus would be given to cultivate it in greater quantities. When gathered in a quasi-ripe condition, it matures in from seven to ten days, in the same manner as Pine-apples do; and there seems to be no difficulty on the score of packing.

FIG. 35.—*ARISTOLOCHIA ELEGANS*. (SEE P. 126.)

amongst for its sub-tropical bedding. For some time to come none of London's other public parks will be so suitable as this one for this form of gardening, all lacking more or less the shelter from high winds that is essential wherever tall, large-leaved, or tender tropical plants are plunged outside. At Battersea there is such a wealth of deciduous trees and shrubs, and such cool, green turf and charming "peeps" across the lake, that bright and glowing colours are toned down. The idea of flatness of surface, so objectionable but sometimes unavoidable, never strikes one. So beautifully diversified by hill and dale are the grounds, and the planting arrangements have been made with a view to providing picturesque effect, that the whole forms a charming living picture.

How delightfully cool and refreshing are the shady Fern-glades here! *Mosses* give a noble and tropical aspect to the surroundings, as do the *Palms*. *Pandanus Veitchii*, with its long, spiny leaf, looks well in the open. Near the margin of the water is

delightful groundwork to the well-known and noble-leaved *Brugmansia Knightii*, just passing out of flower. A striking bed is formed of *Celosia pyramidalis aurea*, associated with single-flowered *Begonias*, and *Lobelia pumila magnifica*, the whole over-arched with gracefully pendent foliage. Attractive too is a bed of *Fuchsia*, *Golden Treasure* mixed with the graceful *Chamaejasme diacantha*, and *Antennaria tomentosa* as an undergrowth.

Dactylis glomerata, elegant-leaved *Aralias* and well-flowered *Tuberous Begonias* make an effective bed. A good bed of foliage is produced by the old *Dracæna Draco* (introduced from the East Indies in 1640), with the much more modern and brilliant-coloured *Acalypha tricolor*. An imposing bed of *Ficus elastica*, with an undergrowth of darker-leaved foliage plants produces a good effect.

Abutilon Thompsoni, with its yellow and green foliage, makes a happy arrangement mixed with blue *Lobelias* and edged by *Fuchsia Meteor*. A charming effect is made with a block of silver-leaved

Guava (*Paidium guayava*). This well-known fruit, as grown in Madeira, is said to be of a very inferior quality compared with that of the West Indies, which the writer of the report attributes to neglect of culture rather than to any fault of soil or climate. In Madeira it is seldom used in a raw state, but is usually stewed, or made into jelly. The fruits are not exported to any extent, but small quantities go to Lisbon and other Portuguese possessions.

The Loquat (*Eriobotrya japonica*) is another fruit which is not exported, in consequence of its having to be eaten in a freshly-gathered state. It grows to great perfection in Madeira, producing clusters of fruits of the colour and size of an Apricot. It has a slightly sub-acid flavour, and is most refreshing in warm weather. It is used either raw or stewed.

The Mango (*Mangifera indica*) is grown in most gardens, but no attention is paid to its cultivation, the trees being seldom, if ever, pruned or manured, the consequence being that the fruit has greatly degenerated both in size and quality, the luscious fruit so familiar to those who have lived or travelled in India or the West Indies being quite unknown in Madeira. As grown in the island, the fruits vary greatly in size and quality, the bulk of the fruit seldom exceeding in size that of a large Eogliah Plum. In the larger-sized fruit the stone or seed appears to gain in size out of proportion to the pulp or edible portion. The fruits are in greatest perfection, both as regards size and flavour, about Christmas, the season lasting from September to February. The trade in this fruit is a fluctuating one, the greater proportion of the crop being consumed by the residents of the island. Small quantities go to both the English and Lisbon markets. The Mango is a very suitable fruit for exportation, as it can be gathered in a fairly green condition, and allowed to mature in course of transit. It is usually packed in baskets, each individual fruit being wrapped in paper, and then packed in straw, the basket being covered with coarse canvas. The writer says, "It is much to be regretted that a fruit so highly valued by those who have eaten it in the East should have been allowed to degenerate to such an extent as it has done in this island, for were the best varieties of trees imported from India, and proper attention given to their cultivation, I am of opinion that the demand would increase as the quality improved, and any trouble that had been taken would be more than repaid by the higher prices that would be obtained for the finer quality of fruit."

It is interesting to note that the Melon-Pear, which was noticed in the *Kew Bulletin* for January, 1893, as a comparatively new introduction, flourishes in Madeira. The plant was introduced to this country as *Solanum guatemalense*, but its correct botanical source was proved to be *S. muricatum*, Ait., a native apparently of Peru. Grown under glass in this country the fruit seems to have but little to recommend it, but in California it is said to be a very refreshing fruit, almost equal to a good Melon. It would therefore seem to be suitable for open-air culture. It is stated to have been introduced about 1837 into Madeira, where it thrives luxuriantly. It is easily propagated by cuttings or layers, and yields a large crop of its oval-shaped fruits, varying from 4 to 5 inches long, and having a flavour, it is said, somewhat between that of a Cucumber and a Melon, the latter flavour being most prominent. At one time Melon-Pears promised to become an article of export, but the demand for them has long since died out, and it seems that no export has taken place during the last three years, notwithstanding that the fruits are easily packed, and carry without detriment.

The fruits of *Pasiflora alata* and *P. edulis* are cultivated to some extent in Madeira. The taste for these fruits seems to be an acquired one, and the English palate does not yet seem to have become educated to such an extent as to cause shippers to undertake their exportation, though there is no difficulty in packing nor in the keeping properties of the fruits.

COLONIAL NOTES.

ROYAL BOTANIC GARDENS, CALCUTTA.

THE failure of the past rains proved fatal to a number of plants, which had been weakened by the preceding drought of 1895-96. The conservatories, which depend for their water on the tanks in the garden, suffered most, since these tanks had to be supplemented with water from the river, and the quality of the water thus supplied was found unsuitable for the more delicate plants. The principal improvement effected in the garden during the year was the relaying of the avenue leading from the river entrance to the great Banyan tree. The opportunity was taken to open out several vistas by removing trees, and before the end of the year the improvement of the Clarke and Thompson avenues was taken in hand.

With regard to plants of an economic value, Dr. Prain, the Curator of the Herbarium, was engaged during last cold weather in making observations on Mustards. To provide samples, patches of the various kinds of Mustard cultivated in Bengal were grown in the Sibpur Experimental Farm. Dr. Prain's results, which are said to be of great interest both from a botanical and an economic point of view, will shortly be published by the Department of Land Records and Agriculture. The results of a similar series of observations on the different kinds of Wheat, which were made by Dr. Prain in 1895-96, have been recently published. There was a large demand from planters and other persons during the year for *Rheea* plants, the interest in the cultivation of which has revived. The indents were met as far as possible, and the *Rheea* field has been thoroughly cultivated and manured in case the demand continues. Dr. King observes that the real difficulty in respect of *Rheea* seems at present "to be rather in securing a supply of the raw material than in finding a process to deal with it successfully after it has been put on the European market."

The herbarium, as usual, received special attention, and 13,989 specimens were added to the collections during the year.

The second part of the fifth volume and the seventh volume of the *Garden Annals*, were issued during the year. The former consists of descriptions with figures of about 100 new or interesting species, while the latter comprises a monograph on the Indian species of Bamboos, by Mr. J. Sykes Gamble, Director of the Forest School, Dehra Dun, with a description of every species of Bamboo found growing within the Empire, and a summary of its uses. It also contains a lithograph of each species, with careful analyses of the parts of the flower, and thus supplies a long-felt want; since, owing to the infrequency of their flowering the Bamboos have hitherto been little understood, and the different species have been very imperfectly recognised. Both Dr. King and Dr. Prain also contributed valuable papers on botanical subjects to the *Journal of the Asiatic Society of Bengal*. The thanks of all botanists are due to the government for sanctioning the publication of these most valuable publications.

The Lloyd Botanic Garden in Darjeeling suffered severely during the year under review, first from the unusual drought, and subsequently from the exceptionally heavy rains, which at the end of July culminated in a storm which destroyed many trees and plants. The repair of the damage done absorbed much money, which would otherwise have been spent on improvements. The lease of the patch of ground belonging to the Darjeeling Municipality, which has for some years been worked as a vegetable garden, expired during the year, and it was decided that the land should be made over to the Government for incorporation with the garden.

Proceedings of the Agri-Horticultural Society of Madras, January—March, include a notice of the annual flower-show held last February. The season having been adverse, the exhibits were, on the whole, scarcely up to their usual standard. The other contents include mention of seeds and plants exchanged,

and Reports of Proceedings.—The Report of the Annual Meeting of the above-mentioned Society, held on March 29, mentions the work done during the year, and gives particulars of expenses and receipts.—*Annual Report of the Botanic Garden, Grenada*, by W. E. Broadway, Curator. This mentions the fruiting of the Orange known as Grenadine, and peculiar to Grenada. The variety is said to be somewhat large, and coarse in size and flavour, and of use for preserving. Coffee, formerly much in demand, is now ready, quantities of fine plants awaiting a suitable market. The general condition of the gardens appears to be highly satisfactory.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

Platylinis (Dendrochilum) fliformis.—This elegant plant is now flowering from half-developed growths, and is one of the chief attractions in the Orchid-house. Many growers, knowing it to be native to the Philippine Islands, conclude that the plant requires great heat; but experiments made at Burford have proved such treatment to be distinctly injurious. In the East-Indian house or plant-stove the thin, grass-like leaves become infested with a small species of red-spider. The best position for the plant at all seasons is a moist, shady corner in the intermediate-house, suspended near to the roof-glass; and if water be plentifully supplied to the roots whilst growth is in progress, and an occasional syringing given overhead, this pretty species will succeed perfectly. The plant will root freely in shallow, well-drained peat and sphagnum-moss; if it requires fresh material or more root-space, the plant may be repotted into Teak-wood baskets or pans as soon as the flowers fade. The spring flowering *P. glumacea* having completed its new growths, should be given a cool, shady position in the same house.

Epidendrum.—*E. Stamfordianum* should not be given great heat and moisture. It is now starting to grow from the base of the current season's flowering-stem, and it should be placed in a light, moist corner of the intermediate-house, as near to the roof-glass as possible, where it should be watered with care. Repotting may be done before the new roots appear. Give plenty of drainage-material, and elevate the plant well above the rim of the pot, using two-parts of rough fibrous peat to one of sphagnum moss. The well-known *E. radicans* (rhaphyphorum) has been in bloom for several months, and as the plants are starting their next season's flowering-growth, the present spikes should be removed. It is a plant of scanty habit, and many of the shoots that did not flower this season have grown somewhat long; these may be cut in lengths of about 2 or 3 feet, and tied to neat stakes, making them up into a specimen plant. The old growths and flower-stems frequently send out off-shoots, which may be taken off and inserted thickly around the edge of a pot in well-drained sphagnum-moss. Throughout the growing season *E. radicans* should be kept moist at the root, and be properly syringed overhead. Examine frequently the points of new shoots to prevent mealy-bug.

Odontoglossum-house.—Plants of *Miltonia vexillaria* may be repotted, but before this is done, closely examine each plant for small yellow thrips, which lodge low down in the axils of the leaves; if any are found, a little sulphur, dusted into the growths, will drive them from their hiding-places, and at evening fumigate the house with the XL Vaporiser, which will destroy them. This *Miltonia* should be given a larger surface-space to root in than most Orchids require; therefore, use rather large, well-drained pots, placing the plants into a shallow compost of three-fourths sphagnum-moss, one-fourth fibrous peat, and a moderate quantity of small crocks, well mixed together. Elevate the plants well above the rim of the pot. After repotting, water sparingly with a fine rose-can, giving just enough to induce the roots to grow. As the young roots commence to ramble in and out on the surface of the soil, a more liberal supply will be necessary. Keep the plants in their present quarters until the nights become chilly, when they should be removed to a cool position in the intermediate-house. Plants of *Chysis bracteosa*, *C. laevis*, *C. Limminghii*, *C. Sedeni*, and *C. Chelsoni*, that have up to the present time been growing in the Cattleya-house, should now be removed to a light position in the East-Indian

house, where they will quickly finish up their growths, and become properly matured during autumn. They still require plenty of water at the root.

THE FLOWER GARDEN.

By CHARLES HERRIS, Gardener, Dropmore, Maidenhead.

Bulbs for Bedding.—The earliest opportunity should be taken to order bulbs that will be required for planting-out in the autumn. Where masses of colour are desired, beds may be devoted entirely to one kind of bulb; but if a continuous display is aimed at, it is well to plant beds with a groundwork of some other subject, as Pansies and Violas or Myosotis, Primroses, and such like—the bulbs to be planted about 10 or 12 inches apart, and between the other subjects. The latter will continue to bloom after the bulbs are past, and until the summer bedding is put out. For massing or planting among other plants, the following single Hyacinths are well adapted:—White-flowered: Madam Van der Hoop, Mont Blanc, Mina, La Grandesse, Grandeur à Merveille. Blue: Charles Dickens, Lord Derby, Orondates, Grand Maître, Car Peter, Couronne de Cèla, and General Havelock. Dark purple-red: Lord Macaulay, Incomparable, Norma (pale pink), Robert Steiger, Fabiola, General Pelissier (crimson), Lord Wellington (bluish), Gigantea (rose), Queen of Hyacinths (bright rosy-scarlet). Yellow Hyacinths are generally not well adapted for bedding, and may be omitted.

Tulips.—Belle Alliance, brilliant scarlet, early and dwarf; Canary Bird, early yellow; Yellow Prince, bright yellow; La Reine, white, tinged with rose; Keizer Kroon, crimson-scarlet, edged with yellow; Joost Van Vondel, crimson; Comte de Mirabeau, white; Proserpine, rich dark rose, fine; Duchesse de Parma, red and yellow; Couronne Pourpre, rich dark, dwarf crimson; Prince of Austria, fine orange-red, late; Queen of Violets, light violet, large and distinct. Of showy double Tulips, the following may be named:—Gloria Solis, large reddish-brown, with yellow edge; Tournesol, red and yellow; Yellow Tournesol, bright golden-yellow; Murillo, pale rose; and La Candeur, white, rather late.

Narcissus, Crocuses, Chionodoxas, and Scillas should be included in considerable quantity in any spring-flowering collection of bulbs. If the Chionodoxa is planted about a rookery the effect is good, and they reproduce plants freely from seeds, self-sown.

Amaryllis Belladonna, the Belladonna Lily, should be purchased and planted now. If planted at the foot of a south wall, in light rich soil, and about 6 inches under the surface, they will flower freely for years, the bulbs will increase, and as long as freedom of flowering continues, it is not advisable to lift them. Established bulbs growing in a position as described above, are now throwing up numerous flower-spikes.

Yew and other similar Hedges should now be given their annual clipping. If cut at this season, when growth is completed, they require little extra attention throughout the year.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

Fig Trees.—Be careful that these are afforded sufficient water at the roots. Thin out surplus growths, pinching the points of those retained for yielding fruit next year at 2 feet length, allowing weakly-growing shoots to make a few inches more growth before nipping the points out. This, in addition to promoting the formation of embryo fruits, will cause a more equal distribution in the flow of sap. Secure leading shoots in position with nails and alureds. Where the walls are provided with wires fixed to eyes driven into the brickwork about 1 inch from the wall, the wires running horizontally at 9 inches apart, bands of raffia or bast should be used, care being taken in both cases to allow room enough in the shreds and ties for increased growth. A watchful eye must be kept on fruits approaching ripeness, otherwise birds, wasps, and flies will not only disfigure, but actually destroy many of them. Half-inch meshed netting, if placed over the trees, and secured pretty closely to the wall at bottom and top, and kept out a few inches from the fruits by forked sticks being placed between the wall and netting, will save the crop from being injured by the birds. Wasp glasses three-parts filled with sweetened beer and suspended at short intervals over the individual trees will entrap the wasps and flies. The glasses should be emptied occasionally, refilled with the syrup and put in position again. In addition to these wasp and fly-traps the old-fashioned, but

nevertheless effective, hand-light traps should be set under fig-walls, or, in fact, any part of the garden where ripe fruits—Figs, Plums, Pears, and Gooseberries—require protection from their attacks. Place a hand-light about one inch above the ground. Make a hole in the top of the cover, which is placed on the light, then drop another hand-glass and cover over the first one, and stop any spaces there may be between the frames of both glasses to prevent the escape of the wasps and flies which ascend to the "top story" as soon as they have feasted on the damaged fruit, which may be placed on the ground-floor as a decoy. The glass, excepting the hole in the top of lid of bottom hand-light through which the wasps enter the trap, should be whole. In addition to practising the above-mentioned measures with a view to saving any Figs from disfigurement of the kind indicated, I have placed the individual fruits of such large varieties as Castle Kennedy and Brunswick in muslin bags, made with a running-string at the top.

THE KITCHEN GARDEN.

By W. FORB, Gardener, Highclere Castle, Newbury.

Autumn-sown Onions.—If seed has not yet been sown the work should be done with little delay, as the young plants need to attain a fair size before winter sets in. It is equally important that the seed be not sown too early, especially after such warm weather as we have had recently. Germination will be rapid, and if the plants become too large before growth is checked, they are very liable to start prematurely to seed in the spring. If the soil be light and porous a dressing of salt may be given before sowing, and it will be of service in checking the attacks of grubs, &c.; but if this be naturally wet or of a heavy texture, apply a good dressing of soot and cinder ashes, the latter to be well incorporated with the soil whilst digging. Make the soil moderately firm before sowing. Drilling being generally preferable to sowing broadcast, draw out rows about 9 inches asunder and about an inch in depth. If young Onions have to be provided at all times for salad purposes, it is advisable to sow an extra breadth at this date for use through the autumn. The Roccos are general favourites for this sowing, the selection known as the "Golden Rocca" being the best in appearance and good in quality, a good selection of White Lisbon being useful for early work. Any bulbs still left over from last autumn's sowing should be taken up and harvested without loss of time, as they will now be forming fresh roots and will soon start into growth and be utterly spoiled.

Onions, Spring-sown.—Keep these free from weeds and rubbish. Press down the tops carefully with the back of a wooden rake, to check their growth and assist maturation. When growth is completed, pull them up and spread thinly on the ground, turning every day till thoroughly dry, when they should be removed to a dry, cool shed, and stored thinly till they can be tied in ropes or bunches. Those sown early in boxes under glass, and grown on for exhibition or other special purpose, will generally have attained their full size, and should be pulled up and laid thinly on a greenhouse stage for a few days, or failing this, in a cool, airy shed, where they will become thoroughly matured, and as a consequence keep much better through the winter and early spring. Do not leave them on the ground after pulling, if it is necessary to keep the bulbs sound through the winter.

Mushrooms.—Where Mushrooms are required through the winter, it will be necessary to commence collecting the materials for making the beds. To ensure a regular supply from November onwards, bed-making should begin in September, and if the droppings from three or four horses only are available, this must be collected daily, and spread thinly in an open shed secure from rain. Turn this over occasionally, and when sufficient has been collected, throw it into a heap to ferment and sweeten, turning every day for a week, by which time all rankness will probably have disappeared from the manure, the bed being then made according to former directions, and spawned at 70° or 75°. For a regular supply a bed should be made every three weeks through the autumn.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Leicestershire.

Melons.—Plants that will soon ripen fruits must be carefully watched, withholding water until the leaves show signs of flagging. If they be given much water at this stage, the fruits will be poor in flavour, even

if they do not crack. Give air freely during favourable weather, and regulate the growth as required. Plants carrying fruits about to swell may be top-dressed or given a little manure-water at a temperature of 90° to 95°. Keep the laterals pinched, and close the house early after a good syringing, allowing the temperature to run up to 95° or 100°. Avoid cold draughts when ventilating, especially in the morning. Later plants that will ripen fruit in October will need the growths tying in, and all side-shoots should be rubbed off till the trellis is reached. After this, allow just sufficient to furnish the wires. Stop the shoots one leaf beyond the fruit, and as the flowers open, keep the atmosphere a little dryer, and pay careful attention to fertilisation. Keep the bottom-heat as even as possible at about 85° by adding a few additional leaves or otherwise. An odd plant or two may still be put into pots if very late fruits are desired.

Vines.—Early houses from which the fruit has been cut, containing trees that have to be started very early, may have all superfluous growth thinned out, leaving just the main shoots shortened back to about half-a-dozen leaves. By this means the buds at the base will plump up, and the Vines will benefit generally. Do not let them suffer from being too dry at the roots. Syringe them occasionally to keep the foliage clean and healthy as long as possible. Keep houses containing ripe fruit cool and airy. Vines in later houses should be looked over frequently, and all bad berries removed. Keep the lateral growth in check by occasionally removing a little. Make ready the tiffany, Nottingham netting, or whatever material is used for the purpose of preventing injury from wasps. Nottingham or hexagon netting is the best, as it admits much more air than the ordinary tiffany.

PLANTS UNDER GLASS.

By G. H. MAYOOR, Gardener, Luton Hoe Park, Luton.

Cyclamen.—Bulbs of last year that have been at rest during the summer in cold frames should be potted-up without delay. Use a compost of two parts fibrous loam, one of leaf-soil, one of decomposed manure, and a liberal addition of sharp silver-sand and charcoal. Clean the bulbs from the old soil, and pot them direct into the flowering-pots, which should be those about 7 inches in diameter for good-sized bulbs. When re-potting has been finished, place the plants on inverted pots in a cold frame, and syringe them once or twice on all bright days. Fumigate frequently to prevent thrips.

Cinerarias.—The earliest plants now require their final shift into 6 or 7-inch pots. Afterwards the plants must be shaded, unless the aspect be a north one, and the atmosphere kept moist. Pot-on successional plants before they become root-bound, and keep green fly in check by fumigating occasionally, for which the house should be prepared by keeping it drier.

Herbaceous Calceolarias.—Prick off plants from the seed-pans as soon as they are large enough to handle, putting them into 2½-inch pots. The compost should be a little stronger than that recommended to sow the seeds in. Give them a north aspect, and sufficient room that air may freely circulate between each. I do not recommend fumigating these Calceolarias during the first stages of growth, as the young, tender leaves often become injured by it. On the first appearance of green-fly, remove the pest by means of a camel's-hair brush.

Vallotas.—These pretty bulbous plants do not require to be potted frequently, but if this has not been done for several years, the present time will be a suitable one for carrying out the work. Prepare a mixture of three parts good loam, one of leaf-soil, and one of sand. Shake away the whole of the old soil from the bulbs, and put five or six of the largest into a 6-inch pot, or more in proportion to the size of the pot it is intended to grow them in. Keep the bulbs well down in the pots, and do not give much water until the flower-spikes are seen. Afterwards they will require much the same treatment as Hippeastrums.

Winter-flowering Begonias.—Give liberal waterings with weak liquid-manure, and keep the plants steadily growing in a position near to the glass. B. socotrana that has been at rest during the summer should now be shaken out and re-potted. This does best in small pots of 4 to 5 inches in diameter; and if it be desirable to increase the stock, place two or three of the little bulbils into 3-inch pots, which, if not potted on, will make small but pretty plant

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	AUG. 24.	Royal Horticultural Society's Committee, at Drill Hall, Westminster.
		Royal Oxfordshire Horticultural Society's Show, at Oxford.
		Brighton and Sussex Horticultural Society's Show (two days).
WEDNESDAY,	AUG. 25.	Kingswood Horticultural Society's Show.
THURSDAY,	AUG. 26.	Swansea Horticultural Society's Show.
FRIDAY,	AUG. 27.	Royal Horticultural Society of Ireland's Show.

SALES.

MONDAY,	AUG. 23.	Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs and Lilies, at Stevens' Rooms.
WEDNESDAY	AUG. 25.	Dutch Bulbs and Lilies, at Stevens' Rooms.
THURSDAY,	AUG. 26.	Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	AUG. 27.	Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three years, at Chiswick.—61°.

ACTUAL TEMPERATURES:—

LONDON.—August 18: Max., 78°; Min., 59°.

PROVINCES.—August 18 (6 P.M.): Max., 66°, at Margate; Min., 53°, at Sumburgh Head.

A HYBRID *Aristolochia* is a novelty, so much so that we can find no record of one, albeit the structure of the flower would lead one to suppose that hybridisation by means of insects must occasionally occur. The new-comer is not only a novelty, but as the figure shows, it is decidedly a good-looking one. Mr. J. M. BELL, gardener to Rev. Canon PRETTYMAN, Louth, is to be congratulated on his success, and on the very interesting addition he has made to our stove climbers. We learn that the hybrid in question was raised out of *A. brasiliensis* by pollen of *A. elegans*.

"To get at," says Mr. BELL, "the stigma, I cut a triangular piece out of the perianth, and having applied the pollen, fixed the bit down again with floral gum. I was delighted to see next day that fertilisation had begun, and by September the seeds were ripe. I sowed in March, 1895, and in a month they germinated well. I kept a good stock, part of which went to Orwell Park, the remainder I destroyed. During the summer the seedlings made but little progress. Some would show signs of growing well, and without any apparent cause would die. I kept one alive, and this year it began to flower. I then had procured a plant of *A. gigas Sturtevantii*, which has grown well, but never flowered. In pruning last spring I kept a half-ripe piece of wood, and grafted it on a plant of *A. elegans*, and, curiously, this has flowered three times. The first time soon after grafting them the plant rested, broke strongly, and again flowered, rested once more, and is now once more in flower."

The parent plants of the hybrid belong to two very distinct sections of the genus. In the section to which *A. elegans* belongs, the perianth expands above into a broad, shield-shaped limb, the upper portion of which is much larger than the lower, although it is not

divided into an upper and a lower lip (fig. 36, p. 127). In *Aristolochia brasiliensis* the limb of the perianth forms two distinct lips, the upper long and folded in the middle, the lower much larger, like the lip of an Orchid, provided with a stalk and with two rounded horizontally-spreading lobes crumpled like a Poppy petal, cream-coloured, with a thick network of purplish spots.

In the hybrid the perianth, including the tube, is about 8 inches (20 cent.) long, the distended tube about 2½ inches (7 cent.), creamy-yellow with purplish blotches along the nerves. The lip, which is so important a feature in *A. brasiliensis*, is here obsolete. The upper lip is intermediate in shape between that of *A. brasiliensis* and that of *A. elegans*, about 4 inches long (10 cent.), 7 to 8 cent. in greatest breadth, oblong, retuse, slightly crumpled, cream-coloured, thickly bestrewn with arborescent purplish spots; the throat of the perianth is clear yellow, as in *A. elegans*, with numerous purplish radiating veins. The interior of the ventricle or distended position of the tube is covered with fine downy hairs; at its junction with the tube it has on one side a thick fleshy cushion-like prominence, beneath which are two patches of very dense purplish hairs, as in *A. brasiliensis*. The staminal column at the base of the ventricle is erect, about a quarter of an inch (6·7 mill.) long; lobes oblong-obtuse, anthers linear, resembling those of *A. brasiliensis*. The leaves, too, are like those of *A. brasiliensis*, but less glaucous.

Orchids.*

OF the numerous publications with which LINDLEY enriched botany and horticulture, none has more permanent value than the "Genera and Species of Orchideous plants." Well arranged, with clear, concise, characteristic descriptions, orderly synonymy and useful notes, from which all verbiage and unnecessary discussion are removed, it was at the time of publication a model monograph. The last sheet is dated October, 1840; the publication of the work having been commenced in April, 1830. Since that time the knowledge of Orchids has enormously increased, mainly in consequence of their general cultivation. Horticulture in this case has greatly added to the resources of botanists. At that time there were but few species grown; now, as we all know, the numbers are vast. Some species are even threatened with extinction—a calamity partially compensated for by the greatly extended knowledge of their structure and habit, which cultivation has rendered possible. ROBERT BROWN, the two HOOKERS, BRONGNIART and others have greatly added to our stores of knowledge. REICHENBACH devoted his life to their investigation; he published much, but became overwhelmed with detail, and left no general synopsis, unless indeed, which is not very likely, it be shut up in Vienna with his herbarium. In recent times BENTHAM completed a masterly survey of the genera of the order; Sir JOSEPH HOOKER has quite lately elaborated the Orchids of British India; COGNIAUX is engaged on those of Brazil; and PFITZER, relying more than his predecessors on vegetative characters, has rearranged the genera in a manner that has been followed in some recent books to the terrible multiplication of synonyms. ROLFE has published largely on the order of late years in the *Journal of the Linnean Society*, in these columns,

* *Orchidacearum Genera et Species expositis*, Frits Kraenzlin Vol. I., fasc. I. (Berlin Mayer & Müller.

and in those of the *Orchid Review*. It is also generally understood that Mr. ROLFE is collecting material for a new "Genera and Species of Orchidaceous Plants." As Mr. ROLFE has all the resources of Kew at his disposition, it is clear that he is particularly well placed for the prosecution of such a work. Some preliminary monographs have already been published by him, such as the revision of *Apostasieae* and *Cypripediæ*, published last year, but which is not, as far as we see, referred to by Dr. KRAENZLIN in the fascicle before us. This fascicle contains sixty-four pages, the number of species described being about the same number. As it is estimated that some 5,000 species are now known, the reader will be able to form an estimate of the number of fascicles that will be required to complete the work.

Dr. KRAENZLIN begins appropriately enough with the *Apostasieae*, which, with their simpler and more regular structure, form morphologically the introduction to the *Orchidaceae*. They are exceedingly interesting to the student, but not highly esteemed by cultivators. Dr. KRAENZLIN'S method is to enumerate the genera, supply references to the literature, and then to give a Latin description. After this follows a "clavis specierum," the value of which can only be tested by actual trial, and then the full description and synonymy of each species in Latin, with explanatory notes in German.

The *Apostasieae* are not very numerous, and we turn with some anxiety to the genus *Cypripedium*, of which fifty-five species are described in the present instalment, and here we are relieved to find that Dr. KRAENZLIN accepts the genus mostly in the old Linnean sense, and in that which was adopted in the *Genera Plantarum* of HOOKER and BENTHAM. Thus, the *Selenipedium* and *Cypripedium* *Selenipedilum* and *Paphiopedilum* of some authors either disappear or are adopted, properly enough, as sectional divisions. Orchid growers have their rights, like other people, and we think they are quite justified in protesting against the wholesale changes of nomenclature which the adoption of *Paphiopedilum* necessitates. The folding of the leaves in the young state, the number of compartments in the ovary, and the nature of the seed-coat, no doubt constitute an aggregate of characters useful for sectional divisions. Their adoption as generic characters involves changes, the inconveniences attaching to which are by no means outweighed by a supposed more perfect arrangement.

On the other hand, Dr. KRAENZLIN'S notions of affinities are peculiar, one illustration of which we may give by stating that *Cypripedium* *Rothschildianum*, now generally considered the same as *C. Elliotianum*, is placed in one section, while *C. Elliotianum* figures in another. *Uropedium* *Lindenii*, as has been shown in these columns, is a peloriote form of *C. caudatum*, and should hardly be cited as a variety of *C. caudatum*. Other species have apparently wandered away from their next affinities, as they are generally understood. More use might, perhaps, have been made of the form and appearances of the staminode, which we have found useful in determining species and as a guide to the parentage of hybrid forms. Some appearance of hasty publication is also shown in the erroneous citations, such as Barton Fl. N. America for *Paxton's Flower Garden*, in the want of uniformity in citing the references, and in the punctuation.

A concise and accurate revision of this large and important family is one of the greatest

wants of systematic and particularly of horticultural botany. Dr. KRAENZLIN's book cannot be concise, but it should be as accurate as circumstances will allow. By the time it is finished, perchance the Reichenbachian herbarium will be unsealed, and—What then?

and present *employees* of Mr. ARNOLD ALDRIDGE, of Manor Farm, Petersham, gardener and horticulturist, were present at a supper given in honour of Mr. ALDRIDGE's diamond jubilee in business. It was in 1837 that he first commenced business, and many of the hands thought the present year a fitting occasion to present him with a framed and illuminated testi-

evening complimentary speeches were made by the chairman, the vicar of Petersham, Mr. GROVES, Alderman MARSH RAY, M. HOF (of the foreign section of the firm), and Mr. J. ALDRIDGE.

THE SHREWSBURY SHOW.—The severe gale and destruction of exhibits at the York Gala has

FIG. 36.—THE FIRST HYBRID ARISTOLOCHIA. AN, ANTHER; ST, STIGMA. (SEE P. 126.)

A LECTURE ON PLUMS will be given by Mr. A. H. PEARSON, on Tuesday next, at the meeting of the Royal Horticultural Society, in the Drill Hall, James Street, Westminster.

PRESENTATION TO A HORTICULTURIST.—A gathering of a unique character took place on Saturday evening at the "Dysart Arms," Petersham, near Richmond, when over a hundred of the past

monial of the esteem in which they held him, and also with a lounge chair. Mr. JAS. WALKER, of Church Farm, Ham, Surrey, presided; and besides the guests of the evening, Mr. ARNOLD and his sons, there were present the Rev. W. H. OXLEY, vicar of Petersham, Alderman MARSH RAY, Mr. C. E. BEACH, J.P., and a large number of local tradespeople. The presentation was made by Mr. UZZELL, on behalf of nearly one hundred men; and during the

found a counterpart at the Shrewsbury Show held during the present week. Fortunately it did not occur on the morning of the exhibition, but at about mid-day on the previous day. It resulted in the complete collapse of the immense marquee in which the groups and the collection of large plants were at the time being staged. The injury done under this section was considerable. Messrs. CYPHER and FINCH appear to have been the greatest sufferers, sev-

of their specimens being irreparably damaged. Another marquee was also blown over, but this does not appear to have contained any exhibits. One of the many refreshment tents also suffered considerably. The gale appears to have blown from the west throughout the previous night, terminating in a sudden cyclone, reaching from Ruabon on the west on to Shrewsbury and eastwards to Stafford. Had the gale been one day later, the results must have been disastrous. This is the second occasion on which Mr. J. CYPHER has been a sufferer this season, he having also been an exhibitor at York. Previous to the catastrophe at Shrewsbury, it is said Mr. CYPHER, from past experience, cautioned the men in charge of the marquee in question in sufficient time to have averted in some degree the wreck which ensued, but his advice does not appear to have been acted upon in time. The executive at the Shrewsbury Show, under the energetic guidance of the Hon. Secs., Messrs. ADNITT and NAUNTON, immediately set to work to erect other tents, and thus much inconvenience was averted. Subsequent information, detailed in another column, shows that the exhibition was a great success, the display of fruit and vegetables being extraordinarily large and correspondingly fine in quality. The ornamental groups were also of great beauty. The visit of the deputation from the Royal Horticultural Society has given great satisfaction, and the Council will have had an opportunity of seeing how they do things at Shrewsbury. Mr. MCINDOR, whose portrait we give on p. 129, may be congratulated on the triumphant way in which he has illustrated by his fruits the care and skill of the British gardener. See also page 134.

BICOLOR GLOXINIAS.—Mr. SMITH, gr. to H. J. CLATWORTHY, Esq., Weston-super-Mare, sends us a flower of a Gloxinia in which the two upper lobes of the corolla are of a deep violet colour, whilst the three lower lobes are rosy-pink. The tube is wholly white. Mr. SMITH says that all the flowers on this particular plant are two-coloured in this way. We have never before seen anything of the kind in Gloxinias, and advise our correspondent to keep the plant and save seed from it.

THE KING OF SIAM.—On Sunday morning His Majesty King CHULALONGKORN, accompanied by Prince SAMPASANT, Baron SUNTHORN, and other members of his suite, paid a visit to Mr. WILLIAM BULL's establishment, King's Road, Chelsea. A visit was also paid to the Nurseries of Messrs. J. Veitch & Sons.

MR. A. M. ELCOMBE, of the firm of ELCOMBE & SON, Seed Merchants and Nurserymen, Romsey, has been appointed a Justice of the Peace for the borough of Romsey.

SOCIETY OF JERSEY GARDENERS.—The annual picnic of the above Society was held on Monday, August 9, when about seventy members and friends gathered together at 1 o'clock at St. Helier's Wharfedale for a drive to Bonley Bay. Proceeding through St. Lawrence Valley, with its shady lanes, the first halt was made at St. Ouen's Manor, the beautiful grounds of Col. MALET DE CARTERET. This is one of the oldest ancient houses and grounds in the island. From thence to Creux Moie, or what is more commonly known to visitors as the Devil's Hole, and home in the evening.

ROSES IN THE PRINCIPALITY.—We had recently the pleasure of a visit to the nursery of Mr. STEPHEN TRESDER, situate about a mile out of Cardiff. Hardy trees and shrubs, Conifers, &c., are grown here, but the specialty consists in the Roses. Some of the Teas are planted between great Privet hedges 8 or 10 feet high, which serve to protect them against cold east winds, very prevalent in the district in late spring. Both these and others in the open had made most satisfactory growth, and were exceedingly healthy. The nursery is not a large one, and the space being limited, only the very best varieties in each section are grown. Hybrid perpetuals and Noisettes, like the Teas above referred

to, were looking well. Mr. TRESDER showed us a white Tea, which he described as a sport from Anna Olivier. The sport occurred in this nursery a year or two ago, and, like most sports, in every particular but colour of flower it appears to resemble the parent plant. The blooms are very pretty, slightly lemon-coloured in the centre, and the plants were covered with them. Mr. TRESDER has a great opinion of Medea, a Rose sent out by Messrs. W. PAUL & SONS a few years since. The nursery stock generally exhibited first-class cultivation.

FLOWER-CULTURE IN SCHOOLS.—A very interesting addition has been made to the work of the Agricultural and Horticultural Association, which has done so much to promote "gardens of taste," by establishing industrial flower-shows. The new effort aims at reaching the children in our public schools. During the past spring the Council of the Association commenced by offering prizes for the culture of pot-plants to the children in twenty-seven London schools. Prizes were offered for every class, as well as for each school. The flowers to be grown were Tom Thumb Nasturtium, Candytuft, Ten-weeks Stock, German Aster, Virginian Stock, and Godetia. The prizes consisted of garden-tools, floral certificates, and bound copies of the Association's Annual, "One-and-All" Gardening. Each little competitor was supplied with the necessary seeds and very detailed instructions for carrying out the work, a nominal charge of one penny being made in each case, to give the children a personal interest in the success of their attempts. No fewer than 1627 competitors entered, and the results were exhibited in twenty-seven little flower-shows before the recent breaking-up for the holidays. So much interest and enthusiasm was shown, that Mr. EDWARD OWEN GREENING, at whose instance the experiment was made this year, hopes to see a great development of the movement in future years.

PRESENTATION TO MR. O. THOMAS, FROGMORE.—On Saturday last an interesting ceremony took place at Frogmore, when the foremen and young gardeners presented Mr. THOMAS (Her Majesty's Head Gardener) with a handsome silver waiter, and an address of congratulation on his silver-wedding day. The movement originated with the foremen, who wished (as a body) to acknowledge Mr. THOMAS's kindness and courtesy, also his assistance and encouragement to the young men in various ways. Mr. J. CHANNELL, as Chairman of Committee, introduced the subject for which they were assembled, and called on Mr. T. EDWARDS (Hon. Sec. and Treasurer) to read the address. This, after offering their congratulations to Mr. and Mrs. THOMAS on their silver-wedding, stated how gladly they availed themselves of the opportunity to testify to the invariable courtesy of Mr. THOMAS to his men, and of the respect and esteem in which he was held by them, also to assure him that this was a spontaneous expression of their feelings, and an acknowledgment of much kindness. Mr. THOMAS, in reply, said it certainly was most gratifying to him, and he could not adequately express his thanks, or say how much he appreciated their kindness. He assured them he should always look back on that day with pleasure, and value their handsome present, as would each member of his family. Rising again shortly after, Mr. THOMAS said he wished to propose the health of his foremen, and was glad of the opportunity of stating how well he was supported by each in their various departments. Whatever may be thought by others, he could say that the duties of the foremen here demanded constant attention, and that the position of those in authority in the Royal Gardens was no sinecure.

HOME CORRESPONDENCE.

JAPANESE BAMBOOS.—I have received from Japan this spring two Bamboos which appear to be new to western gardens:—1, *Phyllostachys fulva* (Japanese name, Ogon chiku), a *Phyllostachys* of the

same type as *P. nigra*, not yet sufficiently advanced for me to be able to describe it in detail, promises to be very ornamental. 2, *Arundinaria Metake* (Japanese name, Kanéyama Daké or Shakutan chiku), a dwarf species closely allied to *Arundinaria Veitchii*. Both these species should, from their geographical position in the Japanese Islands, prove hardy in the average English climate. A. B. Freeman-Milford.

ROMNEYA COULTERI is very fine here this season. There have been scores of bloom out at the same time, and it is quite hardy with us, having been planted five years since. It flowered well last season, but not so abundantly. It grows at the foot of an east-aspect wall, and has no other protection. In this situation it has withstood 28° of frost, and I think such a beautiful plant should be more generally known and cultivated. Thos. Denny, Down House Gardens, Blandford.

GERBERA JAMESONI.—This fine Composite has been flowering for some time past in the Edinburgh Botanic Gardens, where, until lately, it has been grown in a pot. It produces freer growth, however, and is more floriferous when planted in a warm border. If placed in a border with a sunny exposure against a building, and protected in the winter, as is the case at Cambridge, where it succeeds so well amongst hardy Cacti, an abundance of its scarlet inflorescences is produced. Under cultivation, the ray-florets are said to lose a great deal of their intense colouring, though they are still among the brightest of such flowers. [The colour is variable. Ed.] R. L. H.

FROST IN JULY.—I can assure "E. M." that my glass was in perfect order at the time, and also that vegetation showed decided signs of frost, but that being so dry at the time very little harm was done. John Kitley, Castle Nursery, Warwick.

THE CHERRY PLUM.—There are several trees of the Cherry Plum (*Prunus myrobalana*) growing in the orchard here, and I am told that seldom do the trees fail to bear fruit. Frequently the branches are so heavily laden that support has to be used to prevent their breaking off. This season the fruit is very fine indeed. We have both the red and yellow varieties, and if the fruits are not first-rate for dessert, they make splendid tarts or preserve. In a season like the present, when plums are very scarce, they are most useful. Never have I seen the Cherry Plum so fine. The soil is resting on chalk, and we are situated about a mile from the sea. The sprigs of fruit forwarded I have sent to bear out my remarks, and which I think you will agree are very fine. H. Markham, Northdown, Margate. [Could hardly be more heavily cropped. Ed.]

THE FRUIT FAILURE.—I read Mr. Blackmore's note respecting the causes of the general failure of the season's fruit crop with much interest, because his view corresponds so exactly with that I have endeavoured to express elsewhere. Nothing is easier than to set down all our troubles to frosts and cold winds, but if these certainly very unwelcome visitations did all the harm to the spring bloom attributed to them, how came it that the harm was so partial and so erratic? On the frost hypothesis I have been puzzled to understand why some trees should not have set a bloom, and some others close by have carried heavy crops of fruit. Of course, it may be said that Mr. Blackmore's hypothesis should equally apply to all trees; but then my experience has been that whilst surface-rooting and comparatively young or free-growing trees have little fruit, old, or large, or somewhat checked or stunted trees, especially those having deep roots, have fruited very well. Clearly it is a matter that needs elucidation, and Mr. Blackmore, in showing how the buds last autumn were active, growing trees were demoralised, those on old or deep-rooted trees suffering nothing, comes nearest to that elucidation. Then again we had a wonderful flush of bloom. Pears were specially floriferous; indeed, in passing by train I could but notice that Mr. Blackmore's trees were such showy masses of bloom as I had never before seen. How often in the history of fruit culture has it not been the case that wealth of bloom has preceded great poverty of fruit. Is it not obvious that when such is the case, the bloom may be, and doubtless is, very largely infertile. Possibly a severe thinning of the fruit-buds ere the bloom advanced, would have done some good. Perhaps it would have been useless. I do not know that anyone experimented in that direction. It is really

important, however, we should understand exactly how much or how little harm the spring frosts did to the bloom. *A. D.*

A NEW CARNATION SOCIETY.—A few enthusiastic florists at Southampton purpose forming a society in that town, to be termed the Southern Counties' Carnation Society. Carnation florists usually have tastes for other plants also, and there seems to be no reason why the new body should not include itself the Southern Counties Florists' Association, and then include within the scope of such body, Auriculas, Polyanthus, Tulips, Pansies, Roses, Carnations, Dahlias, and even Chrysanthemums. Such inclusion would enable so many amateur florists of

THE KITTATINY BLACKBERRY.—This really very nice and truly marvellous cropping American Blackberry, shown at the recent Drill Hall meeting by Mr. Wadds, of Cliveden Gardens, seems to do much better on the banks of the Thames than it does generally. The Parsley-leaved *Rubus laciniatus*, it is well known, will succeed well on moderately dry soils, if they be but deeply worked, and where properly pruned and fed, produces splendid crops of fine fruit. But the Kittatiny is somewhat earlier in fruiting than is the other variety, and if it can be, as at Cliveden, accommodated with a deep, retentive soil, that is, even in winter, partially under water, it will do well. The canes or rods shown at the Drill Hall were about 5 feet long, and very heavily laden

a thousand parts of water—that is to say, 1 oz. of the sublimate to 62½ lb. of water. Immerse the tubers in the solution for two hours, shortly previous to planting; take out and allow them to dry, when they may be cut if required. It is advisable to choose sets that are not themselves affected with the scab. *J. J. Willis, Harpenden.* [Care must be taken with this highly poisonous substance. *Ed.*]

ASTERS INJURED BY WORMS.—I grow a good many, and have frequently had them attacked by some kind of small worm. A strongish watering of dissolved nitrate of soda has generally settled the matter, and greatly benefited the bloom. *J. Z. L.*

THE LONGEVITY OF SEEDS.—In reference to a paragraph in your last issue, I am inclined to think no time will destroy some seeds under certain conditions. In 1894 I double dug 20 inches deep some turf for planting. The turf is a portion of the park here, and was enclosed from Needwood forest in 1337. As far as I know it has never been disturbed, but as soon as it was dug a quantity of Gorse sprang up in all directions. There is no Gorse near it. I give the fact for what it is worth. *J. Z. Levitt, Wychnor Park, Burton-on-Trent.*

THE LONGEVITY OF SPORES.—Your short note in last week's issue upon Mr. Charles Naudin's contribution to the *Bulletin of the Société Nationale d'Acclimatation* on "The Longevity of Seeds and their Preservation in the Earth" is particularly interesting, as indicating the possibility of obtaining rare plants from seeds deposited by them *in situ*, the plants themselves, it may be, being difficult of removal, or, being removed, perishing in transit, or subsequently. A particular instance of this kind within my own knowledge occurred some years ago in the case of a finely-crested form of the Parsley Fern (*Allosorus crispus*) found at Leathwaite, which, in the hands of Mr. J. M. Barnes, thrived for some years, affording me an opportunity of seeing it; but then, as is frequently the case with this species under culture, it got out of condition, and perished. As it represented the only recorded variety in the species, and was a very good form in addition, the loss was much regretted; but it occurred to Mr. Barnes to make a fresh search at the spot where it was found, and which fortunately could be determined exactly. He did this, but failing to find another specimen, it occurred to him to bring away a quantity of the earth with him. This earth he distributed over prepared pans, with the result that he obtained a liberal crop of the characteristically-crested plants, the spores of which had evidently been lying dormant in the soil. Considering the great difficulty, often insurmountable, experienced by observant travellers in not merely securing new, or presumably new, plants which they meet with, but in maintaining them subsequently in a living state until they can be suitably installed for cultivation, a very valuable suggestion is embodied in such recorded facts as these. Rare Ferns and Orchids must, as a rule, spread a liberal annual crop around them of these spores and seeds, and thus afford ample opportunities for their introduction in a form which presents next to no difficulty of transport; all that is necessary being to follow Mr. Barnes' procedure, and spread the soil thinly over properly-prepared compost, and subject the same to the temperature proper to the habitat whence it was derived. Since, too, spores and many seeds are disseminated by the wind to considerable distances, travellers would do well to collect surface soil in likely places where rare plants are prevalent and collections rare; it would be odd indeed if the resulting crop would not yield a host of interesting things with a fair percentage of new ones. With regard to the *Helianthemum* seeds found in soil from the Sahara deserts, their presence there does not necessarily imply longevity, since assuming the flower to be indigenous, they might be annually distributed from far distant oases by the wind-storms peculiar to that region. Sunflower seeds are sometimes used as food, and they might, if found on the recognised caravan tracks, be simply dropped *en route*. In any case, to spread such imported earth over flower-beds introduces a great element of uncertainty in the ultimate results. *Chas. T. Drury, F.L.S.*

BRICK-COVERED VINE-BORDERS.—Your correspondent, Mr. Markham, is evidently not favourably impressed with a brick covering on Vine-borders. I have found it to answer admirably here—indeed, far beyond my most sanguine expectations; in proof of which, I invite Mr. Markham, or anyone else interested in Grape-growing, to pay me a visit. The visit must be within the next ten days or a fortnight, as we are now cutting from the house to which I

MR. J. A. S. McINDOE.

Winner of the First Prize in the Victorian Fruit Class at the Shropshire Horticultural Society's Show.

(See p. 134.)

erze tastes to associate themselves with the movement. It may be urged that exhibitions of these flowers could not be held simultaneously; but shows, after all, are very small matters compared with the encouragement a combined association might give to the culture and improvement of all the winter flowers named. No doubt the Southampton Horticultural Society would feel aggrieved over the nomination of such a society, especially that its own is just now in a very precarious position, but it does next to nothing for the encouragement of the flowers mentioned, beyond holding a show of Chrysanthemums in the autumn. However, the chief value of the announcement comes from the evidence furnished of the interest which Carnations and Picotees have aroused in the southern districts. Clearly the National Society must look to the laurels if the Southern Counties Society be named. *A. D.*

with fruit, which proved to be exceedingly pleasant eating—much superior, indeed, to fruit of Wilson, Junior, sent for comparison. *A. D.* [We have also received specimen of fruits and a letter from Messrs. Wm. Fell & Co., Hexham. *Ed.*]

CURE FOR POTATO-SCAB.—From many experiments which have been made during the present season at different experimental stations in the United States, on the question of the prevention of Potato-scab, which so seriously interferes with the saleable condition of the tubers, it appears that a real preventive has now been discovered, provided the land upon which the Potatoes are set has not previously been contaminated with the disease; and even when that is the case, the disease has been considerably lessened. The following is the formula to be followed:—Make a solution of corrosive sublimate (which can be obtained at the chemists), one part to

wish to draw attention. The brick-covering is not intended as a fertilising agent; it is merely placed on the border to prevent it being trodden upon, to maintain on the surface an equable moisture, and to encourage the roots to come to the surface. This is the result of the brick-covering here; but the bricks here do not show green moss, such as described by Mr. Markham. This, together with the sodden state of the border underneath, betrays, I am afraid, a too free use of water at times when it was not wanted. Briefly, my practice is something like this:—After washing the house, pruning the Vines, and dressing them with some insecticide, we then remove the bricks out of our way; take away any loose exhausted earth we find on the surface; examine whether the roots are on the surface and whether the border is wet or dry; if the latter, we open the border gently with a fork, taking care not to break any of the roots which we invariably find scattered all over the surface. This done we throw on a liberal sprinkling of Thompson's Vine Manure, washing it in with a free and liberal application of water. This operation is followed by a top-dressing of healthy yellow loam, also freely mixed with more of Thompson's. The bricks are then placed on, and the house may now be pronounced ready for another year's Grape campaign. After all this treatment it will be seen that care must be taken not to pour water indiscriminately on to those bricks, or the soddening of the border mentioned by Mr. Markham will be the result, first satisfy yourself that the roots are well at work and in a fit state to receive and assimilate moisture. I cannot cut and send a whole house of Grapes up to the Drill Hall, but if the Royal Horticultural Society should think it worth their while to send some one here to see those Grapes and report thereon, I shall be very pleased to see them. The above Vines have been planted thirty-five years. *W. Miller.*

THE WINE-BERRY.—I herewith send you a few specimens of fruit of *Rubus phenicolasius*, the Japanese Wine-berry, introduced a few years ago, and acknowledged to be one of the most valuable of its kind. It is very vigorous in growth, attaining a height of 5 or 6 feet, and perfectly hardy. Its leaves are a dark green outside and silvery underneath. The young shoots are covered with a reddish-brown hair or moss, which makes it look, perhaps, odd, but handsome. The fruit is borne in large clusters, often 60 and 100 berries on one bunch, and the flavour of the fruit is different from any other berry, being sprightly, sweet, and juicy, with a delicate luscious flavour, peculiar to itself, and superior to others of the same family. For cooking purposes, nothing can be compared to it, as it still retains its fresh flavour. The fruit commences to ripen early in July, and continues for a very long time, and it also makes delicious jelly. The specimens sent are from the well-kept gardens of Lady Howard de Walden, De Walden Lodge, Eastbourne, and are grown on the chalk for the last three years, thanks to Mr. Simmonds, the gardener, who prides himself in all her ladyship's botanical pets, which are very numerous. *J. D.* [The plant was figured in the *Gardeners' Chronicle*, 1886, vol. xxvii., p. 365, and has frequently been exhibited at the Royal Horticultural Society. Ed.]

ROSA WICHURIANA.—This seems quite at home rambling on the face of rockwork at De Walden Lodge, Eastbourne. It resembles the Macartney forms, with small glossy foliage and long trailing growths, flowers pure white, and yellow stamens—a lovely hardy and beautiful Rose for rockwork, &c. *J. D.*

THE HORSE-CHESTNUT AND ITS ALLIES.

ÆSCULUS (INCLUDING PAVIA).—Among the larger trees of cool temperate regions there are few of the size of the Horse-Chestnuts that equal them in their combined beauty of flower and leaf. In our own country, certainly, there is none among what may be termed flowering trees possessing the stature and bulk of the common Horse-Chestnut, along with such a stately beauty when fully in bloom. Of the eight or nine species in cultivation it is by far the largest; the others (under the conditions that obtain in this climate) never get beyond the dimensions of small trees or shrubs. The two sections of the genus—*Æsculus* and *Pavia*—were at one time kept up as separate genera on the strength of the five-petalled corolla and spiny, thick-valved fruit of the *Æsculus*; and the four petals and smooth fruit with thin

valves of the *Pavia*. But in both the American *Æ. glabra*, and the Asiatic *Æ. turbinata*, these distinctions break down, each species possessing some of the characters that pertain to both sections.

The following list includes all the species in cultivation:—

EUROPEAN.

Æ. Hippocastanum.

ASIATIC.

Æ. chinensis (identity doubtful).

Æ. indica.

Æ. turbinata.

NORTH AMERICAN.

Æ. californica (Pavia).

Æ. flava (Pavia).

Æ. glabra.

Æ. parviflora (Pavia *macrostachya*).

Æ. Pavia (syn. *Pavia rubra*).

OF HYBRID ORIGIN.

Æ. carnea (*Æ. rubicunda*).

Many garden forms.

Æ. carnea is almost certainly of hybrid origin, but its history is unknown. There is also quite a crowd of forms, hybrid or selected, belonging to the very variable *Æ. flava* and *Æ. Pavia*, many of them being intercrosses between those species. In this class are to be included the trees (none of them real species) known in gardens and nurseries under one or other of the following names: bicolor, hybrida, lucida, lutea, Lyoni, macrocarpa, neglecta, pallida, Whitleyi, &c. Some of them are amongst the most ornamental and richly-coloured of the smaller sorts—superior, indeed, to the species from which they have been derived; but the differences between a goodly proportion of them are so slight, and there are so many whose characters have never been properly defined, that it would be a long and difficult task to unravel them at this date. In the following notes the leading types only are considered.

All the *Æsculus* like a rich, moist, loamy soil. With the exception of *Æ. californica* and *Æ. indica*, which should always be given the most sheltered positions available, they are quite hardy. Propagation by means of seeds is, of course, the most desirable as a means to vigour and long life. The seeds of the Horse-Chestnut should be sown as soon as they fall; when put away under the conditions suited to the majority of stored seeds, they rapidly lose their vitality. Budding and grafting, but chiefly the former, have to be resorted to in the case of named varieties and hybrids. *Æ. carnea* (*rubicunda*) thrives perfectly on the Horse Chestnut, as do also the latter's own varieties, but it is not a suitable stock for the less robust and smaller-growing species and varieties of the *Pavia* section. They should be worked on stocks of their own group. It may be mentioned that the buds to select are not the ones on the leafy portion of the young shoot, where, of course, the thick, swollen base of the petiole is in the way, but the small crowded buds at the base of the shoot, and nearest the old wood, which in ordinary circumstances are dormant.

Æ. CALIFORNICA.

A rare species in cultivation here, and only likely to be hardy in the southern counties, where however it thrives well and flowers. Like several of the *Æsculus*, it varies greatly in stature and bulk in a wild state. Sargent (who figures it in his *Sylva*, tt. 71, 72) says it is oftenest a shrub 10 feet to 15 feet high, with spreading branches; but sometimes a widely-branched tree, 30 feet to 40 feet high. The leaflets are usually five in number on each leaf, but vary from four to seven; they are borne on short stalks, the smaller ones almost sessile, faintly toothed, and there is a slight pubescence beneath when they are young. The raceme is erect, and although not so large as some, is one of the most ornamental in the genus. It is 6 inches or more long, with the white or pale rose flowers closely set, and numerous. The fruit is slightly pear-shaped, and 2 to 3 inches

long, carrying as a rule one seed. In California it flowers in May, but not till a month later in this country. It was first introduced by Messrs Veitch, and they were also the first to flower at Exeter in July, 1858. It is a native of the Upper Sacramento river, California, and on the western slope of the Sierra Nevada Mountains. For tree-lovers favoured districts it is a tree worthy of notice; only because of the beauty of its flowers, but also for the length of time over which the flower season extends.

Æ. CARNEA (THE SCARLET HORSE-CHESTNUT).

Of the Horse-Chestnuts with coloured flowers, it is certainly the most ornamental. It is far from being as large a tree as *Æ. Hippocastanum*, and rarely exceeds 30 feet in height. Of its origin nothing definite is known, but it is believed to be a hybrid possibly between the common Horse-Chestnut and *Æ. Pavia*. It is at once distinguishable from the former of these by its leaves; they are of a deep green, the leaflets have a more uneven surface, and are also more or less curved and twisted. The flowers are borne in racemes 8 to 10 inches long, the flowers being a rich rosy-scarlet. On first opening each petal is marked by an orange-yellow blotch at the base, which afterwards becomes a deep red. The red colouring matter, to which the flowers owe their beauty, also permeates other parts of the plant; the leaf-stalks are often of a rich rhubarb-red, as are also the mid-rib of the leaflets and the main and secondary flower stalks. There are several forms of this Horse Chestnut in cultivation, whose differences consist chiefly in a varying depth of colour. The finest of them all is var. *Briotii*, its flowers appearing in large racemes, and being of a richer red than any other.

Æ. FLAVA (SWEET BUCKEYE).

A tree about 30 feet high, as a rule, but, according to Sargent, met with in America sometimes as a shrub, or, on the other hand, as much as 90 feet height. Each leaf has from five to seven leaflets that taper towards both ends, but more abruptly towards the apex; they are pubescent beneath, especially on the midrib and veins, the pubescence being mostly whitish, but occasionally of a reddish-brown. The racemes are 4 or 5 inches high, and (in many cases) may be considered as the typical form; the flowers are pale yellow. But this is a most variable tree, and has apparently hybridised with other *Amelanchier* species. There is, in consequence, a large number of varieties in cultivation, many of which have been named. The sorts grown as *neglecta*, *hybrida*, *Lyoni*, *macrocarpa*, *pallida*, *discolor*, and others belong to this species, or are hybrids in which it predominates; but variations equal in importance to those that some of them show may sometimes be discovered in a batch of seedlings raised from a single tree. It is a native of the Eastern United States, is a superior tree to *Æ. glabra*, from which it is distinguished by its short stamens, which are hidden by the petals. *H. J. Bean.*

(To be continued.)

SCOTLAND.

A BATCH OF NEW STRAWBERRIES.

In these days some of our skilled horticultural experts seem to make new Strawberries as easily as they make new sovereigns at the mint, and it is they are produced for the same reason, namely, to make new sovereigns and Strawberries alike wear out. A sovereign in course of transference to many hands becomes a mere shadow of its former self; its destiny is the smelting-pot. Among Strawberries when vital force becomes weak, a cross, or new sort of fresh blood gives us a New Leader, a New Sovereign, a Monarch, a Prince, a Princess, a Lady, Veitch's Perfection, or What Not, and with new life and energy.

We are very far from saying that all the Strawberries are better than the old ones, the Strawberries that have held the field on either the Tweed—Garibaldi [This is Vicomtesse de

bury. Ed.] on the North and Paxton on the b, will need a very great deal of beating, and no seems to wish that either should be driven off field, so useful has each been in the past, is now, is likely to continue to be for many years to

as writer will not readily forget the look that ed over the face of a field-grower of Strawberries ie North a few days since, who complained so ly of the conduct of Garibaldi this year that the er, half in fun, half in earnest, advised him to them up and plant at once with Royal Sovereign. na, mon; na gif ye planted the Sovereigns for

Denmark, and Richard Gilbert are also fine prolific varieties, filling a large portion of the Strawberry season—the Princess of Wales promising to be a good second to Royal Sovereign, Garibaldi, or Earliest of All; and Richard Gilbert, in firmness of texture and quality, the coming substitute for the most useful Paxton. Veitch's Perfection, a cross between Waterloo and British Queen, has also gained a rapid reputation for quality and fruitfulness. The seedlings raised by Mr. Allan, of Gunton Park, Norwich, are also growing into favour with market men, and extending into private gardens. The opinion of several Strawberry experts has recently been given to the effect that

to combine the best qualities of both parents. I should rather define the flavour as a choice blend of British Queen, Frogmore Late Pine, with a dash of the old Hautbois.

Two promising Strawberries have been shown at the last meeting of the Scottish Horticultural Association in Edinburgh. One a fine large fruit, W. E. Gladstone, of which the stock is held by James Grieve & Sons of the Redbraes Nursery, Edinburgh; the other, Thomas Carlyle, a cross between Garibaldi and Dr. Hogg, in which the first parent has shown its prepotency in habit, earliness, and fertility, and a rich smack of Dr. Hogg is distinctly realized.

In case so many novelties should confuse some steady-going readers and growers, I would recommend Garibaldi, Royal Sovereign, La Grosse Sucrée for the main early crop; British Queen where it does well, Dr. Hogg, Gunton Park, Richard Gilbert, Sir J. Paxton, and President for main crop; and Lord Suffield, Prince of Wales, Waterloo, and Latest-of All for the latest. By growing some of the latter on borders on the north side of walls, another month may be added to the length of the Strawberry season. When in Perth the other day I was not surprised to find growers still swearing by the Elton Pine as their best and latest Strawberry. D. T. F.

TREES AND SHRUBS.

ITEA VIRGINICA.

WHEN properly treated, this North American shrub is very ornamental, yet it appears in late years to have fallen into neglect. It is the more valuable because it flowers during July and August, when hardy shrubs in bloom become scarce. It grows naturally in wet situations in several of the Eastern United States, and an abundance of moisture, together with a rich loamy soil and a sunny position, are its chief requirements under cultivation. It grows into a rounded bush 3 or 4 feet high (perhaps more ultimately), and has lanceolate, dark green leaves about 3 inches long, pointed and minutely toothed. The flowers are very numerous, and closely set on an erect, simple, and cylindrical raceme, which measures about 4 inches in length. The flowers are rather dull white, scarcely half-an-inch across, with five linear pointed petals. When the plant is seen at its best, these racemes are borne abundantly, and it is then as ornamental as *Clethra alnifolia*, which it resembles. But that shrub, of course, belongs to the Heath family, whilst the *Itea* is one of the shrubby Saxifragaceæ. It is an old garden plant, and is said to have been cultivated by Archibald, Duke of Argyll, in 1744. W. J. B.

SWEDEN.

STOCKHOLM.—The second horticultural show in connection with the General Art and Industrial Exhibition in Stockholm, was held on July 30 to August 2. The show was well attended. Large decorative plants and fruits and vegetables were well represented. There were also good collections of hardy annual and perennial flowers, and decorative arrangements of flowers.

The Swedish Horticultural Society of Stockholm had invited horticulturists from the whole of the country to a conference. On Saturday, July 31, delegates from the different societies met, and on Sunday, August 1, the general meeting, which was attended by about 400 persons, took place in the House of Parliament (Riksdagshuset).

There were in all seven questions on the programme. The first and the chief one related to the formation of a fund for the purpose of relief to gardeners, nurserymen, and their families, when in need. The debate was opened by Herr Knut Bovin, who spoke about the necessity of a better organisation of gardeners and nurserymen in the interest of the whole trade, as well as of the individual members, and pointed out how in other countries great results

WILLIAM MILLER.

(Gardener at Combe Abbey for the past thirty-six years, and Senior Judge at the Shropshire Horticultural Society's Show.)

ing. Garibaldi is an old tried friend, that has ly done well by me, and I maun just stick til't, ve up Strawberry growing."

ch strong conservative feelings, though not often rongly expressed, largely prevail among fruit-ers. It proves also a useful antidote to the too substitution of new varieties for old. The er should always be tried tentatively, as few s are more influenced than Strawberries by soil climate. From the Laxton mint at Bedford, Sovereign and Latest-of-All may safely lanted in quantity. Early Laxton and ch are also promising sorts. Mr. Carmi- s four, Prince and Princess of Wales, Queen of

Lord Suffield and Gunton Park Strawberries not only match but excel in flavour British Queen and Dr. Hogg. Such testimony might have caused raisers to pause in their work. It seems, however, to have only roused Mr. Allan to new efforts among his favourite fruits. Hence, at the show at Norwich he showed Lady Suffield, a cross between Lord Suffield and Empress of India.

I have also had the pleasure of tasting and carefully comparing and contrasting Lady Suffield with other fine standard varieties, old and new. I have no hesitation in stating that for unique flavour and delicious aroma this promising Strawberry probably excels all which have preceded it. It has been said

were achieved in this direction. He read out some extracts from the rules of the English Gardeners' Orphan Fund and the Gardeners' Royal Benevolent Institution, and recommended that a similar organisation should be established in Sweden. The matter was referred to the Swedish Horticultural Society in Stockholm, which has to appoint a committee to work out a plan of organisation to be laid before the societies in the different parts of the country.

The second question—the formation of a National Horticultural Society—was considered nearly allied with the first one, and was referred to the same body to be dealt with.

The next conference is to be held, in connection with a horticultural exhibition at Malmo, in the year 1900.

From September 23 to 30 this year an autumn and fruit-show is to be held here in Stockholm. *M-g.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

AUGUST 10.—*Present:* Dr. M. T. Masters (in the chair); Rev. W. Wilks, Dr. Bonavia, and Rev. G. Henslow, Hon. S. C.

Vine-leaves Defective.—Some Vine-leaves, which appeared to have decayed prematurely were exhibited. No fungus was present, and their defective appearance was attributable to too high cultivation, guano being freely used, with great heat, and too much water, such being quite consistent with their appearance.

Ribes aureum in Fruit.—Dr. Masters exhibited a branch, bearing a raceme of ripe purple-black berries, of this common shrub. Though introduced by Mr. Douglas from California, the fruit has rarely if ever been seen before. It was received from Mr. Veitch.

Chrysanthemum-leaves Attacked by Grubs.—These were received from Mr. Jenkins, and were forwarded to Mr. McLachlan, who reports "that the grubs are very young larvae of the 'Silver Y-moth' (*Plusia gamma*). It will attack almost anything. They should be destroyed by hand-picking." The caterpillars are doing considerable damage to the Chrysanthemums.

Green-flowered Cross-leaved Heath.—Dr. Masters showed specimens of this unusual condition. It resembles the "Wheat-eared" Carnations sent to the last meeting, and consists of an abnormal repetition of ciliated bracts; the flower in the centre having been arrested in consequence of an attack by some grub.

Pelargoniums Decaying.—Examples of the varieties *Vesuvius* and *West Brighton* were shown, which had decayed from the collar upwards. It was attributed to too deep planting. They had large roots, and had been apparently quite healthy when planted, some being over two-year-old plants. Possibly they were attacked by a slime-fungus.

HASTINGS AND ST. LEONARD'S HORTICULTURAL.

AUGUST 11.—There are few prettier places on the south coast for an exhibition of flowers than the Alexandra Park, Hastings, and the above show was one of the best held by the Society. The exhibits were good throughout, but especially so the plants, groups, fruit, and table decorations.

Mr. T. Portnell, gr. to Sir A. Lamb, Bart., Battle, was very successful with plants, winning 1st prizes in all classes open to him. Mr. A. Gadd, gr. to P. A. Eagles, Esq., followed in the majority of cases. Particularly noticeable were *Ixora javanica* and *I. Fraseri*, *Statice Gilberti*, *Rondeletia speciosa major*, *Phormium variegatum Veitchi*, *Phoenix dactylifera*, and *Areca Baueri*, among Mr. Portnell's many plants. Mr. F. Morris, gr. to C. J. Eden, Esq., Hastings, was also very successful here. Mr. Portnell again led for stove and greenhouse flowers.

Mr. J. Stredwick, Silverhill, Hastings, won for twelve Cacti, for twelve bunches of Pompones, and for twelve show or fancy Dahlias, his examples of *Matchless*, *Cyril*, and *Delfini* being very good.

Mr. T. Durrant Young, Eastbourne, was 1st for twenty-four cut Roses, closely followed by R. E. West, Esq., Reigate. Table decorations were especially good, Mr. Notcutt, St. Leonard's, winning for three stands (open), and Miss Smith, St. Leonard's, for three stands (ladies only).

Fruit, especially Melons and Grapes, were good. Eight competed in a class for three bunches of Black Hamburgh Grapes, Mr. Camm, gr. to the Duchess of Cleveland, Battle, just beating Mr. J. Gore, Polegate, who was 1st for three of any other black with *Gros Maroc*, and for three of Buckland Sweetwater. A collection of eight dishes found Mr. Gore well ahead.

Vegetables were much in advance of expectation for so dry a season, and upon the warm, shallow soils of the neighbourhood. *A. P.*

BISHOP'S STORTFORD FLOWER SHOW.

AUGUST 11.—The annual show of the Bishop's Stortford Horticultural Society took place on the above date, at the Grange, Bishop's Stortford, by permission of Mr. J. Barker, J.P. The exhibits numbered over 1200, and were fully up to the usual high average quality.

Among the nurserymen who exhibited were Messrs. T. Rivers & Son, of Sawbridgeworth, who had a choice collection of pot fruit; Messrs. Wm. Paul & Son, of Waltham Cross, and Messrs. G. Paul & Son, of the Old Nurseries, Cheshunt, both of whom showed collections of hardy herbaceous plants and cut Roses; Messrs. R. Wallace & Co., of Colchester, who had an attractive display of bulbous plants; Mr. W. Rumsey, of Waltham Cross, a fine lot of cut Roses; and Messrs. A. E. McMuller & Co., of Hertford, a stand of Sweet Peas.

In the competitive classes, there were some choice exhibits. For a group of plants, Mr. J. Richardson, gr. to Sir James Blyth, Bart., of Blythwood, Stansted, took 1st prize; Mr. T. Lodge, gr. to Mrs. Menet, Hockerill, 2nd.

In the classes for Begonias, which are always a strong feature of this show, Mr. D. Patmore, gr. to Mr. Charles Gold, jun., was 1st.

In the Fruit classes, the white Muscat Grapes which took 1st prize were an exceptionally fine exhibit, as were also the collections of fruit for which prizes were taken by Mr. B. Calvert, gr. to Col. Houlton; Mr. E. Atkins, gr. to Miss Pulteney; and Mr. Beech, gr. to Mr. Jno. Barker. The Grapes referred to were grown by E. Shelton, gr. to Mr. J. Barker, J.P.

The cottagers' classes were also well filled, and the quality of the produce was, considering the season, highly satisfactory. There were upwards of thirty table decorations in the ladies department, and also a number of very attractive decorations of other kinds. A show of agricultural produce was also held.

CARDIFF HORTICULTURAL.

AUGUST 11, 12.—The ninth annual show was held in the Sophia Gardens, Cardiff. The tents were pleasantly interspersed on the lawns amongst the shady trees and shrubberies, which gave an air of agreeable informality to the exhibition.

The groups of plants and the table decorations were decidedly the best features of the show, and proved extremely attractive; while fruit and vegetables, on the contrary, were fewer in quantity, and of moderate quality.

Among cut flowers, Roses were splendid for the season, as were also Dahlias, but the competition was not extensive. Bouquets, wreaths, crosses and sprays, were remarkably fine.

In the open class, a prize of £10, and a Silver Cup valued at 2 guineas, for the best group of miscellaneous plants, arranged for effect, on a space of 100 square feet, was won by Mr. McLew, gr. to John Gunn, Llandaff, with an admirably-arranged group of graceful plants, which for beauty of effect was charming. Conspicuous in the formation of this group were some lovely specimens of Bamboos; Messrs. Case Bros., Cardiff, and Mr. R. Crossling, Penarth, took 2nd and 3rd prizes respectively, both being good; but in attempting to break away from the conventional circle style, by making use of cork bridges, slightly overdid it, the idea hardly being suitable to the limited space of 100 feet square.

In the amateur class, Mr. McLew was again successful with a charming group occupying 50 square feet; Mr. W. Carpenter, gr. to W. J. Buckley, Esq., Llandely, was 2nd.

For the group occupying 25 square feet, Mr. Rex, gr. to -- Waldron, Esq., Llandaff, was 1st.

For the best six stove or greenhouse plants in bloom, Mr. Lockyer, gr. to J. C. Hambury, Esq., Pontypool Park, won 1st prize, with well-flowered plants of good species. Mr. Lockyer also took the 1st prize for the best single specimen plant in bloom.

In the open class for six Fuchsias, Mr. Hillard, an amateur, won the 1st prize; and also secured a Certificate of Merit for the best-grown Fuchsia in the show.

Mr. L. Clarke, gr. to Col. Sir Edward Hill, Llandaff, took 1st prize for twelve plants for table decoration.

Mr. McLew carried off the 1st prize for the best six stove or greenhouse Ferns, with splendid specimens of *Davallia Mooreana*, *Adiantum plumosum*, *Microlepia hirta cristata*, *Cibotium Barometz*, *Asplenium nidus*, and *Gymnogramma schizophylla*.

A very handsome and well-grown collection of Cacti in pots was exhibited by Mr. Ralph Crossling, Penarth, which was deservedly awarded a Certificate of Merit by the committee. Amongst them, *Reine Charlotte*, *Italia*, and *Austria* were noticeable, while John Crossling, a seedling raised at Penarth, attracted attention.

In the cut-flower section, Mr. Ralph Crossling and Mr. Stephen Treseder, Cardiff, took all the chief prizes for Roses, the former also winning the Royal Horticultural Society's Silver Medal with his stand of H.P., twelve varieties, of three blooms each. The varieties in this stand were *Victor Verdier*, *Ulrich Brunner*, *Victor Hugo*, *Jean Souper*, *Mrs. John Laing*, *Foster Holmes*, *Horace Vernet*, *A. K. Williams*, *Heinrich Schultheis*, *Alfred Colomb*, *Duchess of Bedford*, and *Duke of Wellington*.

For twelve bunches of Cactus Dahlias, Messrs. Keynes, Williams & Co., Salisbury, were 1st; and Mr. William Treseder, Cardiff, a good 2nd; while John Basham, Basaleg, was awarded a special prize, and deservedly so, for

his collection. Messrs. Keynes, Williams & Co. had three new seedlings, *Acachon*, *Mary Service*, and *Br* which unquestionably gave their collection the prior

For twenty-four Dahlia blooms, Messrs. Keynes, W & Co., and Mr. W. Treseder, were 1st and 2nd respectively. In the open class for table decorations, Messrs. Case Cardiff, were 1st, and obtained the Royal Horticultural Society's Silver Medal for a very effective arrangement. Phelps, Cardiff, was 2nd.

Mr. A. E. Price, Cardiff, was 1st for the band with a beautiful arrangement of *Odontoglossum*, *Cal Paneratum*, and *Asparagus plumosus*.

FRUIT.—Mr. J. M. Franklin showed some fair Grapes, and — Phillips, Esq., of Hereford, some Peaches. Pine-apples were inferior. Melons were Mr. Basham, of Basaleg, showed some fine culinary.

VEGETABLES were shown well by Mr. Charles Foster Morgan S. Williams, Esq., Neath, who carried off principal prizes.

TRADE EXHIBITS.—Mr. William Treseder, Cardiff, very nice herbaceous flowers, and some fine Dahlia for which this firm has more than a local reputation. Birkenhead, of Sale, showed, as usual, a very fine collection of Ferns; and Messrs. Clibran, Altrincham, amongst exhibits, had some good *Viola* blooms.

MARLOW HORTICULTURAL.

AUGUST 11, 12.—This Society held its annual exhibit the above dates in the Cricket Ground. This is the exhibition of the Society, which continues to grow in importance, and the exhibits on this occasion were of good quality.

Messrs. J. Veitch & Sons, contributed 150 bun hardy herbaceous flowers and annuals, while Mr. C. T. Royal Nursery, Slough, also sent a not less merited collection of Roses, Carnations, Dahlias, and herb flowers.

Messrs. J. Laing & Sons sent a handsome group of native plants, and Mr. R. Owen, and Mr. Such, Malden, plants, cut flowers, and floral designs.

Groups arranged for effect in a semicircle were a feature, Mr. Blackmore, gr. to R. Hay Murray, Spinfield, Marlow, obtaining an easy 1st, with an arrangement composed almost entirely of highly coloured plants.

Fruits were shown in numerous classes, and were average quality. The competition in the classes for tions of vegetables was keen.

TAUNTON DEANE HORTICULTURAL.

AUGUST 12.—This was the thirtieth annual show society having been established in 1866; and there falling off whatever perceptible in the interest the awakens in the district. The Vivary Park, which has greatly improved since it became the property of the town, charmingly fresh and green, and the grouping of the tints admirable. The secretary, Mr. John S. Windsor, admirable manager, and the judges were able to perform duties with ease. Some falling off in the number of plants staged was apparent, but the series of w England shows make a great demand upon exhibit this season of the year. Cut flowers were numerous their quality generally very good; vegetables very fine table-decorations greater in quantity than is usual.

Specimen stove and greenhouse plants are always a feature of great interest at Taunton, £20 being offered as a prize for twelve; and Mr. J. Cypher of Cheltenham was usual with some very fine specimens, which took 1st prize in this class, and the one for six plants; Rowland, gr. to W. Brock, Esq., was 2nd.

In Division B, Mr. Rowland was 1st with twelve stove greenhouse plants.

The best six plants came from Mr. Thomas, gr. to Marshall, Esq., Taunton.

Groups of plants arranged for effect were shown in classes, and in both of them Mr. Rowland, who has an eye for a light and effective arrangement, took the 1st. Mr. Peel being 2nd. The latter had the best six stove plants, chief among them being two good specimens of *Marnockiana* and *Turnbulli*.

Orchids were shown in four in two classes. Mr. Th gr. to W. G. Marshall, Esq., Taunton, was 1st in both. Tuberos-rooted Begonias were well shown by Mr. T in two classes, and by the Rev. J. D. Price in an *Cockscomb*, *Gloxinas*, *Achimenes*, *Fuchsias*, *Ba Petunias*, and *Lilies* are still invited, but they vary in one year after another; so long as they are retained schedule so long will they be grown and exhibited specimen Fuchsias fall behind those seen at Trow and elsewhere. The best newly-introduced flowering was *Dipladenia boliviensis amabilis*, from Mr. Rowland best foliage plant, *Croton Flamingo*, a brilliant form Mr. J. Cypher.

The best specimen stove plant was a fine piece of *S notis floribunda*, from Mr. S. Bennett; and great plant, a capital example of *Dasylirocn acrotrichum*, fr W. A. Sandford.

Cut flowers are very popular at Taunton, and they

leading feature. The best thirty-six, and also the best twenty-four, came from Mr. J. MATROCK, Headington, Oxford; Messrs. J. TOWNSEND & SON, Worcester, were 2nd in both classes.

In the amateurs' division, Mr. THOMAS HOSEA, Lower Easton, Bristol, was 1st with twenty-four and twelve Roses, and twelve Teas; taking the 1st prizes in each with excellent blooms for the time of year.

For Dahlias, Mr. GEORGE HUMPHRIES was 1st, with twelve show, and also with twelve fancy varieties. Cactus and decorative varieties, single and pompons, Mr. G. HUMPHRIES staging pretty blooms of the latter. Phloxes were shown in collections of twelve spikes. Quilted and flat-petalled Astors, owing to the dry season, were below mark; the comet varieties came to the fore in the latter class. Gladioli were shown in twenty-fours and twelves; and Phlox Drummondii, which has quite displaced the Verbena, was shown in fine, fresh, attractive bunches.

Floral decorations included a table laid for eight persons with fruit and flowers, Mr. J. CYPHER taking the 1st prize, with a charming arrangement.

FRUIT was a good feature, though owing to the scarcity of some kinds, it was not shown so numerously as usual. The best eight dishes, which consisted of Black Hamburg and Muscat of Alexandria Grapes, Bellegarde Peaches, Pine Apples, Nectarines, Figs, Apples, Cherries and Melons, came from Mr. J. LLOYD, gr. to V. BRUCKEY, Esq., and Mr. CROSSMAN, gr. to J. BRUTON, Esq., Yeovil, was 2nd.

Mr. CROSSMAN had the best four dishes, setting up good Madrasdell Court Grapes, Dymond Peaches, Windsor Castle Nectarine and Melon; Mr. LLOYD took the second prize.

The classes for Grapes and Peaches were satisfactory. Pines were not so numerous as usual. The best dessert Pears were Williams' Bon Chrétien and Jargonelle, the former evidently from an Orchard House; the best dessert Apples, Red Astrachan, Irish Peach, and Beauty of Bath; the best culinary, Lord Suffield, Peasegood's Nonsuch, and Warner's King. Apricots, Red and White Currants, with Cherries, were also shown.

VEGETABLES.—There was a large display of vegetables. The special prizes offered by Messrs. BUTTON & SONS, E. WERN & SONS, and JARMAN & CO., brought fine collections; and those who were found declaiming against undue size, would find much to criticize among those vegetables, and especially the Potatoes, shown at Taunton; but the Potatoes were handsome, clean, and bright, and generally even in size. Judges have shown their preferences for size in Potatoes, and exhibitors follow their lead.

Numerous Exhibits included a magnificent collection of sixty-six spikes of Gladioli, from Messrs. KELWAY & SON, Langport. Mr. B. VERRON & SON, Nurserymen, Exeter, had a large and varied collection of plants and cut flowers, occupying a considerable space. Messrs. FOOT & SON, Nurserymen, Sherborne, had cut examples of Cannas, Dahlias, Violas, &c. Messrs. W. TURNER & SON, Florists, Taunton, cut Dahlias, Carnations, Sweet Peas, &c.; and Messrs. JARMAN & CO. a large exhibit of Dahlias, Sweet Peas, hardy flowers, Roses, &c.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

AUGUST 12.—Committee present: Wm. Thomson, Esq., Walton Grange, in the chair; and Messrs. G. S. Ball, W. A. Gent, Dr. Alexander Hodgkinson, A. Warburton, H. Greenwood, P. Weathers, R. Johnson, and Jas. Anderson.

There were no groups presented on this occasion, but there were fifty-seven different plants submitted from various owners. Amongst these were four that obtained First-class Certificates, and twelve Awards of Merit.

HENRY STEEL, Esq., Tipton Court, Sheffield (Ed. Howarth, fr.) presented *Odontoglossum crispum* var. *Henry Steel*. This plant bore a spike with a dozen flowers of large size and good substance, with pale lilac blotches, and having a lip of large size similarly adorned (Award of Merit).

Mr. JAMES ANDERSON, Wallace Avenue, submitted a very high-coloured *Cattleya Warneri* magnifica (Award of Merit); the segments were uncoloured of pretty rosy-crimson, the lip deeper in colour. The same exhibitor had a fine variety of one of Jensen's imported *Odontoglossum crispum*, the lip being large, and finely blotched and spotted, which the committee asked to see again. The spike had seven flowers on it. *Cattleya superba splendens*, and several varieties of *Cattleya Harrisoni*, were also shown.

WALTER CLARKE, Esq., Wrexham (Mr. Thomas Jones, gr.), had *Cypripedium Youngianum*, in which is blended the *pumila*, *latigatum* and *Veltheili*; also the beautiful *Cypripedium Harrisoni* = *Harrisoni* × *Santerianum* (A. M.); this is an exceedingly showy and effective cross; also *Cyp. Alice* = *C. Spicerianum* × *Stonoi*.

Messrs. CHARLESWORTH & CO., Bradford, had several very good things; the only plant getting an Award of Merit being *Cattleya Eldorado Wallisi*, with albino segments, and having a bright orange blotch at the base of the orifice of the lip; *Cypripedium* × *apiculatum* and *C. x Hypatia*. Other good exhibits were *Leilio-Cattleya elegans*, called *Stelzneriana*, *Odontoglossum Pescatorei*, and the fine hybrid *Leilio-Cattleya velutina*.

SAMUEL GRATRIX, Esq., Whalley Grange (Mr. D. McLeod, gr.) had a good fresh plant of *Cypripedium* × *Gratrixianum* = *Ensladenae* × *bellatulum*. The flower was not fully developed, but it is a distinct *bellatulum* cross, and it is better than most of that progeny in having an elongated peduncle (Award of Merit).

Captain SCHOFIELD (Mr. Schill, gr.), had a beautiful form of *Leilio-Cattleya elegans* (Award of Merit) with an extra brilliant lip, but the sepaline segments comparatively narrow.

H. H. BOLTON, Esq., Newchurch (Mr. Eastwood, gr.), put up a fine variety of *Leilio-Cattleya crispata* (Award of Merit), which, when shown grown, may get the premier award; the lip is large and of fine quality.

THOMAS STATTEN, Esq. (gr., Mr. K. Johnson), had the effective and finely-finished *Cattleya Brymeriana*, in which the blood of *superba* and *Eldorado* was finely commingled (Award of Merit); also, the old and seldom seen in flower *Cattleya Dowiana*, fine, flat, typical flower (Award of Merit); *Cypripedium Charles Canham*, large, but rather dark in colour; *Lelia elegans Bluntii*, not a large flower, but having a lip of surprising brilliancy (Award of Merit). His chief exhibit, for which he received a First-class Certificate in cut flowers was *Cattleya Gaskelliana alba*. This was a flower of fine size, but not an albino, having the limbs slightly flushed; indeed, the licence taken with the name of *alba* is too great. Orchidophiles wink at any amount in the lip-limb of shades of yellow, and permit a pass to *alba*, but to no other colour. That matter wants clearing up.

F. O. WHOLEY, Esq., Bury (Mr. Rogers, gr.), presented a very fine coloured but not fully developed *Cypripedium Lawrenceanum*. In first rate variety, this takes a prominent place, although an old species.

JOHN LEMMAN, Esq., West Bank (Mr. Edgo, gr.), had a specimen placed with several large flowers of *Stanhopaea tigrina* (Award of Merit). These flowers were fully as good as any we have seen. Among others submitted we may name a good dark *Leilio-Cattleya elegans*, *Cattleya Warscewiczii* and *Gaskelliana*.

Geo. SHORLAND BALL, Esq. (Mr. Alex. Hay, gr.), had a First-class Certificate for a grand variety of *Maadevallia Veitchiana grandiflora*. It was only a small plant having a few brilliant flowers on it, the gold and the crimson merging and contrasting well; it will fill well when larger. The same gentleman had also a fine form of *Cattleya Gaskelliana* in a smallish plant with the segments snow white without flaw, and the ground colour of the lip also white with the lemon blotch in the orifice of the lip, with faint stencillings of roseate-pink towards the extremity of the blade exactly as in *Cattleya labiata bella*, described by me in *Gardener's Chronicle* in 1896, and precisely similar to *Cattleya labiata* Messurel noticed by your London Orchid correspondent.

Dr. ALEXANDER HODGKINSON, The Grange, Wilmslow (Mr. Joseph Moore, gr.), had a First-class Certificate for *Lelia monophylla*, with more than two dozen flowers on it, which also received a Cultural Commendation. This was really the gem of the meeting. It is the only *Lelia* we have from Jamaica, and it has been grown comparatively cool. Crowds of connoisseurs were about it after the award. It is about intermediate in size between *Lelia clunabarina* and *Sophroneites grandiflora*, and the colour is even more brilliant, without a single shade of other colour. The lip juts out, depending from an oblong column shaft—interesting and most beautiful. A First-class Certificate was awarded to *Sobralia Hodgkinsoni* (Rolle). This is in the way of *S. Lucasiana*, of excellent form, and the whole of the segments having a pink glow. The lip is of good form, more sessile than most of its compeers, with the blade extremity of glowing cerise, with white median line, and stopping short at the centre, from which the lemon solid blotch springs, the column, which is white, being scarcely convex. The best other things were *Cattleya Rex* and *C. Eldorado splendens*. J. A.

NATIONAL CARNATION & PICOTEE. (Northern Division).

AUGUST 14.—This society held its annual exhibition in the Annexe of the Royal Botanic Gardens, Manchester. The quality of both Carnations and Picotees was good, and in some of the classes there was a brisk competition. Mr. T. LORD, Holebottom, Todmorden, taking the premier prize for the fifteenth year without a break.

For twelve Carnations, bizzaros and flakes, white grounds, all dissimilar, Mr. LORD was 1st. The following were the best blooms: George, Master Fred, Gordon Lewis, T. S. Hedley, Bruce Findlay, Magpie, Mr. Rowan, Houlgrave, Ed. Curzon, Mr. T. Lord, and Thiddeus. Mr. J. EDWARDS, Blackley, was 2nd.

For twelve Picotees, white grounds, all dissimilar, Mr. T. LORD was again 1st, and Mr. KENYON, Bury, was 2nd.

For six Carnations, bizzaros and flakes, white grounds, dissimilar, Mr. C. HEAD, Hebdon Bridge, was 1st, with George, Magpie, Edith Annie, Crista-galli, Master Fred, and Robert Houlgrave; Mr. C. F. THURSTON, Wolverhampton, was 2nd.

For twelve selfs only, not more than two flowers of one variety, Mr. T. LORD was again 1st, having the beautiful yellow *Germania*, B-a-uty, Mrs. Fred, Joe Willett, Topsy, &c. Mr. EDWARDS was 2nd; Emir and Fire King were best here.

For six selfs, not more than two flowers of one variety, Mr. C. F. THURSTON was 1st; King of Scarlets was grand, also Surprise. Mr. E. SHAW was 2nd.

Mr. C. HEAD took the prize for the best Picotee in the show; Mrs. H. Hambro was by far the best white, an exhibit very full and of good size.

For six fancy or yellow-ground Carnations and Picotees, Mr. SKEELE, Henley, was 1st; Monarch and Mr. Edwards were fine blooms; the 2nd and 3rd prizes went to Messrs. BROCKLEHURST, MOSTIN, and KENYON, Bury.

Mr. LORD had the best scarlet bizzaro in Admiral Curzon,

and also the best crimson bizzaro with Master Fred, also best pink and purple with Edith Anne, and the best scarlet flake with Sportman. Mr. JOE EDWARDS had the best rose flake with Mrs. Rowan. "Tender" from E. R. Brown was a fine flower. Mr. LORD was again largely to the fore on purple flakes with Gordon Lewis.

Picotees.—Mr. LORD was 1st with John Smith and Brunette in heavy-edged reds. In light-edged reds Mr. JOE EDWARDS with Thomas Wallace. In heavy edged purples and in the single bloom classes he held his own throughout. First class Certificates were awarded to Mr. LORD for a fine flaked bloom called Mr. T. Lord, and to Mr. BESWICK for a finely-formed Picotee still to name. J. A.

THE SHOW-HOUSE AT THE ROYAL BOTANIC GARDENS.

The span-roofed show-house was ablaze with varieties of *Campanula pyramidalis*. On the other side was a grand lot of *Lilium lancifolium* of the darkest red-spotted strain, with many hundreds of expanded flowers. These, with *Hydrangea paniculata*, made a glorious display. In addition, we may mention that showy hardy bulb rising above the surface of the pot, *Hamamthus magnificus*, which completely beggars for effect the older *H. pulchellus*; the lustre of the globular heads is quite coral-like, and the yellow anthers make a grand top ornament.

THE ROYAL SCOTTISH ARBORICULTURAL.

AUGUST 16.—A very interesting annual meeting of this Society was held on the above date, Monro Ferguson, Esq., M.P., the President, in the chair. The Secretary, Mr. Robert Galloway, read out a list of seventy-three new members, the best possible proof of the vigour and life of this useful Society.

The Chairman seemed in a hopeful tone, while regretting the little support received from the Government, which he assured the Society did not arise from lack of willingness to give money help on the part of the Government, but far more for want of public sympathy and support. Landlords, factors, foresters, timber merchants, and the public at large were all interested in the production of timber of the highest quality at the cheapest rate. Its slow growth under the most favourable conditions told seriously against its increased production. While the farmer reaped one or more crops a year from his land, the planter may have to wait several generations for his profit. Forestry was far more dependent on landlords for capital than was agriculture, yet it was the last that had been first in their favour. The proprietors of Scotland, who had done so much to stimulate scientific agriculture in practice, had done practically nothing for commercial forestry. They had mostly confined themselves to forming the most beautiful pleasure-grounds in the world. This, however, was rather landscape-gardening than forestry. Factors and foresters, too, for lack of proper schools of forestry, had too often to buy their knowledge at the expense of owners. There are also other difficulties and discouragements to prevent owners going in for large outlays on woods. He was therefore driven to the conclusion that any considerable extension of timber-growing must be undertaken and partly managed by the Government. Still, if he could under present conditions counsel them to plant more, it was to all their interest to plant well and sell better if possible. Forestry to succeed under private management must have its records and its working plans kept carefully as title deeds, and posted up like ledgers. We believe that with the establishment of State forests, there would be prompt improvement in the Timber management of private estates.

But the time had not yet come for State forests in Britain, and indeed there were differences of opinion among arboriculturalists on the subject. But they were unanimous as to the need of a school or schools of forestry and experimental areas, and he believed that much of the future success of forestry lay in these directions, and this Society seemed the only available instrument able and willing to promote these desirable objects. He called upon them not to relax their efforts until they had made suitable provision for the training of foresters, so that they might remove the waste and ignorance besetting an industry which ought to rank, in Scotland at least, in honour and usefulness abreast of agriculture.

Professor SOMERVILLE, in moving a hearty vote of thanks to the Chairman, condemned the Government for ignoring forestry, and doing nothing to foster it in the Highlands. Professor Somerville then gave an able summary of the prize and other essays, with the somewhat stringent criticisms of the judges, which ought to prove instructive to the writers.

On the motion of Mr. M. DUNN, Dalkeith, the judges were thanked for their report, which was remitted to a committee.

FORESTRY IN THE VICTORIAN ERA.

Mr. M. DUNN, Dalkeith, afterwards delivered an address on "Forestry in Scotland during the Sixty Years of the Queen's Reign." During the last sixty years, he said, substantial advance had been made, not only in the introduction of new species of trees and shrubs, and improved methods of management, but in the keen interest displayed by the public in the question of forestry education, with a view to the more profitable development of forests. Forestry had made greater progress in the last sixty years than agriculture or horticulture, much as they had accomplished. Forestry, as now understood, was not known at the beginning

of the Queen's reign, and was almost entirely the creation of the Victorian era. Pursuing the subject, Mr. Dunn noted the improvements in tools, implements, means of transport, &c., which had taken place during the Queen's reign, and while pointing to famous planters prior to the Queen's accession, devoted particular attention to the noted men (largely Scotsmen), such as Douglas, Drummond, McGregor, Fortune, J. C. Loudon, &c., who greatly advanced the cause of forestry in Britain by the introduction of trees and shrubs from foreign countries. Among other branches of the subject to which Mr. Dunn directed attention were forestry literature, and forestry education, and the great importance which these had assumed in later years.

The meeting, on the motion of the Chairman, cordially approved of the recommendation of the Council, that members of the Society should use their influence with Town and County Councils and other local authorities, as well as landed proprietors generally, to induce them to plant specimens of ornamental trees, avenues, groups, and woods of all sizes during the ensuing season, to commemorate in an appropriate manner the Queen's Diamond Jubilee Year. In submitting the motion, the Chairman said that the planting of such trees as was desiderated would not only embellish the spots where they were planted, but there might be some hope of teaching the rising generation to take care of young trees. His own experience was that where it took sixpence to plant a standard tree, it took six shillings to protect it. To render it more certain that some planting worthy of the occasion should be done in Edinburgh before the end of the year, Mr. D. T. Fish suggested that some prominent street or streets should be planted, such as Princes Street, from the Calton Hill to the Caledonia Station, Hanover Street, from Princes Street to Golden Acre or Granton, or other suitable streets; and that a special committee of ladies and gentlemen be appointed by this meeting to co-operate or advise with the Town Council in carrying out these objects. On the advice of the President the matter was left in the hands of the Council of the Royal Arboricultural Society.

The proceedings closed with the award of thanks to the Chairman.

Later in the afternoon the members left for Dublin on their annual excursion.

SHROPSHIRE HORTICULTURAL.

(AUGUST 18, 1897.)

THAT a great success would result became a foregone conclusion when once it had become known that the Royal Horticultural Society would join hands with the Shropshire Horticultural Society to hold an exhibition of horticulture in 1897 that should be worthy of the present Victorian Jubilee year. Much of the history of the Shropshire Society has been previously given in these pages. It has been characterised by continued and, in the case of provincial societies, unparalleled success. The income has increased year by year, and its disbursements, besides being large, have been made in support of objects that have commanded general approval. The very last one was a sum of over £1000 to erect the Darwin statue, figured by us in our last issue. There was a mishap on Tuesday in regard to two of the tents; but the energy and resource of the executive did much to lessen the ill-effect that might have been feared. The extent of this show may be imagined from the fact that it required nearly 48,000 square feet of covered area. The deputation from the Royal Horticultural Society included the President, Sir Trevor Lawrence, Bart., and Messrs. H. J. Veitch, T. Statler, S. Courtauld, P. Crowley, J. Douglas, H. Selve Leonard, W. Crump, J. Smith, and the Rev. W. Wilks. The staff of judges employed by the Shropshire Society numbered twenty-six. The entries in the open classes were more numerous than usual, and the quality of the produce throughout was capital. Vegetables and fruit deserve the most unreserved praise. The more important exhibits in all of the open sections are referred to in the subjoined report, but the exigencies of time and circumstance prevent it from being exhaustive, even were such desirable. The weather was not wholly propitious.

Good as previous shows have always been, that held during the present week was undoubtedly the finest yet held. The executive, who are ably supported by the indefatigable Hon. Secs., Messrs. Adnitt and Naunton, did their best to secure such an exhibition as should beat previous records. The schedule was a most remarkable one, notable alike for the liberality of the prizes, and for the comprehensive nature of the classes.

In the plant classes the specimens have been seen in finer condition, but the reason for this has, in a great measure, been explained by the catastrophe of Tuesday last (see p. 127). The group classes suffered in a measure from the same cause; the space at command in the tent erected late on Tuesday, although extensive, did not afford sufficient room for the groups to be seen at their best, but for taste and quality they were first-class.

The cut flower classes throughout were exceedingly well represented, and the competition was invariably keen. About all of these exhibits there was a remarkably fine appearance.

Miscellaneous exhibits, chiefly by the trade, were great attractions, and added largely to the effect.

PLANTS.

STOVE AND GREENHOUSE.—In the large class for twenty plants, not fewer than twelve of which were to be in flower, Mr. J. CYPRER won the 1st prize somewhat easily, having grand examples of the following: *Bougainvillea Cypheri*, a splendid specimen, very rich in colour, with the bracts also of extra size (to this, as a new plant, was the Gold Medal awarded); *Erica Austiniana*, a little past its best, but a splendid plant; *Erica Eweriana*, also good; *Ixora Duffi*, with large trusses rich in colouring; *Ixora Williamsi*, which showed the effects of the crushing received under the first tent; *Statice profusa*, a large plant well coloured; *Allamanda Hendersoni* and *Clerodendron Balfourianum*, both fresh and good; and *Dipladenia Bracleyana*, very well-flowered. The foliage examples being *Kentia Forsteriana*, an immense plant with grand leafage; *K. australis*, also good, and a very large *Livistona chinensis* with superb foliage, also *Croton Johannis* richly coloured, *C. angustifolius*, a fountain of golden foliage, and C. Thompsoni, equally fine in colour with the preceding. One plant intended for this group, an immense specimen of *Cycas circinalis*, could not be staged in consequence of the injuries it had received.

Mr. FINCH, Coventry, who was 2nd, had smaller plants; he too had suffered seriously by the collapse of the large marquee. The best here were *Ixora Williamsi*, good and fresh; *Clerodendron Balfourianum*, good; *Erica Austiniana*, very fresh and clean. Of foliage plants, the best were *Kentia Forsteriana*, *Cycas circinalis*, and *Croton angustifolius*.

For six plants in flower, Mr. J. CYPRER was also 1st, staging a strong lot, viz., *Phenocoma prolifera* Barnesi, a perfect specimen; *Rondeletia speciosa* major, a finely-flowered plant; *Clerodendron Balfourianum*, very bright; also *Erica Aitoniana*, *Statice profusa*, and *Bougainvillea glabra*, all well flowered. Mr. FINCH was 2nd again, his best plants being *Ixora Fraseri*, extra good; *Erica retorta* major, a fine plant; *Stephanotis floribunda*, and *Allamanda Williamsi*, very freely flowered.

For six plants, open to the county of Salop only, Mr. LAMBERT, gr. to Lord HARLEIGH, Brogyntyn Park, Oswestry, was placed 1st, with a fine example of *Ixora Prince of Orange*, profuse in flower; *Dipladenia amabilis*, very healthy and well-bloomed; with a good *Allamanda grandiflora*, a *Croton Warreni*, and *Kentia australis*. Mr. BREMMELL, gr. to H. H. FRANCIS HAYHURST, Esq., Overley, Wellington, was a close 2nd here, his best being *Rhododendron Princess Royal*, a very fine plant, and well-flowered; also *Clerodendron Balfourianum*.

For a single specimen stove or greenhouse plant, Mr. LAMBERT was 1st, with *Dipladenia amabilis*, a fine specimen, the flower of high quality; the 2nd prize going to Mr. FARRANT for a large and good example of *Ixora Williamsi*; and the 3rd to Mr. JONES, gr. to G. BURR, Esq., Oaklands, with an excellent plant of *Bougainvillea glabra*.

FUCHSIAS.—The best six were staged by Mr. J. Carter, gr. to W. J. Scott, Esq., Besford House. These were what Fuchsias should be, in the best possible health, well-flowered, and in good variety: Wave of Life, charming, and Mrs. Rundle being conspicuous (a fine exhibit, and far in advance of any other).

GROUPS FOR EFFECT (FLOWERING AND FOLIAGE-PLANTS COMBINED).—For a group, occupying a space of 450 square feet, Mr. J. CYPRER, in spite of his misfortunes, won the 1st prize in a most creditable manner, the entire group displaying great originality in design, combined with tasteful and effective arrangement. Mr. Cypher has arranged many fine groups previously, but he never surpassed, or even equalled, that now under notice; the greatest charm consisted in the diversity evident throughout when viewed from various standpoints—light Palms, Aralias, and varieties of *Asparagus* with Bamboos, highly-coloured *Crotons*, many Orchids (notably *Dendrobium Phalaenopsis*, *Schroderianum*, and *Oncidium* in variety), formed the chief plants, the feature of the arrangement being a light ground-work, over which were arranged light arches of rustic cork, upon which the plants employed told with the best possible effect. Mr. MEE, Nottingham, was a creditable 2nd, with plants showing first-class culture. The entire group was very bright and effective, but it lacked the originality of design to be found in the 1st prize group; well-developed *Crotons*, highly-coloured, told with good effect; the back part was, however, rather too formal. Mr. FINCH, who was 3rd, had another good arrangement, the plants employed telling with good effect.

FOLIAGE GROUPS EXCLUSIVELY.—In this class, which is a fresh and notable introduction into the show, some excellent arrangements were to be seen. Mr. Roberts, gr. to C. H. WRIGHT, Esq., Halston Hall, Oswestry, was 1st. The qualification in this class being 250 square feet, foliage plants, Ferns, and Palms only being allowed, the group had depth, consequently there was room for employing plants of good size; the centre was a plant of *Kentia australis*, raised about 5 feet from the ground, and towering over the rest, standing very little from the centre of the arrangement; other light Palms were employed, whilst of smaller plants, dwarf *Crotons*, well coloured, and in single stems; foliage *Begonias*, too, were used, but there was a slight lack of such as *Caladium argyrites*, *Eulalia japonica* variegata, &c. Mr. J. CYPRER, who was an exceedingly close 2nd, staged a group more up-to-date in style, of irregular outline; the *Crotons* told most effectively, and the groundwork was very tasteful. Mr. McIntyre, gr. to Mrs. GURNEY PEASE, Woodside, Darlington, was placed 3rd; he too showing an admirable group, which would have looked better if it had been extended over a little more surface, with, in addition, a few more dwarf plants for groundwork.

Two more groups were shown in this class, show it is one which meets with encouragement from exhibitors.

COLEUS.—These are always shown well at Shropshire. On this occasion Mr. Carter, gr. to W. J. Scott, Besford House, took 1st prize with four large pyramidal trusses, and furnished, also highly coloured; Mr. Sutton Lane, being an exceedingly close 2nd.

ZONAL PELARGONIUMS (SINGLES).—Mr. A. MYERS here, with dwarf plants well flowered, and bearing good trusses. For doubles, the same exhibitor was showing plants equally well grown.

CALADIUMS.—The best half-dozen large plants of Mr. R. Lawley, gr. to Mr. R. DABY, Adlote; and best from Mr. Leith, gr. to J. R. GREATORREX, Esq., Hall. (Growers of these should take note of the new with brighter leafage.)

FERNS.—The best half dozen of these were staged by E. Jones, gr. to A. M. BARBER, Esq., Field House, W. the best being *Microlepia hirta cristata*, very neat *Adiantum Farleyense*, with A. Williamsi. Mr. STEVE to Mrs. J. M. SLANEY, Sunnycroft, Wellington, one of his finest being *Adiantum formosum*.

DRACENAS.—Mr. LAMBERT was 1st for six vases, with an 1 healthy, with foliage down to the pots, nearly broad-leaved forms. In the 2nd prize a lot from M. mell, D. Doucetti, was very good, and the rest well, but rather small.

BEGONIAS (TUBEROUS).—The first prize was awarded JONES, who had dwarf plants of double varieties; 1 gr. to R. TAYLOR, Esq., Abbey Forge, being 2 larger plants of singles.

GLOXINIAS.—The best dozen were staged by J. SMITH, Esq., Abbotsmead, he having bright and a varieties: Mr. Dawes, gr. to A. E. W. DABY, Esq., Ness, Shrewsbury, was 2nd, with plants equally 1 not so good in quality.

TABLE PLANTS.—Mr. MCINDOE was 1st in this class, admirable examples of what table plants should be, clean, and well furnished; Mr. McIntyre, gr. GURNEY PEASE, Woodside, Darlington, was a close 2nd of similar style and character.

MISCELLANEOUS COLLECTION OF THIRTY PLANT JONES took 1st in this class with dwarf, well-examples of *Vincas*, *Statice*, *Begonias*, &c.; Mr. being 2nd, with another good collection.

CUT FLOWERS.

DECORATIONS.—Following the order of the scheme will commence with the class for a display of floral ments. As usual, Messrs. PERKINS & SONS of 4 were 1st with a charming combination of arrangement, baskets, vases, arches, and bouquets. As *Croton* leaves, and other foliage and grasses were used effectively with *Roses*, *Carnations*, the *Orchids* used for decoration, and other flowers. The large central *Orchids* was especially good. The wild *Clematis* was good deal in this exhibit. 2nd, Messrs. JONES Shrewsbury. This was a good exhibit, though it is English of the former. A basket of *Anthuriums* was several small baskets of *Orchids* were pretty; 3rd, M. STEVENS, of Birmingham, whose exhibit was too.

For a ball-bouquet and bridal-bouquet Messrs. P. SONS were again 1st, their style and material being to that in the previous class; the colours were blended. 2nd, Messrs. JONES & SONS, with similar such good arrangements; 3rd, Messrs. POPE & SONS Norton, whose colours did not quite blend.

In a similar class, from which *Orchids* were used, Mr. J. R. CHARD, of Stoke Newington, was 1st; his bouquet was very light and pretty.

In the class for a bouquet of *Cactus D. hlias* only Messrs. POPE & SONS produced a charming exhibit, show can be done with a heavy flower like the *Dahlia*; this was Countess of Radnor, which was mixed with variegated foliage; this was much admired. 2nd, J. SEALE.

MESSRS. POPE & SONS were also 1st for bouquets Peas and *Roses*. The best stand came from Mr. J. R. 2nd, Mr. F. W. SEALE.

HARDY FLOWERS were illustrated in a strong contrast. The 1st prize was awarded to Mr. W. F. GUNN, Bir who whose exhibit was most meritorious and representative. *Herbaceous Phloxes* here were very good. Messrs. & SONS, Aberdeen, were 2nd. In this exhibit *Chimnum maximum* was very fine, also *Scabiosa caucasica*, *Echinops phaeocephalus*; 3rd, Mr. M. CAMPBELL Blantyre, who showed the pretty, but seldom seen *thalamum salicifolium*.

For a collection of bulbous and tuberous-rooted plants Messrs. HARRIS & SONS, Bedford, were a very good splendid *Gladioli*, good *Liliums*, *Mom-bretias* and *Liliums* a *platyphyllum*, *Hemvi* and *Leichboldi* mentioned. 2nd, Messrs. BARR & SONS; 3rd, M. WALLACE & SONS, Colchester, both with good exhibit latter contained *Lilium Maximoviczii*.

A class was provided for a large group of *C* arranged with their own foliage. Mr. M. CAMPBELL with splendid bunches, well staged. Some so-called staged, including Mrs. D. Dunlop and Snowball, gr. 2nd, Messrs. LIVING & MATHER, Kelso, who had varieties of border *Carnations*.

In the class for a collection of *Gladioli*, Messrs. J. & SONS were 1st. Their exhibit was magnificent,

varied. Thermidor, Grande Rouge, Enohantrees, and Dr. Bailey were selected as particularly good. The colours were brilliant. The 2nd prize was not awarded.

Messrs. D. & W. CHOLL, of Dundee, staged a large collection of Roses, and were placed 1st, button-hole and polyantha varieties were well represented; 2nd, Messrs. POPE & SONS.

Several large collections of Dahlias were exhibited. Mr. F. W. SHALL staged the most representative collection, and was 1st. His singles and Pompons were good. Some promising seedlings of these classes of Dahlias were to be seen. The arrangement would be more effective if foliage, other than that of the Dahlia, were allowed; Messrs. KEYNES, WILLIAMS & Co., were placed 2nd. Their collection was well arranged. It consisted chiefly of Cactus Dahlias of splendid quality. The following seedlings will be heard much of in September:—Britannia, Arachno, Mary Service and Keynes' White, the best white Cactus so far. Some good Show Dahlias were also staged; 3rd, Messrs. JONES & SONS of Shrewsbury.

Messrs. POPE & SONS had a good exhibit; but, unfortunately, used other foliage in the arrangement.

For twenty-four Dahlias, Mr. S. MORTIMER, Farnham, Surrey, was 1st; Mr. B. BRIAN, Longton, Staffs., 2nd.

For twelve bunches of Cactus Dahlias, Messrs. KEYNES, WILLIAMS & Co., were a very good 1st; Cyole, Sturfish, and Lady Penance were good, as well as several seedlings, of which Keynes' White calls for special commendation. 2nd, Mr. F. W. SHALL.

For eighteen varieties of Sweet Peas, T. ALDERSEY, Esq., Belle Vue, Shrewsbury, was a good 1st.

For forty-eight out Roses, Messrs. J. COCKER & SONS were 1st with good Horace Vernet, A. K. Williams, &c.; Messrs. D. & W. CHOLL 2nd; Messrs. HANKINS & SONS 3rd.

For twelve bunches of stove and greenhouse flowers the awards were:—1st, G. H. KENYON, Esq., Edgbaston; 2nd, Sir J. W. FRANK, Bart.; 3rd, Lord HARELICH, Brogyntyn.

FRUIT.

Fruit, as usual, was shown largely and well. THE VICTORIAN CLASS, intended to illustrate the fruit produce of British gardens, provided sixty-five dishes of fruit, arranged on side tables, in space 16 feet by 4½ feet, artistically displayed with cut flowers, foliage, and not more than twelve plants in pots not exceeding 5 inches in diameter. The fruit was to be selected from a list published in the Shropshire Horticultural Society's schedule, including representative kinds and varieties of both house and outdoor fruits. Three competitors entered in this class, and each made a creditable display. Mr. McINDOE, gr. to Sir JOSEPH PEASE, was a decided 1st, winning £30 and the Gold Medal of the Fruiters' Company, his produce including plants in the background immediately behind and above the sixteen splendid bunches of Grapes, eight black and eight white, cut flowers, and fruits. (Crotons, Palms, Arafias, and Eucharis amazonica, and trailing Moss, Orchid flowers, Caladium Argyrites, in pots, enclosed in scarlet bags, which together with the sp. eye of Fern, &c., contrasted effectively with the white cloth.

Grapes Alnwick Seedling, Gros Maroc, Gros Guillaume, and Black Hamburgh, faultless in size, shape of bunch, and colour of berry. Muscat of Alexandria, Buckland Sweetwater, Duke of Buccleuch, and Bowood Muscat, all very fine. Melons Darwin, Scarlet Model, and Magnum Bonum; two nice Queen Pines, Tomatoes, Peaches, Nectarines (Lord Napier); Apples, including two grand dishes of Gasconne scarlet; Pears Souvenir du Congrès, Brown Turkey Figs, Bananas, Cherries, Oranges, Plums, Gooseberries, Red and White Currants, Apricots, Plums in variety, and Filberts. This collection received 321 points, and in addition to the 1st prize already mentioned, was awarded a Silver-gilt Knightian Medal from the Royal Horticultural Society.

The fruits displayed were of the highest quality from the fruit grower's standpoint, and the arrangement was most artistic.

Mr. DAWES, gr. to Mrs. INGRAM, Temple Newson, Leeds, was 2nd (297 points). The bunches of Gros Guillaume, Madresfield Court, Black Hamburgh, Buckland Sweetwater, and Gros Maroc Grapes, were exceptionally fine in this class, as also was a fine cluster of Bananas.

Mr. GOODACRE, gr. to the Earl of HARRINGTON, Elvaston Castle, was a good 3rd, his back dishes, Grapes, Pines and Melons, being strong; the front and middle dishes rather weak. Mr. Goodacre's background of grasses and flowers was good.

Collection of Fruit, 9 dishes: 1st, Mr. BRENNELL, who had five Muscat of Alexandria and Black Hamburgh Grapes, Peaches, Nectarines, Figs, Apricots and Pears. Lord Trevor was 2nd, and Mr. LANGLEY was 3rd.

DECORATIVE DESK-TABLE.—Five very tastefully-arranged tables were put up—glass filled with Orchids and intermixed with light sprays of Ferns and Asparagus. Mr. GOODACRE was 1st for a light and effectively-arranged table, whereon was staged fruit of the best description, including a large Queen Pine, having large, well-developed, brightly-coloured pipe; long tapering bunches of Muscat of Alexandria, Black Hamburgh and Muscat Hamburgh Grapes; Peaches, Nectarines, Brown Turkey Figs, Pears, Transparent Plums, Countess Melon, and Moor Park Apricots (103½ points). The "Veitch Memorial" Medal was awarded to this capital exhibit. Mr. McINDOE was a good 2nd, being awarded 104½ points. Mr. HARRIS (Eastnor Castle Gardens, Ledbury), was a good 3rd (99½ points).

GRAPE made a grand display in themselves (334 bunches being staged), and were of a high order, being large in bunch and berry, and well finished. In the class for four bunches

of Black Grapes, two bunches of two varieties, twelve stamps were staged. Mr. DAVIS, gr. to Rev. T. ANDERSON, Welsh Frankton, Oswestry, was 1st, staging good bunches of Gros Maroc and Black Hamburgh, fine in every respect; Mr. Lambert, gr. to Lord HARELICH, Brogyntyn, Oswestry, being a very close 2nd, showing handsome well-finished bunches of Gros Maroc and Madresfield Court; Mr. Langley, gr. to Rev. T. M. BUCKLEY, Owen Tedamore Hall, West Felton, was a fair 3rd, showing heavy bunches of Madresfield and Black Hamburgh, requiring a little more colour to make them perfect.

In the class for four bunches of White Grapes, two bunches in two varieties, seven lots were staged. Mr. J. Campbell, gr. to C. E. NEWTON, Esq., Mickleover Manor, Derby, taking 1st prize with fine bunches of Muscat of Alexandria and Cannon Hall, the berries being large and beautifully coloured; Mr. LAMBERT securing 2nd place with Muscat of Alexandria and Buckland Sweetwater.

TWO-BUNCH CLASSES.—Thirteen pairs of Black Hamburgh were staged, Mr. BRENNELL, gr. to H. H. FRANKO HATHURST, Esq., Overley, Wellington, being a good 1st; Mr. HARRIS, gr. to Lady HENRY SOMERSET, Eastnor Castle, Ledbury, being a close 2nd.

Black Alicante.—Six stands were shown, Mr. DAVIS being a good 1st, staging heavy bunches, fine in berry and colour; Mr. GOODACRE, gr. to the Earl of HARRINGTON, Elvaston Castle, Derby, being 2nd.

Madresfield Court was represented by four exhibits, Mr. LANGLEY securing 1st position, showing good examples of this fine Grape.

GROS MAROC was represented by eight stands, the bunches being of good size and shape, and the berries large and well-coloured. Two medium sized bunches, consisting of extra large berries and beautifully coloured, secured 1st prize for Mr. GOODACRE, Mr. LAMBERT taking 2nd place, and Mr. F. JORDAN, Impney, Droitwich, 3rd.

Muscat of Alexandria.—Mr. NEILD, representing the "Cheshire County Council," Holmes Chapel, Cheshire, took 1st prize with large bunches, fairly well coloured; Mr. Fyfe, gr. to Lord WANTAGE, Lookinge House, Wantage, was 2nd.

In the Any Other White Grape Class, Mr. DAVIS came to the front with good bunches of Buckland Sweetwater; Mr. McDonald, gr. to W. B. MARLING, Esq., Clanna Sydney, Glas., was 2nd; seven lots were shown.

CLASSES CONFINED TO THE COUNTY OF SALOP.—Mr. LAWLEY was 1st, for two bunches of Black Hamburgh, compact, well-coloured bunches; Mr. DAVIS being 2nd with less compact but equally well-coloured bunches.

In the Any Other Black Class Mr. CARR, gr. to Sir OFFER WAKEMAN, Bart., Yeaton Peverry, was 1st with Madresfield Court; Mr. BRENNELL was 2nd with Gros Maroc.

Muscat of Alexandria.—Mr. CARR was a good 1st (out of seven exhibits), showing good solid bunches, fine in berry and fairly well coloured.

Two nice well-coloured bunches of Buckland Sweetwater secured 1st prize for Mr. LAWLEY in the Any Other White Class; Mr. CARR taking 2nd place with Foster's Seedling, fine in size and shape of bunch, size and evenness of berry, but requiring more time to colour.

AMATEUR CLASSES.—Mr. BURR, Oaklands, had the best two bunches of Black Hamburgh; and Mr. BARBER, Wellington, had the best pair of white Grapes, showing Foster's Seedling, MELONS (forty-two in number) were shown well. Mr. Townsend, gr. to Col. R. T. LLOYD, Aston Hall, Oswestry, had the best scarlet-fleshed variety, a nice Blenheim orange; Mr. Durnell, gr. to — KENYON, Esq., West Felton, Oswestry, was 2nd.

Mr. KIGNERSTAY, Leighton Hall, Trowbridge, had the best green-fleshed variety in Earl's Favourite; Mr. Birch, gr. to Mrs. WATKINS, Shotton Hall, being 2nd with the same variety.

NECTARINES.—Twelve good dishes of Nectarines were shown, Mr. HARRIS being 1st, showing beautiful fruits of Pitmaston Orange, of fine colour; Mr. McDONALD being 2nd with good fruits of Lord Napier.

PEACHES.—Out of fifteen dishes of Peaches Mr. Robinson, gr. to R. W. D. HARELY, Esq., Herefordshire, was 1st, with large even-sized fruits of Sea Eagle well coloured; Mr. G. Taylor, gr. to C. A. JONES, Esq., Carnarvon, taking 2nd with Barrington, fine in every respect.

APRICOTS.—Out of seventeen dishes of Apricots staged Mr. Bible, gr. to Lord Trevor, Brynkinalt, Chirk, was 1st with Moor Park; Mr. ROBINSON was 2nd.

PLUMS.—Mr. POPE, gr. to the Earl of CARNARVON, Highclere Castle, Newbury, had the best dish of Dessert Plums, showing fine fruits of Guthrie's Gage; seven lots were shown.

The Rev. T. M. BUCKLEY had the best dish of Culinary Plums, staging a grand dish of Prince Englebert; eight lots were shown.

CHERRIES.—Mr. BRENNELL had the best out of nine dishes of Cherries, showing a fine dish of Morellos; Mr. Walker, gr. to Sir R. HONYMAN, Bt., Colm, Whitechurch, was 2nd.

APPLES, Culinary and Dessert, were represented by fourteen dishes. The Hon. Mrs. KENYON, Whitechurch, had the best dish of dessert, showing Beauty of Bath.

PEARS.—Thirteen dishes of Dessert Pears were staged. G. F. WARD, Esq., Hadnall Hall, Salop, was 1st with Louise Bonne of Jersey.

VEGETABLES.

For nine distinct kinds of Vegetables, Messrs. BUTTON & SONS offered a cup valued at £5 5s., and £3 in money, as well as five other prizes. Ten splendid lots were staged, and the coveted honour was won by MORGAN WILLIAMS, Esq., Glyn Neath, Glamorgan (gr. Mr. Forley). Sutton's Solid White Celery was a marvellous exhibit, Alls Craig Onions of wonderful size, Prizetaker Leek large and good, New Beet, Intermediate Carrot in every way, Satisfaction Potato, Perfection

Tomato, Improved Blood Red Beet, Prizewinning Runner Beans. The 2nd prize went to Mr. POPE, who had a fine lot of produce, the collection being the same as that which won for him 2nd place in the first-named class; Alls Craig Onions, Perfection Tomatoes, and New Red Intermediate Carrot were his best dishes.

Messrs. J. CARTER & Co., High Holborn, London, offered six prizes for collections of nine distinct kinds, the 1st prize being £10, and the 2nd £5. Eight lots were staged. The coveted award was won by Miss TALBOT, Penrice Castle, Swansea (gr. Mr. Milner), who staged a very fine exhibit—consisting of Model Leek, grand; Autumn Giant Cauliflower, large and good; Intermediate Carrot, fine; splendid Jersey Lily Turnip, and good Perfection Tomato, Supreme Potato, Alls Craig Onion, and Duke of Albany Pea; 2nd, Mr. TOWNSEND.

POTATOES were shown largely and well, the tubers very well selected, even, and clean. Mr. C. FOSTER, gr. to MORGAN S. WILLIAMS, Esq., Glyn Heath, Glamorganshire, was 1st for three dishes, with Windsor Castle, Satisfaction, and Abundance, Mr. POPE being a capital 2nd with Satisfaction, Reading Russett, and Matchless.

Mr. WAITE had the best single dish, showing Windsor Castle.

Mr. FOSTER had the best collection of five varieties, showing fine tubers of Abundance, Reading Russett, Windsor Castle, Tennyson mottled with brown, and Boston, a good even clean lot of tubers.

PEAS.—Six lots of Peas, consisting of three dishes each were put up for Mr. ECKFORD'S Prizes. Mr. W. POPE, gr. to Hon. Mrs. E. KENYON, Melspen, Whitechurch, was 1st, showing Eckford's Rex, Eckford's Prior, and Eckford's Magic.

RUNNER BEANS were shown in good condition for the season, Mr. POPE (Highclere) being 1st with Sydenham's No Plus Ultra.

TOMATOES (for Mr. SYDENHAM'S prizes) were staged in good condition. Mr. Leith, gr. to J. R. GRAYTORREX, Esq., Myton Hall, Shrewsbury, was 1st out of twelve lots shown.

TURNIPS were shown in large numbers and in fine form. Mr. TOWNSEND was 1st in a strong competition.

ONIONS made a good show. Mr. WILLIAMS, Neath, had the best dish of nine spring-grown bulbs.

Mr. WAITE had the best dish of autumn-sown bulbs. This exhibitor also had the best dish of Parosips.

Several special prize schemes were devoted to Tomatoes (Runners), Carrots, &c.

MISCELLANEOUS EXHIBITS.

Messrs. J. VEITCH AND SONS, Chelsea, had a *recherché* group of Stove and Greenhouse plants, comprised chiefly of new or rare plants; Caladiums were very conspicuous, rich in colour and sturdy in growth, the best being of dwarf kinds, Le Nain Rouge, dwarf red, a fine for grouping; Chelsea Gem, a paler shade, very bright; and Baroness Schroeder, a creamy buff with crimson veins, and of larger kinds, B. S. Williams, fine in leafage; Baronne Adolphe De Rothschild, a deep metallic red, very fine, and Major Jockey, red on a pale coppery ground. Other choice specimens comprised Heliconia illustria rubricaulis, Phrynium variegatum from Baron Frank Selliers, Nepenthes mixta, N. Dicksoniana and N. Hookeriana; smaller plants were represented by the newer Dracenas, choice Ferns, some beautiful little plants of Rhododendron and of Lily of the Valley, which as massed had a beautiful effect; Exacum macranthum should also be noted, being in first-class character.

Messrs. J. VEITCH & SONS were awarded the Gold Medal of the Royal Horticultural Society, as offered by them specially in the schedule, for the exhibit (not for competition) which, in the opinion of the Council of the Royal Horticultural Society, best represents the progress of horticulture for the past sixty years. In addition, Messrs. VEITCH secured one of the three special Victorian Awards, viz., a full Desert Service of the value of £12 12s., for the most attractive display of rare plants. Another of these awards went to Messrs. JONES & SON of Shrewsbury for an extensive display of out flowers in great variety.

Messrs. KER & SONS, Alburgh Nursery, Liverpool, staged a lovely group of Crotons, small and medium sized plants, superbly coloured; the best of these were Prince of Wales, Reddi, Gordoni Morti, interruptus aureus, also several other choice kinds, the whole representing thoroughly the decorative value of the Croton when grown as these plants were, the whole forming a superb exhibit.

Messrs. COWAN, Liverpool, staged a large group of Roses in pots, dwarf plants, Lilies and Orchids, the latter consisting chiefly of Cattleyas, the whole being finished off with dwarf foliage plants, making a good display.

Mr. T. S. WARE, Tottenham, staged a long table of tuberous Begonias, arranged in a tasteful manner, and consisting of the finest single and double named kinds, remarkable alike for quality of flower and high-class culture.

Messrs. R. SMITH & Co., Worcester, arranged a large group of decorative flowering and foliage-plants with cut flowers, the chief features being the Gloxinias, Montbretias, and Lilies, with Bamboos.

Messrs. BACKHOUSE & SONS, York, showed a selection of the best Bamboos, tall and healthy plants, very light and elegant; also, Asparagus deflexus, and examples of their rockwork furnished with growing plants, which comprised a choice selection.

The third of these awards was made in favour of Messrs. FRITCHARD & SONS, Shrewsbury, for the most novel exhibit illustrating the progress of horticulture during the last sixty years; this consisted chiefly of Cannas in the best new varieties Ferns, and other present day plants and fr

From Mr. J. Hudson, gr. to LEOPOLD DE ROTHSCHILD, Esq. Gunnersbury House, Acton, came a collection of twenty-two varieties of hardy Water Lilies, mostly new. The best reds were N. Ellisiana and N. marliacca rubropunctata; N. marliacca alba was of large size, N. odorata sulphurea and N. pynosa helvola were prominent yellows. Of rose-coloured varieties, N. odorata rosacea and N. o. exquisita were good. The Gold Medal of the Shrewsbury Society and the Silver-gilt Flora of the Royal Horticultural Society were awarded.

Messrs. DICKSONS, Chester, staged a huge bank, chiefly of hardy flowers and small table plants. This was an exhibit of great merit, and very representative. Romney Coulteri, the Tree-Poppy, is a lovely white flower of large size, the white petal contrasting well with the yellow centre; it deserves to be more frequently seen. Platycodon Mariesii and P. Mariesii alba were exhibited. Crinum grandiflorum was good.

From Mr. A. MYERS, Florist, Shrewsbury, came a large collection of zonal Pelargoniums, and some well-flowered dwarf specimens of Campanula pyramidalis.

Mr. M. CAMPBELL staged Dahlias in variety, and good single annual Chrysanthemums, Princess May, Golden Gem, and Chieftain, &c.

Messrs. DOBBIE & Co. brought a large quantity of Dahlias Cactus and Pompon, Carnations, Violas, &c.

Mr. E. R. DAVIS brought a grand lot of tuberous Begonias from Yeovil Nurseries; some of the best were Victoria Regina, dark red; Mrs. Stothert, pale yellow; Mrs. Richmond, flesh colour; Ariel, white.

Messrs. W. & J. BIRKENHEAD, Fern Nurseries, Manchester, staged a large quantity of Ferns in considerable variety, British and exotic.

Mr. S. MORTIMER staged a large collection of show and Cactus Dahlias of first-rate quality. The best Cactus were Fusilier, Starfish, and Mrs. Wilson Noble.

Mr. E. MURRELL, nurseryman, Shrewsbury, staged an extensive and very good collection of Roses and Gladioli.

Messrs. JONES & SONS, Shrewsbury, put up a varied and extensive collection of Dahlias in variety, and hardy flowers, including annuals, well and effectively staged.

Messrs. CARTER, High Holborn, London, brought an exhibit of flowers in pots and cut. The staging was good.

Mr. J. H. WHITE, nurseryman, Worcester, staged hardy flowers, Grapes, and a new Tomato, "Majestic," of large size.

Messrs. PROCTOR & SON, Chesterfield, brought Carnations in variety. Messrs. WEBB, Stourbridge, were also represented.

Mr. ECKFORD, Wem, Shropshire, staged Sweet Peas in great variety, and of good quality.

Mr. W. F. GUNN had a meritorious collection of hardy flowers.

Medals Awarded by the Royal Horticultural Society.

GOLD BANKSIAN.

Messrs. Jas. Veitch & Sons, Ltd., Chelsea, for best representative Victorian Era Group.

SILVER KNIGHTIAN.

Earl of Harrington (gr. J. H. Goodacre), for Decorative Dessert-table.

SILVER-GILT KNIGHTIAN.

Sir J. Pease, Bt., Hutton Hall (gr. J. McIndoe), for his exhibit in Victorian Fruit Class.

SILVER BANKSIAN.

Mr. A. Myers, Shrewsbury, for Fuchsias; Messrs. J. Cowan & Co., Ltd., Garston, Liverpool, for Group of Tea Roses, Lilies, and Orchids; Mr. T. Pritchard, Shrewsbury, for Collection of Vegetables; Mr. A. Myers, Shrewsbury, for Zonal Pelargoniums; Messrs. DOBBIE & Co., Rothsay, N.B., for Dahlias, &c.; Mr. M. Campbell, Blantyre, N.B., for Carnations and Picotees; Earl of Carnarvon, Newbury (gr. W. Pope), for Collection of Vegetables; Morgan Williams, Esq., Glyn Neath (gr. C. Foster), for Collection of Vegetables; C. E. Newton, Esq. (gr. J. Campbell), for Muscat Grapes.

SILVER FLORA.

Messrs. R. P. Keir & Sons, Aigburh, Liverpool, for Crotons; Mr. J. S. Ware, Tottenham, for Tuberous Begonias; Messrs. R. Smith & Co., Worcester, for Group of Plants; Mr. B. R. Davis, Yeovil, for Tuberous Begonias; Mr. E. Murrell, Shrewsbury, for Roses and Gladioli; Messrs. Harkness & Sons, Bedale, for Collection of Hardy Buds and Tuberous Flowers.

BRONZE BANKSIAN.

T. Birch, Shrewsbury, for Collection of Vegetables; Miss Talbot, Swansea (gr. R. Miller), for Collection of Vegetables.

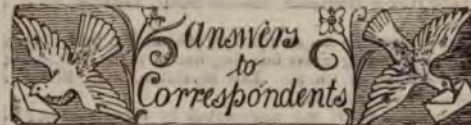

PRESENTATION TO THE SECRETARIES

A pleasant incident in connection with the show was a presentation to Messrs. H. W. Adnitt and W. W. Naunton, the Hon. Secretaries. A committee was formed some weeks ago, Mr. A. Outram acting as secretary, and Mr. O. Thomas as treasurer. Sufficient funds were easily raised for the purchase of two handsome silver centre-pieces for the dinner-table. Each bore the name of the recipient, and the words, "Presented by horticultural friends, in recognition of services to horticulture." Sir Trevor Lawrence made the presentation. All who have any knowledge of the Shropshire Society will know how well the gentlemen have deserved this recognition.

Obituary.

WILLIAM FOWLER.—The death is announced of Mr. W. Fowler, head gardener at Clifton Park, Baltimore. Deceased was born at Kelvin Grove, near

Glasgow, in 1822, and commenced his horticultural career in the Glasgow Botanic Gardens. He afterwards went to Kew, and remained there until 1848. In that year he went to America, and subsequently to Australia. Returning to America, Mr. Fowler was engaged by the late Jno. Hopkins upon the Clifton Estate. It was the intention of Mr. Hopkins to have the university bearing his name established on the Clifton ground, and at the same time to have Mr. Fowler plan and lay out a botanical garden there, but through the untimely death of Mr. Hopkins the plan fell through. Mr. Fowler, who was at Clifton forty years, planted many rare trees and Conifers there, but some of these were cut down and grubbed out last season. A considerable number of horticulturists attended the interment on the 26th ult.

BULBS: *Subscriber.* If you read French, as you probably do, you will find Guichéneuf's *Les Plantes Bulbeuses*, Paris, Octave Doin, suitable for your purpose.

CARNATION SEEDLINGS: *D. & M.* The flowers were considerably withered when they reached us. Several of them are well worth cultivating, but we do not recognise anything unusually superior in them. Their exact value could only be determined after seeing them in perfect condition, and ascertaining the habit of each variety in comparison with similar ones previously raised.

CHRYSANTHEMUM: *Ambitious.* 1. The Edinburgh Society allow exhibitors to place in the vases Chrysanthemum foliage other than that growing on the actual stems containing the blooms exhibited. The committee found that the foliage upon the stems containing the blooms does not keep fresh, thus this was detrimental to all the exhibits. Hence the concession to all alike. 2. The appearance of incurred Japanese blooms can be slightly improved by removing misformed petals, beyond this they are not dressed like the ordinary incurved section. 3. Cut the blooms with sufficient stem, wrap the base with wet moss, covering the moss with paper; wrap the whole stems and blooms in soft tissue-paper, taking care to have all the leaves erect in the paper. Lay the stems in a long shallow box, one bloom resting at the base of its neighbour. Do not lay one upon another. *E. M.*

CLUB ON MELONS: *Subscriber.* You probably mean eel-worms; if so, you can do nothing but burn the plants, turn out the soil, and get fresh.

CORRECTION.—In the fifth line of my letter to you, p. 111, the word "same" has been rendered "cause," thus making me say the very opposite of what I intended. *R. D. Blackmore.* [We can only express our contrition. *Ed.*]

CUCUMBERS: *E. J.* The plants are weakly, but the roots are healthy, and we see no sign of actual disease. Probably your treatment has been, or is, at fault.

CUCUMBERS—TOMATOS: *A. A. L. G.* Any flat basket or box would answer for Cucumbers if properly packed with moss or wood-wool. Tomatos should be sent in flat boxes or baskets with a cross handle, and holding about a dozen pounds. We do not know at the moment where they can be obtained, but the salesman would probably provide them on application.

FIGUS ELASTICA: *Hortus.* We are unable to say what has caused the injury, but it is most improbable that it has arisen from cold or wind.

FRUIT TREES ON LAWN: *Richmond.* You cannot do better than give the trees plenty of liquid from farm-yard manure. It may be applied when most convenient, but preferably in spring and early summer.

INSECT ON PEARS: *M. C.* Your leaves are eaten by the slug-worm, *Selandria atra*, a species of sawfly, frequently described and figured in these columns. Dust the leaves with tobacco or hellebore-powder, but take care not to do so when there is any fruit ripening.

INSECTS: *Miss B.* A fossorial Hymenopterous insect, of the numerous genus *Crabro*. The flies are dragged into the burrows as provision for its grubs. *R. McL.—E. W.* A caterpillar of the

"Elephant" Hawk-moth (*Chorocampa elp*) about to change to chrysalis when received feeds on *Epilobium*, *Fuchsia*, &c. *R. McL.*

MELONS: *T. B.* We should prefer not to give Melons carrying fruits of much size. It induces them to crack.

NAMES OF FRUITS: *R. V. & S.* Apple: produce some local sort not known here; Peach: *Pro Violette Hative.—T. B., Esq.* Apple: *Sudeley.*

NAMES OF PLANTS: *Correspondents not named in this issue are requested to be so good as to send the following number.*—*E. The other specimen was not found, had probably fallen from the box, which was broken.—*A. H.* *Gongora galeata*.—*G. H.* *Catasetum macrocarpum*. It is interesting to see that your treatment of the *Gloxinias* continues to be successful.—*G. W. H.* *Paulownia imperialis*. *T. D.* Matter insufficient for determination. *Ontario*, *Melilotus alba* alias *M. leucantha*.—*H. Hamburgh.* *Encephalartos Ghellinkii*, of *Lehm*.—*E. A. W.* *Ulmus montana* var. *Pittier*. *J. H.* 1. *Conoclinium lanthimum*. 2. *S. latifolia*. 3. *Veratrum nigrum*. 4. *Thalictrum minus*. 5. *Colutea arborescens*. 6. *A. rupestris*.

PANSY: *T. B.* Your question is by no means what you send is a Pansy flower from a worn plant, which has probably flowered in spring and is now for the time exhausted.

PEAS DISEASED: *J. C., Shadwell.* The disease is due to the presence of the Pea-mildew, *Peronospora viciae*. As the disease appears to be well established with you, spray at intervals of ten days with solution of potassium sulphide, as a preventive from the time the Peas are 4 inches high until bloom appears. *G. M.*

PINK AND VIOLET-ROOTS: *V. D.* We find no sign of eel-worms, but the plants have been too deeply buried in the soil.

RASPBERRY CANES: *W. B. H.* The fungus *Pleospora vulgaris* is the cause of the mildew. Collect and burn all diseased canes; if they are allowed to remain the fungus continues to grow throughout the winter, and inoculates the young canes in the spring. *G. M.*

SWEET PEAS: *S. R. V.* For the best Sweet Peas for market work, consult Mr. Eckford, of Salop. Your other question may be addressed to Messrs. Kelway, Langport, Somerset.

TOMATO: *Anxious.* The leaves are attacked by fungus, *Cladosporium fulvum*. It is too late to do much beyond removing the leaves and burning them. Another year an occasional spray with Bordeaux Mixture will be useful as a preventive.—*J. G.* Your fruits are affected with spot, so often figured and described in *Gardener's Chronicle*. You can do nothing now but burn affected fruits. Another season try spraying with Bordeaux Mixture, soon after the flowers fall upon the leaves once or twice during growth.

TREE CARNATIONS: *L. H. S.* In the *Cornwall Manual* (Cassell & Co.) are two chapters devoted to this subject; the cost is a few shillings.

VINES: *Perplexed One.* To induce your Vines to colour well, get the canes thoroughly well pruned each autumn. Do not over-crop. See that the borders are well-drained and sweet, and give a good supply of air to the house whilst the berries are ripening with a little warmth in the hot-water pipes. You may have to continue the heat a little longer than the case of Gros Colmar. You can syringe Peach trees with nothing strong enough to scale that would not also injure the fruit. You might kill the scale with a small quantity of methylated spirits, but keep it from the leaves. When the leaves have fallen, the task will be more easy.

THE Gardeners' Chronicle.

SATURDAY, AUGUST 28, 1897.

THE INTERIOR OF WESTERN AUSTRALIA FROM A HORTICULTURAL POINT OF VIEW.

WERE it possible for a botanist, without knowing in what part of the world he was, to find himself upon one of the low hills which rise from the great elevated table-land of the West Australian desert, he would see in every direction an apparently dense forest reaching far as the eye could follow it. The landscape might here and there be diversified by great masses of bare granite projecting from the verdurous maze, or in some distant valley a stretch of dazzling white would tell of the presence of a salt lake; but the main fact impressed upon his imagination would be the luxuriant covering of vegetation stretching out before him, mile after mile, to the very verge of the horizon, where it would stand as if embossed against the brilliant blue, in a fashion quite unknown to inhabitants of, or visitors to the moister climates of Europe.

Were our botanist now told that he was stationed in the midst of a desert, with an annual rainfall of not more than from 3 to 5 inches, tempered with long spells of fierce drought, his incredulity would surely have some excuse, and yet be entirely without foundation. But he would begin to doubt his first impressions on descending to the plain. Here he would at once notice, between the sparsely-placed shrubs or trees, large patches of loamy-red, or may be of loose and glistening white sand, of which the only occupants would be a few struggling blades of grass, for the most part dry as tinder, clustering wherever a bit of shade might seem to promise some alleviation from the sun's burning rays. Life there would be none, except possibly for some scared and hurriedly fleeing lizard; though swarms of flies, intent on making life a burden to the rash explorer of their dreary domain, would certainly attend his progress. Over all a stillness as of death, save that now and again some faint breeze would quicken the listless Gum-trees, making their leaves sparkle like so many tiny mirrors; or a stronger wind, suddenly arising, to pass away as suddenly, seize in its mighty grasp whatever happened to be near, while a column of red dust, hurled skywards, would mark its triumphal progress. Nor, upon further inspection, would still plainer signs of an inhospitable climate be wanting. Leaves might be seen wilting on their stalks; branches, dead and dry, still attached to a trunk manifesting some show of life; perhaps a flower or two, faded and dried before the seed had been set, or young fruits scorched ere time had been given them to lay on a sufficient thickness of protecting tissue. Signs such as these would all tend to convince our wanderer that no attempt had been made to deceive him, and that in spite of appearances from the hilltop, his present lot was cast in a veritable desert.

But there is a reverse to this picture. After heavy rain—alas! a very occasional blessing—or in early spring, before the sun has regained its power, the botanist may, in favourable situations, find a fair number of floral treasures. Springtime is certainly the most profitable for collecting, as then numbers of lowly annuals, which could not possibly exist when the sun begins to scorch the ground, put in a welcome appearance, so enlivening the country as to make one confess that the desert is not altogether without its share of beauty. Nay, we have seen specially favoured spots where dense masses of pink, snow-white or yellow everlastings, made a foreground which, one might venture to aver, would have been pleasing even to such masters of colour as Titian and Millais. These pink everlastings are the well known *Helipterum Cassinianum*, more familiar in cultivation as *Schoenia Cassiniana*; the yellow are chiefly *Waitzia corymbosa*, *Helichrysum semipapposum*, and *Helipterum Haighii*, the two latter well worthy of being introduced into gardens, especially *Helipterum Haighii*. *Podolepis pallida* is a lovely yellow everlasting, much in the style of *Podolepis acuminata*, but with heads a little smaller. We saw one spot—the flank of a great granite outcrop not far from Coolgardie—covered with the pale golden nodding flower-heads of this plant, forming a literal “field of cloth of gold,” and a fine sight it certainly was. Of white everlastings may be mentioned the abundant *Cephalopterum Drummondii*, whose picturesque massed flower-heads mark it as a meritorious aspirant to the honours of cultivation; *Helipterum rubellum*, equally abundant and, in spite of its specific name, usually showing white involucres, and *Helipterum Fitzgibboni*, with curiously flat heads, recalling somewhat those of the double Daisy, and chocolate outer involucre scales. Other notable everlastings are *Athrixia tenella*, with small yellow fluffy flower-heads—a quaint-looking thing; *Helipterum roseum*, a very graceful plant, of which only the white-flowered variety was met with; the more modest *Helipterum strictum*, and though last, not least, that charming introduction, *Rhodanthe Manglesii*. This latter, as a rule pink-headed, though sometimes white, grows only in well-watered spots upon the granite rocks which outcrop in various places all through the interior of the colony.

Some of the West Australian Sundews are very pretty, and, the climbing ones especially, will doubtless in time be recognised ornaments of the conservatory. The handsomest seen by us were *Drosera macrantha*, with large snowy blossoms, and *Drosera Menziesii*, var. *flavescens*, with yellow. *Ionidium floribundum* is a lowly shrub with flowers, strikingly recalling a “counterfeit presentment” of those of the wild Pansy, only on a smaller scale. As a cultivated plant it could not for a moment be compared with its flaunting congeners; but it would be valuable to the gardener, if only because of the lavish way in which its flowers are produced. The reverse must be said of *Marianthus lineatus*, as its white and chocolate-striped flowers are larger than those of the cultivated *Marianthus cæruleo-punctatus* and *Drummondianus*, though some might prefer these latter on account of their extreme elegance. Malvaceæ are not abundant; the best from a horticultural point of view collected by us is the purple-flowered *Hibiscus Krichauffianus*; and among Sterculiaceæ the only one of much worth is *Keraudrenia integrifolia*. This bush, which one finds only close to granite rocks, has flowers like those of a *Rulingia* until

pollination occurs, whereupon the purple calyces enlarge to the size of a half-crown, and as they are borne in plenty, the plant at this time makes a handsome show.

Myrtaceæ are in strong force in the desert; indeed, in some parts they constitute the bulk of the flora. Species of *Thryptomene*, *Micro-myrtus*, *Verticordia*, &c., are not of much account to the horticulturist, but the magenta-flowered *Wehelia thryptomenoides* is more worthy of notice, and *Kunzea sericea*, with its large trusses of red or cream-coloured blossoms, needs only to be seen to be admired. Another well-represented order is that of the *Goodeniaceæ*; one of these, the well-known chaste little *Brunonia australis* is rather common here and there, as also are the yellow Mimulus-like flowers of *Goodenia mimuloides*, while you may see the blossoms of *Dampiera lavandulacea* in places on the granite, where water is apt to collect after rain. But the gem is undoubtedly a new *Velleia*, found on the bank of a creek in the far interior. This, with a fine disregard for convention, sports flowers of a lovely rose hue—a most rare occurrence in the order. Unfortunately, search how we might, we could find but one specimen of this, and that had not yet formed its capsule.

There are some pretty spinose *Solanums*, notably *Solanum lasiophyllum*, which you may find anywhere close to the granite outcrops, and a new species, allied to *Solanum orbiculatum*, with small round woolly leaves and purple flowers. Moreover this mention of *Solanaceæ* recalls a remarkable variety of *Nicotiana suaveolens*, assuredly the smallest of all the tobaccos, its stems sometimes only a couple of inches high, and the rosette leaves not even that length! We do not anticipate any ardent desire on the part of growers of the fragrant weed to raise a crop of this veritable tom-thumb of a plant.

Of course *Leguminosæ* are well to the fore, being represented by *Gompholobium*, *Gastrolobium*, *Phyllota* and other genera; most of them, however, have much similarity to species already cultivated. A notable exception is a new *Oxylobium*, a fine shrub reaching 6 feet in height, with large, deep-green leaves and long racemes of orange-coloured flowers. Neither are the *Acacias* of much account, as almost all the desert species have small inconspicuous spikes, though this cannot be said of *Acacia acuminata*, whose splendid phyllodes and inch-long blooms should gain for it unstinted welcome.

Eremophilas and *Pholidias* abound, and several new species of both genera—some of them deserving a horticulturist's notice—were brought down with us. Worthy of mention, too, is *Prostanthera Baxteri*, of which the flowers are pale lavender, or white streaked with purple; and, indeed, very like those of *Prostanthera nivea*, already an inmate of our conservatories. Another species, *Prostanthera Gryllana*, with dull-red flowers, would be of service to the nurseryman.

There is not much to be said about the *Proteaceæ*. Though they abound, the usual thing is for the flowers to be put forth but sparingly; but this is perhaps due rather to the prevalence of unfavourable conditions. There is, however, one charming *Grevillea*, a graceful shrub, 10 feet high, with cream-coloured flowers of cloyingly sweet scent. In deference to the authors of the botanical portion of the *Elder Expedition Report* we have called this *Grevillea nematophylla*, though it differs in some respects

from the Simon pure, an east Australian species. We have ventured to deal differently with a fine *Hakea*, called by the authorities above-named, *Hakea lorea*, but, in our opinion, so different from Robert Brown's plant as to leave no alternative but its description as a novelty.

Numerous species of *Trichinium* and *Ptilotus* serve to keep up the reputation of *Amaranthaceæ* as pre-eminently a desert-loving order. The finest of them is *Trichinium exaltatum*, introduced into cultivation long since. Without doubt, the prettiest of the unimported ones is *Trichinium Carlsoni*, which, in refreshing contrast with the eternal iteration of white or pink flowers indulged in by *Amaranth*s, bears heads now of an orange, now of a lemon-yellow colour.

As might be expected, orchids, so abundant in better-watered districts of the island-continent, stand at a high premium in the desert. Besides *Thelymitra* and *Pterostylis*, there are only two genera, *Diuris*, of which a few species are known in cultivation, and *Microtis*. The *Thelymitras* are the well-known blue *Thelymitra longifolia* and the yellow *Thelymitra antennifera*; the latter, unless we mistake, is not yet introduced. The *Pterostylis* is *Pterostylis pyramidalis*, a somewhat critical species, not likely to be warmly welcomed, inasmuch as it is so like others long familiar to the lover of plants.

From the above remarks the reader will probably gather that, at least from a botanical standpoint, the West Australian interior is not quite so poor as hasty inspection during the hot season might lead one to suppose. By no means, however, do we expect this article to result in setting the emissaries of our *Veitches*, and *Bulls*, and *Lindens* tumbling over one another in their eagerness to experience the delights of the desert, including, as such, a scorching sun, clouds of dust, and flies by the legion, with the chance of a wash in Heaven's good time! But there is one thing that might be done; any horticulturist happening to have a relative or acquaintance over there engaged in propitiating the fickle Goddess, might do worse than ask for a consignment of the seeds of any plant likely to strike the fancy. In this way, many a charming flower, now literally wasting its sweetness on the desert air, or, at best, looked on only by the careless miner or the naked — or, still worse — the semi-civilised savage, would have a chance of becoming a thing of beauty to a wider and more appreciative clientèle. *S. M.*

NEW OR NOTEWORTHY PLANTS.

LUDDEMANNIA SANDERIANA, Krzl., n. sp.*

A VIGOROUS-LOOKING plant, with strong ovoid, furrowed bulbs, and 3–4 leathery lanceolate leaves on each of them. In general habit it resembles

* *Luddemanna Sanderiana*, Krzl., n. sp. — Pseudo-bulbis magnis crassis obscure quadrangulis multicostatis tri-tetraphyllis, ad 10 cm. altis, 4–5 cm. diametro; foliis oblongis acutis ad 15 cm. longis, ad 5 cm. latis; scapo nutante v. pendulo pluri-multifloro; bracteis scariosis oblongo-lanceolatis acutis, 1.8 cm. longis ovarium nigro-fururaceum fere æquantibus; sepalis dorsali obovato-oblongo acuto, sepalis lateralibus basi paulum productis longioribus oblongis acutis; petalis cuneato-ovatis acutis, labelli lobis lateralibus oblique ellipticis fere orbicularibus erectis rotundatis, intermedio rotundato margine crenulato apiculato, toto disco velutino, callo elato a basi medio usque dense piloso; gyno: tamo sepalum dorsale fere æquante supra dilatato, rostellum productum acuminatum. Sepala alba v. pallide lutea, 1.8 cm. longa, 9 mm. lata, dorsale brevius, petala 1.5 cm. longa, ad 6 mm. lata; labello album; turpuro-striatum, et præsertim in callo purpureo-piloso, 1.2–1.5 cm. longum; gynostemium 1.2 cm. longum, album purpureo-punctulatum.

Colombia pr. Medellín, import. F. Sander, F. Kränzlin.

much that of *Luddemanna Lehmanni*, but it differs at first glance by the cream-coloured flowers and the lip, and to this part of the flower the most important characters of specific value are confined. The lip is also white, but with dense purple blotches and spots; the basal part especially is covered by a dense cushion-like hairy callosity of the darkest purple; the side-lobes are oblong, and the middle-lobe rounded. The spike hangs downwards, and bears about 20–25 flowers, and when just opened the appearance is very pretty. The colour turns after two days from creamy-white into a yellowish-mauve, and the purple into black. *P. Kränzlin.*

METHODS OF PROPAGATION.

(Continued from p. 85.)

PROPAGATION FROM EYES. — The India-rubbers, *Ficus elastica* and varieties, are readily increased from single eyes; but, unlike the Vines, had better have their buds started by heading back the shoots of the old plants set aside to propagate from. As soon as these buds have grown an inch or two, cut right through the parent-stem above and below the bud, and insert the piece carrying the started eye into a thumb (72) pot filled with sandy-soil, and when you have prepared sufficient for your purpose, plunge the whole up to their rims in a hot-bed of cocoa-refuse or tan in the inside lights of the propagating-pit, and after watering copiously, keep close for a week or so. Plants so raised make the best small specimens for all kinds of decorative work; and though the ordinary cutting-method is quick and good, yet it goes without saying, that if we have a scarce or rare plant to deal with, if one can make a saleable plant from every bud, it is better than sacrificing six to compass the same result. The variegated form of *Ficus elastica*, as well as the elegant *Ficus Hahnii*, and others of the genus, may all be thus propagated. I was set wondering how our American friends managed to work up such a large stock of any new Rose they send out in such a short time as they managed to do; and being of an enquiring mind in all matters relating to propagation, I soon gathered the following useful facts: — It is by using every single eye or bud, where possible, and rarely are two taken, where the wood used is fairly stout and ripe.

In the United States much of the propagation is done on benches or stages, which are heated from beneath by tanks, or hot-water or steam-pipes. These are covered with 4 to 5 inches of light soil, and the heat soon permeates this, and there is formed a bed in which all kinds of cuttings can be rapidly struck. But to return to the new Rose. When the temperature is regular throughout the bed, a pot-plant of the Rose is taken and cut up into pieces an inch or two long by diagonal incisions, each carrying a single bud or eye, with its leaf still attached to the node. The leaf may be shortened by removing the centre leaflet and the two next below it, when the eye or cutting is finished, and they may at once be dibbled into the hot-bed. In order to compass success in this process, the wood from which the eye has been cut must be of the current season, and have been grown under glass; to this end, propagators have always a batch of stock plants at their command, and then the only other proviso is that the plant from which it has been cut is in vigorous health, neither attacked by mildew, or rust, nor any insect-pest. Thus treated they root quickly, and as soon as they have made a little top-growth, they may be taken out of the soil in which they were struck and potted into single pots, being very careful not to bruise the young and tender wood in the process, or it will turn black and die. Shade for a time, say till the young rootlets appear at the side of the pots, when it may be dispensed with, except just in the middle of the day; but Roses are very apt to scorch. Plants raised thus, especially of the Tea and Noisette section, are the very best for pot work, for forcing, and for planting-out in span-pits, to grow for cut-flowers.

The plants of the new Roses received from the growers in May and June, are, as a rule, in just the

condition to furnish single eyes for this purpose, but it is waste of time to attempt to propagate Roses thus, when from any cause they have lost their foliage. In gardens or nurseries there are no means of extemporising a bench such as have indicated, the best substitute for it is a deal box about 6 inches deep, filled with soil, and plunged in fermenting dung or tan. The Rose may be then dibbled into this, and with careful attention to temperature, moisture, and shade, will be satisfactory, if not entirely successful.

Besides Vines for fruiting purposes, any tribe can be raised from single eyes, such as the leafed or Parsley, and the purple-leaved Grape, any of the Virginian Vines (*Ampelopsis*) can be multiplied; and that reminds me that the useful and deservedly popular *Ampelopsis Veitchii*, from started eyes, can thus be propagated indefinitely. Take an old well-branched plant of this useful and plant it out in a warm propagating-house, or in a Melon or Cucumber-pit, and as soon as it has growth, which it will from nearly every bud, allow them to grow from 4 to 6 inches long, and remove them with a sharp knife close to the old stem, and dibble them into the soil of your hot-bed, or in a cold frame, and shade for a while, and in a very time each piece will root, and may have a short put to it, or be lifted with a little ball of earth, be potted into a small 60-size pot, being careful not to break or disturb the tender root-fibres. Hardly, and then plunge out-of-doors under a glass, or hedge, and if large plants are desired, and stake with a longer stake each time they are shifted.

Thus much for single eye propagating, but I wish to suggest that I have exhausted the subject. *Experience.*

(To be continued.)

MR. HARRISON WEIR'S GARDEN.

As the traveller speeds through the station at Epsom, on the South-eastern Railway, he can fail to be attracted by the geological section which railway makers have exposed to view on either side a little distance from the platform. The railway cuts across a noble mould of greensand, and on one side an arch is formed of huge blocks of sandstone, pieced together as the stones of a bridge, and with beds of sand between the layers of rock. On the one side of the rail is the garden of Mr. Barri Crawshaw, all aglow when we saw it with oriental Poppies, and rich in selected flowers of *Odontoglossum crispum*. On the other side, as we are going down the line, is the residence of an old friend and valued correspondent, Mr. Harrison Weir. It is not for us, in his presence as it were, to dilate upon the service his artistic pencil has rendered for so many years to humanity. To our readers will be specially known not only as an artist, a naturalist and a gardener. Knowledge of his work begets a desire to see his garden, and his work begets a desire to see his garden is so often an index of a man's tastes if his character. It is almost needless to say Mr. Weir's garden is unconventional. It would drive a soil-scraping, root-denuding, verge-cutting gardener to despair. Flower-beds and herbaceous borders in the narrow technical sense there are none, and the whole garden is one vast floral spectrum. There may be some soil somewhere, in fact we are sure there is, but it is not visible, so thickly is it covered with motley flowers and diverse foliage. So there must be a plan, and a one skilfully carried out, but it is not apparent till one looks for it. The garden in fact occupies part of the slope of the hill, and mound we spoke of. It descends sharply from the house at the top of the bank to a terrace looking the rail, and from which a fine view of the Kentish downs is obtained. Narrow paths lead from terrace to terrace, amid a wild of gay flowers, tall perennials and lowly and bushy shrubs, and aspiring trees.

Mr. Weir is, as we have said, an enthusiast

plants—he finds beauty in all and each—so would not be practicable even if it were desirable to enumerate his treasures. Moreover, so many and diversified are they that the aspect of one week is notably different from that of another. Take the year through, never will there be a day in a garden like this where some cannot be found to admire and instruct. What the weeds! some one will say. Well, there are some—and there are none—a paradox that is solved by the fact that, while care is taken that shall be obtrusive, or occupy space where they are not wanted, others are left to grow at their own will, or at least with as great freedom as the place allows for existence in so densely peopled a garden. The Foxglove is one of the local weeds, and is duly cherished. It is a lesson in taste and civility to hear the proprietor descant upon the form and colour of some of these too often

stop. Our readers will feel that reticence in this particular will give a juster notion of an artist's garden than any cut and dried enumeration of sesquipedalian names could do.

THE WILD APRICOT AND THE GRAFT.

THE culture of the Apricot has been traced as far back, in the history of nations, as the Assyrian period, and at least two Latin authors, Pliny and Columella, refer to the tree as a variety of the Plum, and as a native of Armenia [and the former states that it had been introduced into Italy about thirty years. Ed.]. As regards its origin, modern researches have shown that the Apricot does not grow wild either in Armenia or in the Caucasus; and, according to Reynier, the stretch of African territory extending from the river Niger to the Atlas range of

grafted themselves thrive therein, and the necessary amount of heat is also available. In its native country, and in Central Asia, the natives propagate the Apricot by seed. True reproduction is, however, only obtained by means of the graft, and to this end the Peach-tree is generally used as the subject in the region of the Vine, where the Almond-tree is, however, preferred in calcareous or dry soil. In more northern latitudes, as in Central Europe, and in irrigated or damp ground with a good subsoil, the stock generally adopted is that of certain varieties of the Plum-tree, such as Myrobalan St. Julien or Damascus.

At the last (and first) Pomological Congress which, not long ago, was held at St. Petersburg, a well-known Russian horticulturist, M. Simirenko, drew attention to the value of the wild Apricot for grafting cultivated varieties of the Apricot itself, as well as those of the Plum and Peach trees. He gave it as

FIG. 39.—VIEW IN MR. HARRISON WEIR'S GARDEN AT SEVENOAKS. (SEE P. 138.)

ed plants. So great is the elegance in the form and foliage of many of them that it is a pity they are more often suffered to remain where they are, than to be removed to other parts of the garden, where they would add to the general charm by the varied form and colour of their leaves, and inflict little or no injury on the plants they associate. A little attention in the way of digging before the seeds are ripened will prevent their undue multiplication, whilst a similar attention to their subterranean reproduction is afforded by the number and variety of the competitors. If the seeds are not sufficient to keep the unruly in check, they may be turned in, but with the precaution of not allowing them to become the greatest part of the whole.

On the high ground are flowering shrubs in profusion, and a selection of ornamental and "picture" plants, whilst Mr. Weir's pomological inclination is shown in the representation elsewhere, as also do the various other things which he writes so pleasantly. Reading this note over, we find that he has mentioned a single plant by name, and so, we should not have known

mountains, is to be regarded as its original habitat. The introduction of the Apricot into Europe is apparently due to the Romans, at first into Italy, then into Greece, and subsequently and gradually throughout the central European region.

Considering its southern origin, a considerable amount of heat is naturally required for the complete maturation of the fruit, and hence it is that, under ordinary conditions, the Apricot grown in, say, the south of France, is much superior in flavour to that obtained in the open air in more northern latitudes. The tree, moreover, enters into development at an

early date, because of the damage that considerable results which are caused by the disease, as

his opinion, based on the results of many years' experience, that *Armeniaca vulgaris* is the most valuable subject in this connection, inasmuch as it shows no antipathy to any variety of the above-mentioned fruit trees, which develop vigorously and luxuriantly thereon. The wild Apricot is, moreover, remarkable for its powers of endurance, and in the province of Kieff, where the winter is very severe, the tree has never been known to be injuriously affected by frost, an advantage which the other ordinary subjects do not possess. Early in the spring of each year M. Simirenko grafts indoors some thousands of Plum trees on the wild Apricot, of which plants are preferred, for the Apricot and Peach, which are at least a year old. If the graft is unsuccessful, the subject is cut low down in the autumn, so as to make use of the shoot which is thereby subsequently developed. M. Simirenko obtains his supply of wild plants by seeds sown in the autumn, and young plants are obtained very regularly if the trees are not too crowded.

regards the Plum tree, which demands a

moist soil, Hungarian varieties in particular, the wild Apricot is of particular advantage, inasmuch as it thrives well on dry land, and irrigation or watering is consequently less necessary. The roots of the wild Apricot, moreover, do not encumber the soil, and because the shoots remain full of sap until late in the season, the rind is easily detachable in the autumn, so that the process of grafting [budding. Ed.] can be delayed beyond the busy summer. As regards resistance to low temperatures, M. Simirenko states, as has indeed been also observed in America and in Germany, that P. St. Julien is the most susceptible to frost, and that trees grafted on P. Myrobalan are not very long lived. The President of the French Pomological Society, who has recently referred to this subject in the *Pomologie Française*, testifies to the same effect, the average duration of Apricots so grafted in the Ain department, for instance, not exceeding four years. Nor does the cause appear to have been hitherto explained; the Apricot almost invariably grafted on the Plum in France, grows at first very vigorously, the scion dies, though the subject (stock) continues to thrive. It is, therefore, suggested, as was, indeed, proposed by M. Carrière many years ago, that *Armeniaca vulgaris* might be adopted in this connection with considerable advantage in France, not only in the warmer districts, but also in the more northern region, where the Apricot does not naturally grow to perfection.

The wild Apricot is widely employed for grafting purposes in the Crimea, especially so in Bessarabia, and the Germans are now importing large quantities of young plants of this kind from Russia. It is also interesting to note, in conclusion, that many native tribes of the African region which, as I have already stated, is the native habitat of the Apricot, are sufficiently good horticulturists to know the value of the wild variety for purposes of grafting. *Scion*.

THE DISEASES OF PLANTS.

(Continued from p. 118.)

Treatment of Seed for Fungi.—Seed mixed with fungus-spores is the source of not a few diseases of crops. The winter spores of most fungi are adapted to lie dormant for long periods, and, as most of them ripen along with the plants inhabited by the parent fungus, they readily find their way into seed. This is particularly the case with the diseases known as smuts and bunts, but also happens with rusts, mildews, and other fungi. The spores germinate along with the seed, and the fungus readily makes its way into the young seedling plants. In fact, certain diseases, e.g., smuts and bunts can only attack their host-plants in the seedling stage, and that they do so successfully is proved by the number of black-smutted ears one sees in almost every field of Oats or Barley. Other smuts are common and injurious on Onion, Beet, Carnation, and Violet, also on wild plants such as Thistles, Anemones, Primulas, Hyacinths, and their allied cultivated forms. In every case the smut starts from the winter spore, and enters the young plants; at first, and for a long time, there is no external indication of disease, the fungus keeping out of sight, but in pace with the growth of the plant. The smut does not appear till the flowers are formed (sometimes it may be in the foliage), then it breaks out as pustules which shed a dark powder, the new crop of spores ready to be carried by wind, rain, insects, &c. to new plants, or to lie dormant till a fitting opportunity for germination presents itself. The concealment of the early growth of smut-fungi in their host-plant renders fruitless any attempt to reach them by fungicides. By the time spores appear there can be no cure, the crop is beyond recovery. Measures against smut-fungi must therefore be directed at killing the spores to prevent access of the fungus to crops liable to suffer. Hence the

necessity of treating seed in some way which will not harm it, but will kill the spores of fungi, as well as others. The more important methods of doing this are as follows:—

Sterilisation by hot water, or Jensen's method (see *Journal of the Royal Agricultural Society*, 1888, p. 397).—The object of this process is to subject the seed for a short time to the action of water hot enough to kill adhering fungus-spores, but not to injure the seed. This takes place with grain after five to fifteen minutes in water, about 130° to 134° Fahr.; with Beet-seed, after five minutes. The immersion is carried out by placing the seed in a vessel easily permeable by water; for example, a basket lined with coarse canvas. The hot water is best contained in two large vessels, the first with warm water, to wet the seed, and to prevent cooling of the water in the second vessel or boiler, which must be kept constantly between 130° and 134° Fahr.; a lower temperature will not ensure death of the spores, a higher may injure the seed. After a few minutes' immersion in the first boiler, the seed is placed in the second for at least five minutes, and frequently stirred. With dry seeds like Beet, it is recommended to soak them first in water for a few hours, and allow to stand till swollen; grain, however, does not require this. The seed after hot-water treatment is cooled in cold water, and spread out till dry enough to sow.

Sterilisation by Copper-sulphate.—The steeping mixture is a half per cent. solution of copper-sulphate in water, prepared by dissolving 1 lb. crushed commercial sulphate of copper (bluestone) in hot water, then adding it to 22 gallons of water. The seed is allowed to stand covered by this solution for a night, from twelve to sixteen hours; then take out and allow to drip till dry enough for sowing. The method may be improved on, if, without removing the seed, the copper liquor is run off, and the seed covered with milk-of-lime, prepared by shaking up 1 lb. of good fresh-slaked lime in each 4 gallons of water used; after stirring for five minutes, the lime liquor is run off and the grain spread out to dry.

Sterilisation by Potassium-sulphide.—The seed is left twenty-four hours in a half per cent. solution, prepared by dissolving 1 lb. of fused potassium-sulphide in 24 gallons of water. The seed is placed in a wooden vessel, covered with the solution, well mixed several times during the twenty-four hours steeping period, then spread out to dry for sowing. The powder advertised as "Ceres-powder" contains potassium-sulphide with other ingredients. It has been recommended for grain-smuts.

The success of these methods depends greatly on their general use throughout a whole district, and year after year. In addition to using steeping-mixtures, every precaution should be employed to destroy diseased plants, particularly in the case of smuts on garden or vegetable produce. It is believed that the use of fresh farmyard-manure containing smutted straw should be avoided, and that well-rotted manure is much safer.

Treatment of Rusts.—The rusts, or Uredineæ, as they are scientifically called, are amongst the commonest pests of cultivated crops, their rusty or brown colouring rendering them easily distinguishable amongst the green foliage. The remedy to keep them out of the garden has, however, yet to be discovered. No treatment we know of can be applied against them with much chance of success. We can only recom-

mend that plants likely to be attacked be cultivated in as healthy surroundings as possible, and that rust-proof varieties be selected for use. The ravages of the Hollyhock-rust are a case in point, no remedy ever seemed to affect it; and now we are only taking up this valuable decorative plant again after it had almost disappeared. The Carnation-rust threatens us now, and as yet the only remedy seems to be the drastic one of rooting-out and burning all infested plants. The agriculturist seems no better off with rust on Wheat. It is, therefore, to be sincerely hoped that those with opportunity of experimenting with Carnation, Plum, or other rust could get some reliable method of treating this annoying group of fungi. Bordeaux Mixture or potassium-sulphide has been recommended for various rusts, but results hardly justify the expense and labour of application. Where these fungicides are already in use they may check rusts, and it would be well to observe the results. The problem of combating rusts is complicated by the fact that many of them pass part of their existence on one host-plant, part on another. Thus, Wheat-rust inhabits at one time Wheat and many grasses, at another Barberry; a common Apple-tree-rust has a second stage on Juniper, and Pea-rust has a stage on Euphorbia. We cannot, however, say definitely whether the rust may not exist on one host-plant without the other; this is said to be the case with Wheat-rust. *William G. Smith, Edinburgh.*

(To be continued.)

CALCEOLARIA ALBA.

ONE of the most attractive exhibits at a recent meeting of the Royal Horticultural Society was constituted by some well-grown plants of this species shown by Mr. J. T. Bennett-Poë. The foliage is rather dense, the linear leaves being almost whorled, and the inflorescence terminal, much branched and many flowered. Each flower is snow white, or the white of the ripe Snowberry (*Symphoricarpos*). The plant is hardy in favourable localities, and is of a very decorative character, whether grown as a pot plant in a greenhouse or in beds. It is rarely seen now-a-days, though it was introduced from Chile to the Veitchian Nursery at Exeter, by William Lobb, so long ago as 1844. A coloured figure was given in the *Bot. Mag.*, t. 4157.

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 63 to 69.)

5, SOUTHERN COUNTIES.

(Continued from p. 122.)

BERKSHIRE.—I have scrutinised the crops more extensively this season than last. It has been a peculiar season; and, in regard to Apples, many of the trees, and even orchards, have about one-third of a crop. Two trees of the same variety will be growing side by side; one is bearing abundantly, and the other has none. Pears are mostly good upon wall-trees, and fair on standard-trees. Plums may be considered a general failure in this district, the early frosts having ruined the blooms, as they did those of the Cherry, and almost killing the small branches upon my trees. To finish off my survey, on the 20th ult. I visited the beautiful grounds and gardens of C. E. Keyser, Esq., Aldermaston Court, where Mr. Galt has been working out great improvements of late years. In regard to fruit there, the features are exactly as I have stated in the table. At the other extreme of my visiting Englefield House, the fine seat of R. Benyon, Esq., Mr. Coombes can boast of the best crop of Peaches, Plums, and Apricots, on the walls that I have seen. As a whole, this year's crops are the worst I have known for twenty-one years. *Robert Fenn, Sulhamstead.*

— Apples are the worst crop for many years, the depending upon a few never-failing varieties of the in class, viz., Keswick Codlin, Frogmore Prolific, King Castle, and Potts' Seedling; late-keeping ones will be very scarce indeed. The Pear trees good crops on walls, but with a few exceptions are a failure on trees in the open. Plums are scarce on walls as on orchard trees. Cherries, sweet and Morello, are an average crop on wall-

appointing, Plums more especially; for although these bloomed well, they failed to set, which may, I think, be partially attributed to the harsh winds and frosts prevailing whilst the trees were in bloom, and partially to the fact that owing to the wet, almost sunless autumn, the wood failed to ripen satisfactorily. To the part failure of the Apple crop this applies, I think, with still greater force. *W. Pope, Highclere Castle Gardens, Newbury.*

poorer crop, Glou. Morceau, Knight's Monarch, Thompson's, Beurré Rance, Beurré Diel, Seckle, Madame Treve being the only ones which are fairly cropped; and a few are to be found on trees of Marie Louise. Catillac has a good crop. The Plum crop is the worst we have had for some years, there were 10° of frost when the trees were in flower. The same cause ruined the Cherries. Figs on outside walls are a very good crop. Gooseberries, red and white Currants, and Strawberries were capital, and of the last, Royal Sovereign and Laxton's Latest-of-All, were very fine and good. *T. Denny, Down House Gardens, Blandford.*

HANTS.—The Apple crop, as a whole, is not an average crop; while such varieties as Mère de Ménage, Irish Peach, Worcester Pearmain, King of the Pippins, Lord Suffield, Warner's King, Cox's Orange Pippin, in one orchard are heavily laden, the same varieties, not 200 yards distant, are a failure. Caterpillars have not been so troublesome as in some past years. The crop of Plums on the wall trees is a fair one. Strawberries were good, but the season was short, Royal Sovereign being especially fine and good. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

— The fruit crops in this district, taken as a whole, are under average, which I attribute mainly to the cold winds in the early spring, as the first indications were most favourable. Apples in general are much below the average, but there are individual exceptions; and the same holds good for the Pear crop. Plums are a failure. *J. Wasley, Sherfield Manor Gardens, Basingstoke.*

— Fruit here, on the whole, is very scarce, owing mostly to the late frosts in May, and the heavy rains when the Plums and Damsons were in bloom. Peaches and Nectarines have not set quite so well as usual. Blister has been very bad with me; all the first leaves had to be taken off, which gave the trees a severe check. I gathered the first Peaches (Waterloo) from open wall on July 10. The trees now are making good and clean growth. *Arthur Lee, Palace House Gardens, Beaulieu, Southampton.*

— The Apple trees are clean and healthy, but the fruit has dropped very badly, owing to the heat and drought. We have plenty of Pears, and the trees also have a healthy appearance; but the fruits, like those of the Apple, have dropped very much from standards, but not from trees on walls. Plums are a fair crop on wall trees in sheltered places. Gooseberries are hereabouts a thin crop, as are Raspberries, and the fruits are small for lack of moisture in the soil. The Damson trees carry a very heavy crop, and the trees are clean and healthy. *W. Smythe, Basing Park Gardens, Alton.*

— Although there was great promise of an abundant fruit harvest, we can scarcely term it an average one. Apples and Pears bloomed freely, but defective fertilisation caused most of the bloom to fall; in many instances the trees are quite barren. King of the Pippins, Deux Ans, Lane's Prince Albert, Cox's Pomona, Cellini, Barnack Beauty, and a few others are laden; whilst, of Pears, Marie Louise, Pitmaston Duchess, and Beurré Hardy, are amongst the best. Small fruits have been up to the average. Peaches and Nectarines outdoors are good, and trees healthy and clean. *A. Maxim, Heckfield Place Gardens.*

KENT.—During upwards of twenty years that I have been here, I do not remember having such bad crops of Apples, Pears, and Peaches as we have this year. All varieties bloomed well, and set fruit very thickly, but owing chiefly to continued cold east winds, and a few slight frosts when the fruits were about the size of Peas, they, in most cases, all ran off. Another effect of the cold was to be seen in the abundance of blister, which at one time seemed almost impossible to eradicate, but by continually pinching the diseased leaves off, they have made good wood since the weather has been more genial. Cherries have been as near a total failure as possible. Whereas the orchards on one farm near here were sold last year by auction for £1300, this year the highest bid was

FIG. 40.—CALCEOLARIA ALBA. (SEE P. 140).

but they are quite a failure on orchard standards, and Nectarine trees suffered much from the weather in the spring, and there are scarcely any sets. Small fruits were good, particularly black ants and Strawberries. Walnuts generally are failure. *T. Turton, Maiden Erlegh Gardens, Woking.*

— Fruit crops this year are, on the whole, dis-

DORSET.—Considering the wealth of blossom which showed on the Apple-trees, a good crop might have been anticipated; but, as a fact, few varieties have any. Striped Beefing, Irish Peach, and Yorkshire Greening are well cropped; whilst King of the Pippins, Keswick Codling, Beauty of Kent, Gravenstein, Lord Suffield, Duke of Devonshire, and Ribston Pippin have moderate crops. Pears are a still

£200. On the other hand, small fruits have been very plentiful, especially Strawberries and Gooseberries; but owing to the drought, the former fruit was soon over. Plums and Damsons are generally a very thin crop, although, where they have been washed to destroy the vermin that would eventually get on to the Hops, fairly good crops are to be found. Apples in some orchards are well cropped, especially the Codlin type. Kentish Cob-nuts abundant, and where washing was resorted to against the caterpillar, there are immense crops. *Geo. Woodward, Barham Court Gardens, Maidstone.*

— The fruit crops suffered very much from May frosts about the 12th, 13th, and 14th; on the 13th we had 5° of frost, which spoilt the best blooms of early Strawberries; the later varieties, however, have been very good. Other fruits dropped from the trees, viz., Apricots, Peaches, Plums, and Cherries. Some Apples are a good heavy crop, such as Blenheim Orange, Tower of Glamis, Stirling Castle, Duchess of Oldenburg, and King of Pippins; but, as a rule, the crop in this neighbourhood is poor. X.

— The fruit-crop in this district is one of the lightest we have seen for years. Cherries were nearly a total failure, and even the few there were were of poor quality. Pears are almost as bad. Apples are patchy. Taken as a whole, there is not half a crop; the quality, however, promises to be first-class. Strawberries have been a large crop of indifferent quality. Cob-nuts and Filberts so far are a record crop. If nothing goes amiss with them, they will be quite twice an ordinary yield. *Champion Bros., Borough and Covent Garden Markets, and Mereworth, Maidstone.*

— Apples, Pears and Plums are decidedly the poorest crop and quality of my eight years' acquaintance in the locality. It is partly due to spring frosts, but I think more so to last year's drought; as the bloom was small and extremely abundant. Aphis has been abundant on Apples. Out of several hundreds of varieties of the three fruits above-mentioned, there is not ten per cent. with fruit on. *Geo. Abbey, Junr., Avery Hill, Eltham, Kent.*

— All fruits blossomed well, but the continued E. and N.E. winds, with low night temperature, checked growth, and most of the fruits fell off. Locally there are a few Victoria Plums, but in this district there is no good crop except Cob-nuts and Filberts, which are the largest known, and the bunches are the biggest. *George Bunyard, Royal Nurseries, Maidstone.*

— Strawberries cropped heavily, and the fruits were of capital size and flavour. Peaches and Nectarines were fair, but the blister and continuous cold nights early in the season lessened the crop of fruits. Apricots, Morello Cherries, and Plums poor. Several of the free-bearing varieties of Apples and Pears are well cropped, and required thinning, but on the whole the crop is far from being a plentiful one. *H. Markham, Northdown, Margate.*

— The cold and perishing east winds in spring, in addition to severe frost in May, destroyed a most promising and abundant crop of Apples, Peaches, Apricots, and Plums. Strawberries have been a heavy crop of fine fruit, also Gooseberries, black and red Currants. Filberts, Cob and Walnuts are plentiful. *Geo. Hutt, Lullingstone Castle, Dartford.*

— In early spring fruit trees generally were looking very promising, and there was a fine show of blossom, but owing to the late frosts the crops will be anything but satisfactory. The hailstorm on June 6 did considerable damage in the immediate neighbourhood. *F. Moore, Blendon Park, Betchley.*

— All kinds of fruit trees blossomed abundantly, but there is only an average crop of Apples, owing to the cold north-east wind which was blowing during the time the flowers were expanded. Pears are a splendid crop on the walls and upon standards. Plums are good. All bush-fruits have been heavy crops, but individually small. Strawberries were good, but the season short. I have never seen such a crop of Nuts. *A. Wilson, Eridge Castle Gardens, Tunbridge Wells.*

(To be continued.)

AMERICAN NOTES.

PLUMS.

SEVERAL weeks ago attention was called in these columns to the marked tendency to include in American fruit-lists more and more varieties of native origin, and fewer and fewer of foreign birth. The course of events is especially interesting in the case of the Plums, in which the representatives of several species are competing for favour. Several varieties of Japanese Plums have been widely disseminated in quite recent years; but even now many of the best varieties of this class are American seedlings from the Japanese importations, as Hale, and Juicy. America is blessed, however, with several vigorous species of Plums, the potential good qualities of which are only beginning to be realised. The varieties introduced to cultivation have been mostly derived from *Prunus americana*, *P. angustifolia* (chicasa), and from the multifarious natural hybrids commonly passing under the name of *P. hortulana*. This last group, represented best by the well-known Wildgoose, has been peculiarly prolific of fine garden varieties, such as Whitaker, Milton, Miner, and Moreman. Meanwhile, introductions are made from *Prunus Watsoni*, a dwarf species from the Kansas sand plains; from *P. maritima*, the beach Plum; from *P. subcordata*, the Pacific coast Plum; while *P. rivularis*, *P. gracilis*, *P. grandulosa*, and other native species are being manipulated by many experienced plant-breeders, who permit us to be surprised at nothing in the way of strange results. Many strange and interesting hybrids have already been produced, and it seems altogether probable that the genealogies in our Plum-list will become rapidly complicated in the future.

The effect of these diverse introductions on the garden culture of Plums is decidedly good. It adds an interest to Plum-study which is of itself an object, aside from the production of fruit. It furnishes varieties adapted to all tastes, all soils, all climates, and all sites in a country where many diverse conditions are diversely severe. And we may still hope that the best results are yet to come.

American Dwarf Cherries.—In connection with the American Plums, the native dwarf Cherries ought also to be mentioned. Several varieties have been urged in the nurserymen's catalogues in recent years, and have enjoyed extensive experimental planting. Most of the named varieties have been seedlings of *Prunus Besseyi*, although the Utah hybrid is believed to be a cross between that species and *P. Watsoni*; and *P. pumila* has not been forgotten by the experimenters. But no variety yet introduced has shown any possibilities as a dessert-fruit, and the culinary value of some is still doubtful. Moreover, they are specially liable to disastrous attacks of the brown-rot fungus, which renders fruitage very uncertain.

"Principles of Fruit-growing."—Professor Bailey has issued another book. There is nothing unusual in this, nor yet in the fact that it is a good book. We have learned to expect one or two books a year from Professor Bailey besides his bulletins and other contributions to horticulture and botany. *The Principles of Fruit-growing* are here set down pretty much as the author teaches them to his students, and the volume is therefore something of a students' textbook. There is, however, nothing juvenile in its tone, or in the treatment of the topics, but such a statement of scientific principles and practical empiricisms as seems likely to interest and assist the unlettered grower of Grapes or Pears. While this volume has little or none of the scientific value of *Survival of the Unlike*, it is quite probable that it will find much wider circulation and more general appreciation among practical horticulturists.

Testing Varieties.—Anent the recent discussion of work for Chiswick Gardens, I note the emphasis laid on the comparative tests of varieties of fruits, vegetables, and flowers. This is a subject which has been very thoroughly threshed over in experiment stations circles in this country. In general, experience tends to discredit this class of work. There are a few places in America where varieties of certain groups are tested with ample results of value. The extensive fruit tests carried on by Mr. Beach at Geneva, N.Y., and by Mr. Craig at Ottawa, Ont., have been of great and undeniable good to planters; but the variety-testing, which has been a very large part in the scheme of horticultural work at many experiment stations has been an almost absolute waste of money. Those experiments which elucidate general principles of horticultural and agricultural practice seem to give the

most for the money spent. The magnificent done in spraying, and the control of plant well illustrates this. The extensive studies have been made at several stations upon hort and botanical classification have also helped our pomology and olericulture upon a scientific reasonable basis, and thus to give us so advancement with the world. *F. A. Waugh.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Leic.

Figs.—The early house has probably finishing the second crop of fruits, and the treesh should be relieved of any small fruits remaining, the house be thrown wide open if the trees are pl borders, removing the lights if possible, so sure the wood being thoroughly ripened, and rested. If in pots or tubs, they should be to a sunny position out-of-doors, taking care not suffer from drought at the roots. If plunge the pots in some old leaves, and sh weather become very wet, slates or boards placed over the pots, to prevent the soil sodden through too much water. These apply to all orchard-house trees in pots t been moved out-of-doors. In later houses t will still be ripening. Ripening Figs ar injured by damp, therefore damp the h frequently; and if the weather be wet, caus heat to pass through the pipes, accom the circulation of a little air. Let the fr till thoroughly ripe, and should they ripen and it becomes absolutely necessary to gath they will keep longest on an inverted air-sie out any leaves, so that the air can circula amongst them. If the trees in the inter house are being pushed on to ripen the seed they will now be swelling up fast, and a given liberal supplies of warm manure-wate well syringed once a day, when the house which should be done early.

Pines.—If any Pines have to be repotted, should be taken in hand at once, and the arranged for the season. Take care to g sufficient root-room to carry the plants thr winter without becoming pot-bound; and v doubts exist as to the pots being large e enable them to do this, they should be s once, for if they get pot-bound, and a in that state, they will be sure to throw fruit prematurely, and thereby cause a seri in the succession. If the stock of plants is good strong suckers are available, the pre good time to put in a batch, as they will g rooted, and make good strong plants by s any are carrying ripe fruits, and the room i lift them out and place them in a cool vine; they will keep in good condition for some ti

THE FLOWER GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Mal.

Bedding Arrangements.—The plants in th flower-beds being now at their best, it will look over them with a view to deciding how the arrangements are worth repeating ano It is necessary that the requirements for should be estimated now to enable the prop sufficient plants of a certain variety, and t any waste of time over plants that eventua not be used. The hot weather has favoured jects as Pelargoniums, Zinnias, Petunias, and num. Verbenas are also gay, while Calceo Begonias, where circumstances have not the application of water *ad libitum*, are instances suffering badly. One of the sim prettiest mixtures here this season in a pa consists of the old variegated Pelargonium and the dark blue Viola, Archie Grant. T were planted out early in spring, and thoroughly established before summer set Pelargoniums being dotted over the bed la latter are allowed to retain their small flowers, and both subjects are blooming although little water has been applied; Violas have not been allowed to seed.

Chrysanthemums in beds and borders will n at the roots to preserve the foliage in a s condition. The early-flowering Madame C. I G. Wernig, and similar varieties in beds, given an occasional soaking of liquid manure

Erythrina crista-galli.—The present beauty of this half-hardy herbaceous plant suggests a note in reference to its adaptability for the borders in a position where the roots may be slightly protected during the winter if needed. Any sheltered spot, such as afforded near the base of a south wall, for preference that of a stove or greenhouse, will answer admirably. When planted in such a position in southern counties, very little protection is needed for the stools, except in severe winters, when a covering of bracken, coal-ashes, or cocoa-fibre is necessary. A large specimen in these gardens has been so treated for many years, and annually forms a most interesting feature. Many of the growths on this old-established specimen attain to a height of 7 feet, the upper half being well covered with their handsome coral-red blossoms. The principal requirements towards free growth are perfect drainage, with a fair depth of good loamy soil. Propagation may be carried out by dividing the crowns in the spring when just starting into growth, or from seeds, which may be sown at the present time, in pans containing light soil. Place them in a close frame, and grow them on in a warm house through the winter, for planting out next summer.

General Work.—Should the present showery weather continue, prick off Wallflowers, *Myosotis*, and other spring bedding plants. Divide and transplant *Heuchera sanguinea*, *Hesperis matronalis albus plenius*, *Verbascum Chalcidii*, and such plants that have flowered and are possible of increase by division.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Barford, Dorking.

Dendrobiums.—Some of the deciduous and semi-deciduous *Dendrobiums* are about completing their growth. When the new bulbs are quite made up, it will be necessary to remove the plants to a cooler and drier atmosphere, and full sunshine. This change, however, should be effected gradually, because, just when the bulbs are finishing many of the old roots are growing, and emitting lateral rootlets. It is principally through them that the plants gain sufficient strength to flower. When the terminal leaf at the extremity of the bulb is complete, select a position at one end of the growing-house, and place there such plants as are in this condition, and for a week or ten days expose them to more light and air, and at the same time gradually lessen the amount of water at the root. After this time the plants may be taken to a cool greenhouse or vinery from which the Grapes have just been gathered, taking care to place them out of the line of draughts. The vinery is perhaps the best place for them, as there the plants gradually pass from moderate shade into full sunshine. When thus exposed, the leaves soon turn yellow, and if allowed to remain untouched, they will in time fall away naturally. The water given the plants at the roots should be reduced by degrees until after the leaves have fallen. In watering plants at such a stage, the inexperienced should not depend entirely upon the appearance of the compost, because, being exposed to strong sunshine, the surface of the soil quickly becomes crisp and dry, while underneath the roots may be saturated. A sound practice is to carefully examine the plants every day, and immediately the newly-made bulbs show the least signs of shrivelling, then give the plants a thorough watering. It seldom happens that all of the plants are ready for removal at the same time, therefore, when the earliest are taken out, others will be ready to take their place. Such practice enables the grower to gradually mature his plants, and they will be less liable to injury when exposed to full sunshine in the resting-house. Up to the present we have removed the earliest of the following well-known varieties:—*D. Wardianum*, *D. crassinode*, *D. nobile*, *D. Ainsworthii* × *D. splendensimum grandiflorum* × *D. crystallinum*, *D. lituiflorum*, *D. Pierardi*, *D. aspasia* × *D. Juno* × *D. Domini* × *D. Linavianum*, *D. eucosmum leucopteryum* × *D. Cassiope* ×, and several of the melanodiscus and chrysodiscus hybrids. There are still many plants of the deciduous section that are in the middle of their growing season, as *D. anosmum*, *D. Parishii*, *D. superbum* (macrophyllum), *D. albo-sanguineum*, *D. primulinum*, *D. Boxallii*, *D. cretaceum*, *D. crepidatum*, *D. tortile*, *D. Hildebrandtii*, &c. These must be given liberal treatment both at the root and in the atmosphere, until growth is completed. The same remarks apply also to the taller-growing species, as *D. Dalhousieanum*, *D. moschatum*, *D. binoculare*, *D. fimbriatum*, *D. Paxtonii*, *D. calceolus*, and *D. clavatum*. Some of the evergreen section, as *D. thyrsoiflorum*, *D. densiflorum*, *D. Schroderae*, *D. Farmeri*, *D. Guibertianum*, *D. Grif-*

fithianum, *D. suavisimum*, and *D. chrysotoxum* have made their growth, but it is not advisable to remove them just yet. Like *D. Wardianum*, these plants are liable to start secondary growths; but, if possible, they should be prevented from doing so, as one set of growths each year is all that is necessary to the well-being of the plant. In order to prevent its occurrence, place the plants, immediately the growths are made and the leaves fully expanded, into a warm, light position in the Cattleya-house. Water the plants with discretion, or the foliage will become spotted and unsightly. When the growths are matured and the leaves have attained their proper green colour, then the plants may be removed to a somewhat lower and drier atmosphere. Such distinct species as *D. Dearei*, *D. sanguinolentum*, *D. Huttoni*, *D. subclausum*, *D. glomeratum*, *D. triadenium*, and *D. O'Brienianum* are still making their growths, and appear to thrive best when suspended on the shady side of the warmest house.

THE KITCHEN GARDEN.

By W. POPE, Gardener, Highclere Castle, Newbury.

Lifting and Storing Early and Second Early Potatoes.—The frequent thunder-showers of the last week or two are producing the usual effect upon Potato crops that may have finished, or nearly finished, their growth, and disease is setting in apace. Lifting should be followed up persistently at every favourable opportunity. Fine weather is indispensable for this, as the tubers need to be thoroughly dry before storing. When taken under cover they must be stored thinly for a week or two, and again sorted before finally storing in bulk. Seed required for another season's planting should be gathered up and stored separately, as some amount of air and light will benefit these rather than otherwise. Inferior varieties should be carefully noted, that they may be discarded in favour of good ones, of which there is now no lack. Some will suit certain localities and soil better than others. Late varieties are still growing strongly, and as long as strong growth continues the fungus spores will have but little effect upon them. Such varieties as *Magnum Bonum*, *Chancellor*, &c., are practically disease-proof, but all are best lifted as soon as the skins are set.

Cauliflowers.—Where an autumn-sowing of Cauliflowers is practised, the work should be done as soon as possible, selecting a warm corner, or a site under a south wall, for the purpose, and sow thinly in shallow drills. A slight dressing of superphosphate of lime, or dissolved bone, will assist germination, and help the plant through the earliest stage. As soon as large enough, prick the seedlings off singly into small pots, or into a frame where they may be afforded some protection through the winter. Coddling must always be avoided by affording plenty of air at every opportunity. Early London, Walcheren, and Veitch's Autumn Giant are good varieties for present sowing. Owing, however, to the now general practice of early spring sowing and forwarding the young plants under glass, autumn sowings have fallen greatly into disuse.

Old Cabbage Beds.—Beds of Cabbage that have yielded produce during spring and summer should be cleared off the ground, unless the supply of Savoy and other early winter produce is likely to be deficient, in which case the dead leaves, &c., should be cleared away, and a good soaking of liquid-manure afforded, the ground being afterwards hoed through deeply. A good supply of tender produce equal to young plants may thus be obtained. The plants from the first sowing of *Ellam's Early*, &c., should now be large enough to plant out from the seed-bed, and if too early for spring, will be certainly appreciated in November and December. Plant Coleworts also in quantity.

Winter Radishes.—Make a good sowing in firm ground that is not too rich. Sow the seed very thinly in shallow drills, 8 or 9 inches apart in an open sunny situation. China Rose is much the best variety for present sowing, being equally hardy with the black Spanish, and much more crisp and tender. The seed must be protected from birds.

PLANTS UNDER GLASS.

By G. H. MAYCOCK, Gardener, Luton Hoo Park, Luton.

Bulbs for Spring-flowering.—These should be potted at intervals of three weeks to form a succession of bloom. The majority of Narcissus and Daffodils will succeed best if potted-up at once. Mix a good quantity of loam that has been stacked for a few

months, with a liberal quantity of well-decayed leaf-mould and sand. Place this in a cool, dry shed, and it will make excellent potting-material for successional batches. The pots must be clean, and well drained with small crocks. Roman Hyacinths, Jonquilla, Paper-white Narcissus, Early Duc Van Thol and other Tulips, should receive first attention, to be followed with a good selection of named Hyacinths, Daffodils, Crocuses, Scillas, Iris, Snowdrops, and others. If large quantities of cut blooms are required for house and table decorations, and there are limited means of production, it will be well to use ordinary-sized cutting-boxes for some of the Narcissus and Tulips. Treated in the same way as those pots, they will yield large quantities of flower for cutting, and those grown in pots may be used for decorative purposes. When the bulbs have been potted, plunge them in a bed of coal-ashes, and protect them from heavy rains. They must not be allowed to remain in the ashes too long, and an examination should be made occasionally to ascertain whether they have commenced to push. Those bulbs ready for removal should be placed in a cool house or frame, and gradually inured to the light.

Freessias.—Those potted in July should be removed from the plunging material to a position on a shelf near the glass in a cool house. Afford support with neat stakes before the growth gets too long. Pot on successional batches, plunging the pots just over the rims only.

General Work.—Plants of *Hydrangea Hortensia* now past their best should be plunged in a suitable position out-of-doors, but some of the oldest pieces that have grown unsightly may be cast away or planted out-of-doors in a sunny spot in the pleasure-ground. Spring-struck cuttings may be potted on in good strong loam. These will make useful flowering plants next season. Tuberosees that are throwing up flower spikes should be removed to a warm house, where they may be fed well with manure-water; rub off all side shoots, and protect successional batches from heavy rains by placing the glass-lights over them. Those not yet showing flower should still be kept rather dry at the roots.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

Alpine Strawberries.—The present is a good time to plant strong-rooted runners of the Alpine (*Quatre Saisons*) Strawberry. Plant them in rows 1 foot apart and 6 inches from plant to plant, in ground which has had a dressing of manure dug into it recently. Make the soil firm about the roots when planting, and water in the absence of rain to settle the soil. *La Genereuse* (large red Alpine) is the best variety to grow. A border in front of a wall having an east aspect is best suited to the culture of the Alpine, because ripe fruits of this variety are not required until the summer Strawberries are past. The size and quality of the fruits depend in a great measure upon the treatment accorded to the plants, which will flourish in any kind of soil of fair depth and average fertility. In order to secure large clean fruits, place some flints closely together on the soil between the plants. These will not only preserve a more uniform degree of moisture in the soil about the roots than would otherwise be the case, but will prevent the ripe fruit coming in contact with the soil. The first, and sometimes the second flowers that the plants produce should be removed, inasmuch as they are not required until August, and if allowed to fruit early, they will the sooner cease to bear. There is a pleasant acidity in the flavour of the Alpine Strawberry which is pleasing. During autumn good dishes of it and the autumn-bearing Raspberry (*Belle de Fontenay*) are much appreciated, not only by the consumers but also by the gardener, who is responsible for a good dessert being placed on his employer's table.

Royal Hautboys.—This old variety is now seldom met with. It is quite distinct in both foliage and fruit from any and every other variety of the Strawberry in cultivation, and the fruit, owing to its peculiar flavour, is much prized by some persons. Rooted runners, if planted now in good soil, in rows 20 inches asunder, and at the same distance in the rows, making the soil firm about each plant, will yield a fair crop of its purplish-red coloured fruit. One or two rows, according to length of rows, will suffice if planted only with a view to placing on the dessert table a Strawberry quite distinct in shape, colour, flavour, and aroma from any other Strawberry. The number of plants grown can easily be increased if necessary.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Plums.

It was upon these popular fruits that Mr. A. H. PEARSON, of the Chilwell Nurseries, Nottingham, so admirably and exhaustively, as well as pleasingly, dilated at the Drill Hall meeting of the Royal Horticultural Society on Tuesday last, and to which so comparatively a small body of auditors listened. Mr. PEARSON's paper covered the subject of "Plums, and their Culture," so tersely and so aptly, that no one who gardens could have failed to find in it food for reflection. The lecturer not only greatly interested his audience, but provoked an interesting discussion, which helped to evoke yet farther valuable information. Residing and practising in the Midlands, Mr. PEARSON's experience may not, in every case, coincide with that of more southern Plum-growers; but all the same, he left little room for cavil.

A very important feature in the lecture was found in full reference, not only to means of propagation, budding being, of course, the chief one, but to stocks. As it was shown, so diverse are the characters or habits of Plums,

that some do best on the Mussell, or on the Brussels, or on the Mirabelle, as the case may be, and many had been the mistakes in the past, leading to premature death, or even to stragulation, arising from the putting good varieties on to the wrong stocks. Specially was it lamented, and the chairman, Mr. G. BUNYARD, coincided, that there was no dwarfing stock for the Plum, as was the case with the Apple and Pear, although that defect is somewhat mitigated by the fact that Plums as a rule are not such strong growers as are the fruits named. As bearing on this question, Mr. HAMMOND, a well-known Kentish grower, said that the half-standard form of tree was best for market-planting, as it soonest became fruitful, and was dwarfer than tall-worked standards, and early fruiting soon checked strong wood-development.

With respect to wall-trees, Mr. PEARSON deprecated the planting of common sorts like Victoria against south walls, where Plums of greater excellence should find a place, leaving cooler aspects for the Victoria and similar cooking varieties. He also advocated the method of horizontal training like that usually applied to Pears on walls, as "checking sap-flow" and promoting fruitfulness over a greater area. Mr. A. DEAN, however, contested this point on the ground that our finest stone-fruits always crop best on fan-shaped trees, whilst horizontally-trained Pears were not always cropping successes. Beyond which, there is the objection that gumming, is a too common complaint with Plums, causing branches to die. The loss of a branch on a horizontally-trained tree would involve a big gap, whilst in a fan-shaped tree new branches soon fill the void. With respect to the common expression by gardeners, "checking sap-flow," it is advisable that those employing this now hackneyed expression should have the fullest knowledge of what is involved in it. As commonly used among gardeners, it conveys a wrong idea as to the movements of the fluids in plants, but it is the phrase, not the facts, that may be objected to. Whilst physiologists now know for certain that the old notion of up-and-down sap-currents requires much modification, they have not as yet devised a clear explanation of the facts that undoubtedly do present themselves.

A wide list of varieties of Plums for various forms of culture was given, and those anxious for further information will find it all in a future issue of the Royal Horticultural Society's Journal. The lecturer ventured to express a belief that one reason for the complaints with respect to Plum gluts occasionally experienced, was due to the too liberal planting of the popular Victoria, and to the comparative neglect of other valuable varieties. That was, to employ a well-known simile, "putting too many eggs into one basket." He advised the growing of such early and late varieties as Czar, Monarch, &c., that the ripe season might be spread over a longer period, when better prices would be obtained. This view was generally held by Mr. HAMMOND, whose market experience is of the highest, but who all the same said, that in such markets as Spitalfields and the Borough, which were really the people's markets, it seemed impossible to have too many Victorias, for this Plum would sell in preference to other varieties, so popular is it. Possibly Mr. HAMMOND grows finer samples, and markets them more carefully, than do those who complain of gluts and low prices; indeed, we have great sympathy with Mr. PEARSON's dictum,

that good fruit always commands a good price. Naturally, the lecturer laid great stress on the importance of utilising surplus Plums for the making of jam, as this is not only a delicious fruit-compound, but it keeps well. But to make this practice at all profitable, it is needful to have the jam factory close at hand. In this way, the defects of one season are covered by the abundance of another. The preserving of Plums whole in bottles, though one of exceeding importance, escaped attention through want of time, and so far as concerns Plum-drying on the French system, our uncertain climate seems to fail to produce suitable fruit, or we do not grow the proper varieties. As to sending Plums to the dessert table the preservation of the "bloom" on the fruit was strongly advised, as when so preserved the fruits are not only much more beautiful, but are far more tempting, because they show that the fruits have had a minimum of handling. Arising from this matter it is difficult to avoid reference here to the general habit of placing these fruits in the shop windows in tempting condition, in boxes, practised by the French, and which we seem too obstinate to copy, yet that very tastefulness in packing for shop-sale means enhanced value to the fruits. Some shallow boxes of splendid Plums from Sawbridgeworth were shown in the hall, lined simply with common tissue paper. How much in this case would the French lace-paper have enhanced their beauty. The more the subject of Plums is considered the more illimitable the scope of it seems to be, and we join heartily with the audience of Tuesday last in awarding to Mr. PEARSON hearty thanks for his admirable discourse.

THESE gardens will probably soon cease to exist. During the past few months the affairs of the Society have been allowed to drift into a deplorable state. This has been followed by the discharge of nearly all the gardeners, the dismissal of the Curator, and finally the sale of the whole of the plants in the houses. All these retrogressive movements are alleged to be in opposition to the majority of shareholders of the gardens; those who are responsible for the breaking-up policy being a few individuals who are in possession of a large number of shares, having purchased them with no view to retaining the gardens as gardens, but as a speculation. It was at one time thought that the Sheffield Gardens would have passed into the hands of the Town Trustees, and have been put to better use than they ever were before, as, after passing into the hands of that body, they would have been public property, and open to the people of Sheffield for ever. The committee formed for preserving the gardens approached the Town Trustees, who promised to give £5000 towards buying up the whole of the shares at par value, which is £5 per share, providing the Preservation Committee could raise by subscription or gift of shares an additional £4000, the two sums being sufficient to purchase the 1800 shares at par value. This amount was raised, and at two meetings of the shareholders it was, we are informed, passed unanimously that the Society be dissolved, and passed over to the Town Trustees, on the understanding that that body would pay par value for the shares, viz., £9000. This would have passed, but for the Garden Committee raising an objection as to the legality of the proceedings, and now the

COUNTRY READING CLUBS & LITERARY INSTITUTIONS

Are Supplied on the following Terms:—

	Six Months.	Twelve Months.
THIRTY VOLUMES CLASS A }		
OR		
FIFTY VOLUMES CLASS B }	28 0 0	210 10 0

And THREE CLASS A or FIVE CLASS B VOLS. for every additional GUINEA per Annum.

REGULATIONS FOR ALL COUNTRY SUBSCRIBERS.

All lists and letters relating to exchanges must be received at the Library two days before the return of the books, and must state the number of volumes about to be returned, and contain whatever instructions are necessary. The fresh supply is sent immediately on receipt of the return box.

Separate lists of books wanted from Classes A and B should be furnished, and they must contain the titles of twice the number of volumes in each class required, and be selected from the published Library Lists or Catalogue.

kets, it seemed impossible to have too many Victorias, for this Plum would sell in preference to other varieties, so popular is it. Possibly Mr. HAMMOND grows finer samples, and markets them more carefully, than do those who complain of gluts and low prices; indeed, we have great sympathy with Mr. PEARSON's dictum,

informed, passed unanimously that the Society be dissolved, and passed over to the Town Trustees, on the understanding that that body would pay par value for the shares, viz., £9000. This would have passed, but for the Garden Committee raising an objection as to the legality of the proceedings, and now the

FIG. 41.—GRAMMATOPHYLLUM SPECIOSUM: SPIKE 7 FEET HIGH; FLOWERS 5 INCHES ACROSS. (SEE PP. 146, 150.)

affairs of this Society, the gardens of which were opened in 1896, stand in a most awkward position.

Edenical gardens formed by societies in the provinces have oftentimes a difficult matter to keep afloat, and have to resort to various ways of raising finances to carry them on, which are in too many cases far from what one looks for in such institutions. The Sheffield Gardens were, we are told, only in debt at the end of their financial year to the amount of £22, so that cannot be framed as an excuse for breaking them up. The houses in these gardens were a great attraction to the Sheffield public, and now that the contents have been disposed of, it is a question if the gardens are worth retaining, as there are two parks belonging to the town at no great distance from the botanical gardens. These gardens are a little more than 1½ acres in extent, and were laid out by the late ROBERT MARXCOCK, who, at the time, was Curator of them; they include a magnificent range of conservatories 340 feet in length, which is divided into eight compartments, the Palm-house occupying the centre. At the back of this range are the pits and frames, and seven other houses for cool and warm-house plants.

The Co-operative Festival.

THE National Co-operative Festival has once more been held with its exhibition of productive and distributing agencies, and its flower show, and judging from the extent of its industrial display, and the dimensions of its illustrations of farm and garden produce, it is yet in the full vigour of its operations. It needs such a building as the Crystal Palace, with its spacious grounds, to afford ample accommodation for these: for its conferences and meetings, its social gatherings, its choir competitions and sports, and its concert of some seven thousand voices, and the company of from 40,000 to 50,000 persons who usually attend it. On this occasion, the flower show had to be located in a huge tent erected on the terrace—600 feet in length by 40 feet in width—and in which the produce was seen to much better advantage than in the Palace, where the height and dimensions of the building dwarf plants and flowers out of all proportions. During the last few years it has been found necessary to divide the competition. The flowers, &c., furnished by the members and customers of the Agricultural and Horticultural Association compete on the Friday, the contributions to some 120 classes being judged on that day; and on the following day the same number of classes is much more numerously filled by contributions from the members of industrial co-operative societies, some of whom bring their produce from Scotland. This class of exhibitor, among which is to be found many enthusiastic and successful amateur gardeners, forms sixty-eight per cent. of the competition. In this section there was staged in the various classes twenty-nine complete collections of vegetables, comprising 174 dishes. One of these collections came from Scotland, two from the Midlands, three from the west, five from the north-west, eight from London and its suburbs, and ten from the South of England. By an equitable arrangement, the exhibitors in these several districts competed together, as it would be manifestly unfair to pit produce grown in colder districts of the north-west with that produced in the warmer south.

While plants and flowers are largely represented, the bulk of the garden produce is vegetables. These can be packed and conveyed to

London with much greater convenience and safety than plants and flowers; and of vegetables there were in the industrial section over 1000 entries. Most prominent were Potatoes, the beauty of many of the tubers recalling the Potato exhibitions held at the Crystal Palace a few years ago. Next came Beans, represented by 135 dishes. Turnips, Peas, Onions, &c., were also very numerous. The two weak points in the vegetable classes were Turnips and Cabbages, though some very good examples of each were shown; others—as an incidence of the season more than from any other cause—were rough and ill-shapen. The judges found it no easy task to select the four best out of, say, fifty dishes of white Kidney Potatoes, or the same number of Peas.

Every year the standard of quality rises to a higher level, so quickly have the exhibitors realised the preferences of the judges for those qualities which make for excellence that inferior exhibits are now few, and they come mainly from those who are competing for the first time.

In the cut-flower classes may be found the representatives of almost every flower that blooms in August. Dahlias were most numerous shown, especially the Cactus and Pompon varieties; the former especially would have done no discredit to the Exhibition of the National Dahlia Society. Asters and Marigolds were numerous also. There were many more Roses than might have been expected. Fragrant Sweet Peas were abundant, and Asters of all types. Many specimen-plants, showing successful culture, were staged; Ferns of tender character, Coleus, Fuchsias, Harrison's Musk, of which there were some excellent examples; *Lilium speciosum*, &c. It is quite certain that the range of choice of gardener-co-operator is large, and he is by no means slow to learn the value of high qualities in the strains he loves to cultivate.

The higher qualities of fruit came, of course, from the gardeners of members, and there were some very good collections. It is matter for great regret that one exhibitor deliberately endeavoured to mislead the judges by tying together fragments of bunches of Grapes to form a large one. Happily the attempt was discovered, and it is to be hoped the exhibitor is by this time heartily ashamed of himself.

One specially interesting feature was an exhibition of photographs of "Gardens of Taste," promoted by the Agricultural and Horticultural Association, and which was arranged in the Italian Court. Many of these were delightful, not only in the charming features they represented, but in the clearness and vividness of the pictures. In this same court was an exhibition of pot-plants grown in pure sand, having the aid only of pure chemical manures. There were five sets of plants, each grown in a different way—without manure, with manure from which nitrogen is absent, with manure minus phosphate, with manure without potash, and with the Association's manure, containing all these elements. In the latter case, perfect crops were found produced in the most sterile sand. These experiments appeared to have a great interest for the exhibitors, and in all probability supplied suggestions by which many cottage gardeners can overcome the difficulties experienced in many parts in obtaining suitable manures for their plots, and especially so in parts where but little of ordinary farmyard or stable manure is made. We have seen allotment gardens literally starved for want of adequate supplies of fertilizers.

Mr. E. O. GREENING, the indefatigable

director of the Festival, made a departure on this occasion, which was welcomed. On the afternoon of Friday he organised a meeting in one of the large dining-rooms for the purpose of a social gathering, at which Mr. J. WRIGHT, Mr. R. DEAN, and others of the judges delivered addresses on some topic related to the flower show. But this was but one of other gatherings, social and otherwise, which extended over the five days of the festival. It may be added that all the officials of the Palace write in expressions of warm praise of the conduct of the visitors, who appear to take the Festival seriously, and make it in the cases of many their annual visit to the south a time of calm, dignified, but thorough enjoyment.

GRAMMATOPHYLLUM SPECIOSUM.—The event of the week, horticulturally considered, has been the exhibition of a noble spike of this Orchid by Sir TREVOR LAWRENCE. An idea of it can be gleaned from our figure, repeated from a former volume. At the bottom of the spike in Sir TREVOR LAWRENCE's plant were two abnormal flowers, one of which is figured in fig. 41, p. 145. This flower had four nearly equal segments in two rows—no true lip and a straight column—a very common state of things among Orchids, and interesting as showing the probable derivation of the ordinary irregular Orchid-flower from a regular type. The plant is recorded to have flowered first in 1851 in Loddiges' nursery at Hackney, while a much finer specimen appeared in 1859 in the garden of W. G. FARMER, Esq., Nonsuch Park, Ewell, and subsequently another was flowered by Mr. SCOTT, gr. to Sir G. STAUNTON, Leigh Park. Mr. CURTIS, of Penang, a few years since sent us a photograph of a magnificent plant of this species of dimensions that we hesitate to cite. Unfortunately the photograph was unsuitable for reproduction. Another fine but much smaller specimen was imported by Messrs. SANDER & Co. of St. Albans. We gave a figure of the extraordinary snake-like pseudo-bulbs denuded of leaves, and with its curious ascending roots, at the back page of the index for vol. xiii., 1893. This specimen was presented to the Royal Gardens, Kew, by Messrs. SANDER, and forms now one of the most striking objects in the Victoria house. The roots have access to the water, and the plant is in vigorous health, and will no doubt flower in another season. The plant is a native of Java and other islands of the Indian Archipelago. The prevailing colour of the flower is dull yellow thickly dotted with reddish-purple spots. The pseudo-bulbs attain a height of 9 to 10 feet, and the flower-scape measures 6 feet and upwards in height. The flowers measure 5 to 6 inches across.

THE WOLVERHAMPTON CHRYSANTHEMUM SOCIETY.—At a recent meeting of this Society the present Chairman, Mr. G. A. BISHOP, tendered his resignation, owing to his retirement from the gardens at Wightwick Manor. The resignation was accepted with regret. Various members, including the vice-chairman, Mr. G. Bradley, Mr. R. Lowe, Mr. J. E. Knight, Mr. Simpson (Chairman of the Horticultural Club), and others, spoke to services rendered to the Society by Mr. BISHOP, and expressed their sense of the loss the Society must sustain. It is proposed to present Mr. BISHOP with a testimonial.

THE ANNUAL "OUTING" of the employees of Messrs. JOHN LAING & SONS, Forest Hill, took place on the 20th inst. About eighty persons journeyed to Eastbourne, accompanied by the heads of the firm, and an enjoyable day was spent.

NOTES FROM THE ISLE OF WIGHT.—The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Ventnor on August 7. Dr. J. GROVES presided over a fairly good audience. Mr. C. ORCHARD, Bembridge, read a paper on "The Progress of Horticulture in England during Her Majesty's reign." Mr. W. W. SKEATH of Macer, Ventnor, obtained the Association Certificate

for a group of flowering and foliage plants effectively arranged.

The Shanklin Horticultural Society held their eighteenth summer show in Rylstone Grounds by permission of M. SPARTALI, Esq., on August 18. The quantity and quality of exhibits far exceeded that of any previous show. Through the exertions of Mr. A. CARTER, Hon. Sec., and an energetic committee, the Shanklin Show is the largest and most popular in the Garden Isle.

The local horticultural society of the picturesque, fertile, and quite village of Niton held their third summer show in the grounds of Lady MARY GORDON at "The Orchard" on August 18. The exhibits

by PERCY LINDLEY, can confidently be recommended to all who are planning a continental trip this autumn. Among the new features of this edition of the Tourist Guide, are a series of maps and a chapter upon cycling routes in Holland, Belgium, and Germany. Not the least attractive features of the hand-book are the charming illustrations, and of quite another nature, the "dull, useful information" as to expenses, luggage, &c.

THE BIG GOOSEBERRY.—A competition has just been held by Messrs. STUART & MAX, Kelso, N.B. The firm make a speciality of the fruit, and recently their customers were invited to send their

Laos, where it clammers over rocks, &c., like Ivy, but so vigorously that, according to M. Voinier, it would soon cover a cathedral. It has stout Rhopala-like stems and alternate trifoliate leaves with long stout petioles, each leaflet being oblong-obovate, 4 inches by 5, the margins serrate, the nerves very prominent, rich glossy green above, the under surface covered with soft hairs. It is said to have enormous grape-like fruit, with large seeds, and to be of peculiar flavour. A plant of it recently added to the Kew collection bears out this description in regard to vigor of growth and the characters of the leaves. *W. Watson in Garden and Forest.*

SHIRLEY DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.

The monthly meeting was held at the Parish Room, Shirley, Southampton, on Monday, 16th inst. Mr. S. HEATON, Lecturer in Horticulture to the Isle of Wight County Council, gave an address on the diseases of plants. The lecturer dealt with the subject under three heads—(1) parasitic and insect attacks; (2) deleterious gases, &c., in the air affecting nutrition; (3) a redundancy or deficiency of light, air, moisture, and warmth. Careless transplanting and pruning might also cause serious injury, whilst the absence of proper plant-food, and an excess of organic-matter in the soil, were commented on as fruitful sources of disease. As to combating diseases, the lecturer recommended in severe cases the total destruction by fire of the plants, and in light attacks, persistent spraying.

HAILSTORM AT ACTON, GUNNERSBURY, AND LOCALITY.

On Wednesday last, August 25, about noon, a terrific hailstorm burst over this immediate district, accompanied with heavy peals of thunder and most vivid lightning. The damage done in Acton is most grievous to witness, more especially amongst the many market florists of the neighbourhood. A hurried visit paid to Mr. HUMBY'S Nursery in the Mill Hill Road, revealed such a destruction amongst growing plants still standing outside, and in broken glass, as could scarcely be credited were it not seen. A large stock of Chrysanthemums, which in the morning were the picture of health, were broken and stripped of their foliage in the most surprising manner, other things also suffering extensively (samples of this injury done are sent by the post also). When seen six hours after the storm had burst, hailstones by the barrow-load could be gathered up, many of these, as measured then, being fully an inch in diameter. In this district, too, there are some very pretty villa gardens, which are completely denuded of flowers; and the foliage completely riddled. The foliage of the trees is also stripped off so as to cover the ground quite thickly, some of the trees being almost bare. Other nurseries have also suffered seriously, Mr. PIKE'S being another instance. At Gunnersbury the damage is not apparent; the hailstones here ranged up to the size of nuts; of these there was an enormous quantity. In all probability we shall see more signs of the injury done in a few days' time. The Aucuba shoots enclosed are from a villa garden in Acton [the leaves are reduced to tatters]. *J. Hudson.*

FIG. 42.—BASAL FLOWER (MALE) OF SIR TREVOR LAWRENCE'S SPIKE OF GRAMMATOPHYLLUM SPECIOSUM. (SEE PP. 146, 150.)

were numerous and of excellent quality; the competition being keen in most classes.

The two days' show of the local horticultural society at Freshwater was held on August 18 and 19 in Farringford Park by the permission of Rt. Hon. Lord Tennyson. The exhibits were not so numerous as last year, but the quality of exhibits was good. Better staging and labelling however would be to the advantage of the visitors.

HUDDERSFIELD CHRYSANTHEMUM SOCIETY.

—Owing to the numerous calls on the inhabitants for funds on account of the Indian famine, the Jubilee, &c., it has been decided not to hold the show this year, but to await a more normal condition of the exchequer.

"TOURIST GUIDE TO THE CONTINENT."

This, the Great Eastern Railway Co.'s Guide, edited

largest berries to compete for a gold medal. The winner was a specimen of "Ringer," a deep olive-green skinned variety, and it weighed 22 dw. Mr. T. E. MIDDLETON, Radcliffe-on-Trent, was the grower. Numerous specimens weighing 17 to 20 dw. came from the district embracing Lancashire, Yorkshire, Cheshire, Staffordshire, &c. The heaviest varieties were Ringer, Bobby, London, Lord Derby, and Queen of Trumps. The berries generally are said to be smaller this season than usual.

VITIS VOINIERIANA.—This is a suggested new species in the way of Voinieriana antarctica, but of much larger proportions. It is being distributed by M. Sallier, nurseryman, Neuilly, France, who recommends it for outside cultivation in the west and south of France and for winter gardens in England. It was received by M. Charles Baltet from M. Voinier, of Tonkin, who found it on the Nin-Binh mountains in

HOME CORRESPONDENCE.

BLACKBERRIES.—It is instructive to note that whilst Mr. Wadds finds that very fine American Blackberry, Kittatiny, to thrive best at Cliveden, on a somewhat moist soil, that is even partly under water in the winter, the more famous Parsley-leaved bramble, *Rubus laciniatus*, evidently does best in a much drier position. How well it does thrive in drought, though the soil is of a somewhat stiff and not at all generous nature, may be seen at Maiden Erleigh, Reading, where Mr. Turton has it on a long wire-trellis, where it has been fruiting splendidly. The brambles are fronting to the south-east, and are planted some 15 feet apart. The trellis, which is composed of about six stout strands of wire attached to iron uprights, is 6 feet in height and 150 feet long. The oldest planted brambles having now become strong, entirely cover the space allotted to

each plant, having long stout growths or rods, fruiting very heavily and finely. So much are the berries in demand in Reading, that ten times as many as the trellis produces could easily be sold at highly remunerative prices. Seeing that the fruits are ripe usually a month before our best wild ones, are far finer and much sweeter, it is remarkable that no one so far seems to have embarked in the culture of this fine bramble on a market scale. Without doubt there is money in it, especially if warm, sunny sites, on a deep, retentive soil, be chosen. The ripening season is midway between that of the Raspberry and the wild Blackberry. *A.D.*

CHOICE OF VARIETIES OF STRAWBERRIES.—The advice given on this matter by your correspondents would be more valuable did they state the nature of the ground they have to deal with. We have here a light, sandy loam in which many of the sorts strongly recommended are practically useless, as we have found to our cost. Of the sorts which are really satisfactory in every respect, we have only found four, President, Gunton Park, Royal Sovereign, and Waterloo. We have tried dozens of kinds which have been recommended by various persons, and all more or less have been failures. *Thos. Fletcher, Grapenhall, Cheshire.*

CELOSIA AS BEDDING-OUT PLANTS.—Anyone visiting Ravenscourt Park, Hammersmith, during the next few weeks, will have an opportunity of seeing to what good account *Celosia pyramidalis plumosa* is turned to as a "bedder." The plants are admirably grown, and the colours distinct, ranging between soft yellow, gold, and rich crimson. Some are planted in masses, sufficient room being allowed to each plant to develop its true character, with the result that each mass or bed so planted appeared to be composed of specimen-plants. The same may be said of plants intermixed with other subjects. The superintendent is to be complimented upon the success of his work, and the appearance of his flower-beds. There is evidence of his skill as a landscape-gardener at every turn and corner of the park. *H. W. W.*

BRICK-COVERED VINE-BORDERS.—Having seen the Vine-borders at Combe Abbey last September, I can endorse all that Mr. Miller has said respecting them. The appearance of the Vines, and the quality of the fruit, bear testimony to his system of Grape-growing being the correct one. I may add that the brick-coverings are placed about an inch apart, so that the air is not excluded from the borders; at the same time they retard evaporation, and being absorbent, hold a quantity of moisture after watering and damping down. They also give the borders a more tidy appearance than the ordinary mulching of manure. Mr. Miller called my attention to the quantity of fibrous roots underneath the bricks; several bricks on different parts of the borders were removed, and in each case there was a mass of feeders under them. *H. Stark, Kingswood, Birmingham.*

— On taking charge of the gardens at Aston Rowant House, Oxford, some two years and a half ago, I found the vine-borders there covered with bricks. Not having seen or heard of such a practice before, I was very adverse to it. Lady Chichele Plowden, who has a knowledge of fruits, and fruit-culture, and is a thorough gardener and botanist, informed me the practice had been attended with success in previous years. I therefore closely watched the results, giving the Vines the usual orthodox treatment. The Grapes in the Muscat vineyard, which contained three varieties, and were planted two years previous, carried good bunches, well ripened and finished. The adjoining vineyard, planted with all black varieties, and canes about twenty-five years old, proved equally satisfactory under the "brick" treatment, and carried very fine, well-finished bunches also. My practice differed somewhat from that Mr. Miller described in your last issue. I removed the bricks from the borders in the autumn, not replacing them again until the house was ready for starting, placing long boards on the borders to walk upon. I found upon examination under the bricks, the surface of the border was a network of white fleshy roots or feeders. These roots to some extent perished by allowing the bricks to remain on them. I therefore removed them, at the same time covering the surface of the border with loam. My experience is that brick-covered vine-borders require to be watered with great care, especially so if the soil is of a retentive nature. A great many of the bricks I used were hollowed out on the one side. The concave side being placed upper-

most held the manure water with which the houses were damped down. *W. H. Clarke, Wellington, Somerset.*

MALVA ALCEA.—This is a good and useful plant for the wilder parts of the garden, remaining in full flower for six weeks from the beginning of August. It is sold in nurseries under two or three names, being a variable plant: it is a native of the South of Europe, and is perennial from a hard woody base, and does not last more than three or four years, but seedlings come in abundance round the parent. It grows about 5 or 6 feet high when full grown, and is not particular about soil or surroundings. There is nothing ornamental about it when out of flower. The flowers are large, and coloured clear rose, the colour of those of our native *Malva moschata*. It seems to form spontaneous hybrids freely with that species, of which in its white variety a large number grow in the rough parts of this garden. Many of the hybrids are white, but I have never had the type white, though it probably might be found white in its native home. The plants are much branched, and as there is a quick succession of flowers on each twig, they are useful for cutting. *C. Wolley-Dod, Edge Hall, Malpas.*

A SOUTH OF ENGLAND CARNATION SHOW.—Unlike "A. D.," I cannot bring myself to contemplate with much favour the proposal to found a Southern Counties Carnation Society. If there are enough growers at Southampton to form a small local society, well and good; but, seeing that the county of Hampshire adjoins Surrey and Berks, and comes very near to Bucks and Middlesex, it appears to needlessly trench upon the ground already covered by the London Society. If the Southern Counties require a new society, the western and eastern will likely follow suit, and then we shall have the Carnation interest broken up into a series of minor societies, each one of which will find it extremely difficult to maintain its organisation if formed. The circular signed by "W. Garton, Junr.," reveals too much. He proposes to induce "amateurs" to become members of his new society by expressing his willingness to supply them with twelve good and well-rooted plants of different "varieties," which appears to me to be playing down somewhat low. Every amateur cultivator of the Carnation so-called is more or less a dealer in plants, and I have a shrewd suspicion that what W. Garton, Junr., seeks to accomplish, is the formation of a centre, by means of which he may dispose of his surplus plants, as he somewhat significantly remarks that he "purposes to set aside out of his large stock every season a certain number of plants to be distributed among this class of competitors." I presume he means to sell them to these competitors, especially as the circular further sets forth that the "annual subscription is fixed at 5s., and is to go to the prize fund," which, I presume, means that the promoter will bear the expenses of organisation and working. This same vicious principle is in operation in connection with the National Auricula and Carnation Societies, as gifts of seeds are held out to induce persons to subscribe. This is subversive of legitimate trade. For my own part, as an old florist, desirous of upholding the best traditions of floriculture, I hope the attempt to form a Southern Carnation Society will signally fail. *An Old Florist.*

THE FAULTY FRUIT CROP.—In reply to "A. D.'s" inquiry in your last issue, I have thinned the blossoms on fruit-trees on a moderate scale in the spring. Most of them have been Pear-trees that were profusely covered with bloom; a few Apples also, including Cox's Orange Pippin. The trees are Standards and Pyramids eight to twelve years old in a garden on a fair slope to nearly due south with excellent protection; soil fairly heavy. Varieties of Pears, Williams' Bon Chrétien, Beurré Diel (Standards), with the same sorts, and also Marie Louise, Superfin, Louise Bonne, Doyenné du Comice, and various others, as Pyramids. Only Thompsons and Nouvelle Fulvie are grown on a south wall, and had no protection. The disbudding was done from about four to two weeks before flowering, and it relieved the trees of from 40 to 70 per cent. of promising buds, even more, but results are uniform—practically a complete failure of fruit. A striking exception is a young Standard Pear, transplanted in the spring of 1895 into line with other standards. After similar disbudding, this tree is bearing a crop of four dozen fruits, reduced to one on each bunch, where five to eight Pears originally set to each bunch. Although this tree flowered simultaneously with the

other standards, [the result is striking. The other standards gave a moderate crop last year when there were none on the recently transplanted tree. I believe the abundant rains last autumn have been the cause of producing weakly flowers, and it may be that the warm, damp month of March this spring may have accentuated the evil, followed as it was by such trying weather in April and May. *H. H. R., Forest Hill.*

BRITISH ASSOCIATION.

THE following extracts relating to the progress of physiology are taken from a report in the *Times* of Prof. Michael Foster's address to the section of physiology now in session at Toronto:—

"But there is a still larger outcome from the professorial chair and the physiological laboratory than the training of the student; these are opportunities not for teaching only, but also for research. And, perhaps, in no respect has the development during the past thirteen years been so marked as in this. Never so clearly as during this period has it become recognised that each post for teaching is also a post for learning, that among academic duties the making knowledge is as urgent as the distributing it, and that among professorial qualifications the gift of garnering new truths is at least as needful as facility in the didactic exposition of old ones. Thirteen years have seen a great change in this matter, and the progress has been perhaps greater on this side of the water than on the other, so far as English-speaking people are concerned. We on the other side have witnessed with envy the establishment on this side of a university, physiology having in it an honoured place, the keynote of which is the development of original research. It will, I venture to think, be considered a strong confirmation of my present theme, that the Clark University at Worcester was founded only ten years ago. And here, as an English-speaking person, may I be allowed to point out, not without pride, that these thirteen years of increased opportunity have been thirteen years of increased fruitfulness. In the history of our science, among the names of the great men who have made epochs, English names, from Harvey onwards, occupy no mean place; but the greatness of such great men is of no national birth—it comes as it lists, and is independent of time and of place. If we turn to the more everyday workers, whose continued labours more slowly build up the growing edifice and provide the needful nourishment for the greatness of which I have just spoken, may I, I will dare to say, affirm that the last thirteen years have brought contributions to physiology, made known in the English tongue, which, whether we regard their quantity or their quality, significantly outdo the like contributions made in any foregoing period of the same length. Those contributions have been equally as numerous, equally as good on this side as on the other side of the waters.

The development of which I have spoken is an outcome of the progressive activity of the age, and the dominant note of that activity is heard in the word "commercial." Noblemen and noblewomen open shops, and every one, low as well as high, presses forward towards large or quick profits. The very influences which have made devotion to scientific inquiry a possible means of livelihood, and so fostered scientific investigation, are creating a new danger. The path of the professor was in old times narrow and strait, and only the few who had a real call cared to tread it; nowadays there is some fear lest it become so broad and so easy as to tempt those who are in no way fitted for it. There is an increasing risk of men undertaking a research, not because a question is crying out to them to be answered, but in the hope that the publication of their results may win for them a lucrative post. There is, moreover, an even greater evil ahead. The man who lights on a new scientific method holds the key of a chamber in which much gold may be stored up; and strong is the temptation for him to keep the new knowledge to himself until he has filled his fill, while all the time his brother-inquirers are wandering about in the dark through lack of that which he possesses. Such a selfish withholding of new scientific truth is beginning to be not rare in some branches of knowledge. May it never come near us!

THE NERVOUS SYSTEM.

Fruitful as have been the labours of the past dozen years, we may rightly consider them as but the earnest of that which is to come; and those of us who are far down on the slope of life, may wistfully look forward to the next meeting of the Association on these Western shores, wondering what marvels will then be told. Physiology, even in the narrow sense to which, by emphasis on the waver ng barrier which parts the animal from the plant, it is restricted in this section, deals with many kinds of being, and with many things in each. But, somewhat as man, in one aspect a tiny fragment of the world, still more of the universe, in another aspect looms so great as to overshadow everything else; so the nervous system, seen from one point of view, is no more than a mere part of the whole organism, but seen from another point of view, seems by its importance to swallow up all the rest. As man is apt to look upon all other things as mainly subserving his interests and purposes, so the physiologist, but with more justice, may regard all the rest

of the body as mainly subserving the welfare of the nervous system; and, as man was created last, so our natural knowledge of the working of that nervous system has been the latest in its growth. But, if there be any truth in what I have urged to-day, we are witnessing a growth which promises to be as rapid as it has seemed to be delayed. Little spirit of prophecy is needed to foretell that in the not so distant future the teacher of physiology will hurry over the themes on which he now dwells so long, in order that he may have time to expound the most important of all the truths which he has to tell—those which have to do with the manifold workings of the brain.

And I will be here so bold as to dare to point out that this development of his science must, in the times to come, influence the attitude of the physiologist towards the world, and ought to influence the attitude of the world towards him. I imagine that if a plebiscite, limited even to instructed, I might almost say scientific, men, were taken at the present moment, it would be found that the most prevalent conception of physiology is, that it is a something which is in some way an appendage to the art of medicine. That physiology is, and always must be, the basis of the science of healing is so much a truism that I would not venture to repeat it here were it not that some of those enemies alike to science and humanity, who are at times called anti-vivisectionists, and whose zeal often outruns, not only discretion, but even truth, have quite recently asserted that I think otherwise. Should such an hallucination ever threaten to

nervous action, and a fuller, exacter knowledge of the laws which govern the sweep of nervous impulses along fibre and cell, give us wider and directer command over the moulding of the growing nervous mechanism and the maintenance and regulation of the grown one—then, assuredly, physiology will take its place as a judge of appeal in questions not only of the body, but of the mind: it will raise its voice not in the hospital and consulting room only, but also in the senate and the school.

SUPPLY OF FUEL.

Lord Kelvin, speaking on the fuel and air supply of the earth, said that all the known fuel on the earth is the residue of ancient vegetation. One ton of average fuel takes 8 tons of oxygen to burn it, and therefore its vegetable origins, decomposing carbonic acid and water by the power of sunlight, gave three tons of oxygen to our atmosphere. Every square metre of the earth's surface bears 10 tons of air, of which 2 tons is oxygen. The whole surface is 134 thousand millions of acres, or 510 million millions of square metres. Hence there is not more than 840 million million tons of fuel in the earth; and this is probably the exact amount, because it is probable that all the oxygen of our atmosphere came from primeval vegetation. The surely available coal supply of England, Scotland, and Wales was estimated by the Coal Supply Commission of 1881, which included Sir Roderick Murchison and Sir Andrew Ramsay among its members, as being 146 thousand million tons. This is approximately six-

Floral Committee.

Present: W. Marshall, Esq., chairman; and Messrs. O. Thomas, Chas. T. Drury, H. B. May, R. Dean, Geo. Stevens, J. F. McLeod, Chas. Jeffries, J. D. Pawle, Jas. Walker, Geo. Nicholson, Jno. Fraser, H. J. Jones, R. M. Hogg, and J. Fraser.

A First-class Certificate was awarded to *Ficus radicans* variegata, eight plants of which were shown by Mr. W. BULL, New and Rare Plant Establishment, King's Road, Chelsea. These are graceful and ornamental. The variegation is good, and is always, from the margin of the leaf inwards, in most cases, there being but little green left. Mr. BULL also showed two plants of *Musa superba*.

Several new Carnations, including selfs and yellow-ground Picotees were shown by Mr. G. H. McCULLOCH, Dissington, Hall, Northumberland.

A few Roses were shown by Messrs. W. PAUL & SONS, Waltham Cross. Good new varieties like *Empress Alexandra* of Russia, T., *Waltham Standard*, H.F., and *Aurora*, a H.T. bedder, were included.

Sprays of the erect species of *Clematis* known as *Davidiana* were shown by Sir TREVOR LAWRENCE, Burford, Dorking (gr., Mr. Bain). The flowers are small, blue, and are produced in whorls, whilst the foliage is large and Dahlia-like.

Clumps of Heather, very suggestive of the moors, came

FIG. 43.—MR. MCINDOE'S FIRST-PRIZE EXHIBIT OF SIXTY DISHES OF FRUIT IN THE VICTORIAN FRUIT CLASS AT THE SHREWSBURY SHOW.

(Mr. McIndoe was also awarded the Special Victorian Medal offered by the President to the Champion Exhibitor. See Report in our last issue.)

possess me, I should only have to turn to the little we yet know of the physiology of the nervous system and remind myself how great a help the results of pure physiological curiosity—I repeat the words, pure physiological curiosity, for curiosity is the mother of science—have been, alike to the surgeon and the physician, in the treatment of those in some way most afflicted maladies, the diseases of the nervous system. No, physiology is, and always must be, the basis of the science of healing; but it is something more. When physiology is dealing with those parts of the body which we call muscular, vascular, glandular tissues and the like, rightly handled she points out the way not only to mend that which is hurt, to repair the damages of bad usage and disease, but so to train the growing tissues and to guide the grown ones as that the best use may be made of them for the purposes of life. She not only heals, she governs and educates. Nor does she do otherwise when she comes to deal with the nervous tissues. Nay, it is the very prerogative of these nervous tissues that their life is, above that of all the other tissues, contingent on their environment and susceptible of education. If increasing knowledge gives us increasing power so to mould a muscular fibre that it shall play to the best the part which it has to play in life, the little knowledge we at present possess gives us at least much confidence in a coming far greater power over the nerve-cell. This is not the place to plunge into the deep waters of the relation which the body bears to the mind; but this at least stares us in the face—that changes in what we call the body bring about changes in what we call the mind. When we alter the one we alter the other. If, as the whole past history of our science leads us to expect, in the coming years a clearer and clearer insight into the nature and conditions of that molecular dance which is to us the material token of

tenths of a ton per square metre of area of Great Britain. To burn this quantity would take one and eight-tenths of a ton of oxygen, or within two-tenths of a ton of the total oxygen of the atmosphere resting on each square metre of Great Britain. The Commission estimated 56 thousand million tons more of coal as probably existing at the present in lower and less easily-accessible strata. It may, therefore, be considered as almost quite certain that Great Britain could not burn all its own coal with its own air, and therefore that the coal of Great Britain is considerably in excess of the fuel supply of the rest of the world reckoned per equal areas whether of land or sea.

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 24.—Seldom is there so small a display at the fortnightly meetings than was the case on Tuesday last in the Drill Hall, James Street, Westminster. Horticulturists are evidently taking their holidays in numbers, and the attendance was in proportion to the exhibition. Orchids were very few, but amongst them was a spike of the Mammoth *Grammatophyllum speciosum* shown by Sir TREVOR LAWRENCE (figured on p. 145). Among other exhibits, the most prominent were Dahlias and Lilies. A moderate quantity of fruit was shown, including an excellent new Melon from the Royal Gardens at Frogmore. Mr. A. H. PEARSON delivered an interesting and able lecture upon Plums.

from Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery Chelsea. The varieties included *Erica vulgaris*, *E. v. variegata*, *E. v. aurea*, *E. v. fl. pleno*, *E. v. Hammondii* (white), *E. v. cuprea*, *E. v. monstrosa*, and *E. v. Alporti*, the last-named being one of the most showy. *E. cinerea alba* and *E. Mackayana* were included. Allied to the *Ericas* is *Menziesia*, from North America and Japan. *M. polifolia* *atro purpurea* and *M. p. alba* were well shown. This plant is more correctly named *Daboecia polifolia*. Flowering sprays of *Rhus glabra* (coccinea) and *R. Osbeckii* were likewise from Messrs. Veitch (Silver Banksian Medal).

PURNELL PURNELL, Esq., Woodlands, Streatham, exhibited a group of miscellaneous plants, which included well-grown *Fuchsias*, *Dracaenas*, *Caladiums*, *Ferns*, &c. (Silver Flora Medal).

From Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham, was shown a collection of Dahlias blooms in sprays. This included *Cactus*, *Show*, *Pompon*, and other varieties, and was awarded a Silver Flora Medal. In addition to the above, a few good *Glaudiolus* were shown in spikes, including one named *Rev. W. Wilks*; also *Montbretias*, and blooms of *Lilium Letichlini*, pale yellow with purple-coloured spots.

Messrs. R. WALLACE & Co., Kilnfield Nurseries, Colchester, made the brightest display in the hall with a stand of *Lilium* blooms, *Glaudiolus*, &c. Varieties of *L. speciosum*, *L. tigrinum*, *L. Batemannii*, and other species; also some new *Glaudiolus* and *Tritonias* were noticed (Silver Flora Medal).

By far the largest exhibit on this occasion was a monster group of *Caladiums* from the nurseries of Messrs. JNO. LAING & SONS, Forest Hill, S.E. It was arranged upon the floor in an irregularly-faced group, and the *Caladiums* were freely interspersed with graceful *Palms* and *Ferns*. The

Caladiums represented many new and choice varieties, and the exhibit generally was highly praiseworthy. A smaller group of well-coloured medium-sized Crotons from the same nurseries deserves commendation (Silver-gilt Flora Medal).

Hibiscus Manihot was shown by F. D. LAMBERT, Esq., Moor Hall, Cookham (gr., Mr. Fulford). The plants were about 6 feet high, had *Aralia* like foliage, and bore numerous very large yellow flowers on an erect spike.

DAHLIAS.—Show, Cactus, and Pompon varieties came from several sources, the Cactus types predominating. Mr. J. GREEN, Norfolk Nurseries, Dereham, sent by post several blooms each of Cactus varieties of a decidedly promising character, but the way in which they were shown, and the small size of the blooms, detracted from their actual value. The best varieties were Indian Prince, Midnight Sun, Mr. Moore, Norfolk Hero, and Royal Purple. The committee requested to see them again in better condition.

Mr. J. STREDWICK, Silverhill, St. Leonards, had some varieties of decided promise two of which received Awards of Merit, viz., *Night*, maroon-crimson, the tips bright wine-crimson, a large true Cactus, with full flowers, having a better centre than those of *Matchless*, of which it is a brighter type; and *Amber*, yellow ground, the points of the petals deep amber, very bright and effective, a great improvement on *Harmony*, having much more of the true Cactus character. Two others are also good, viz., *Porcupine*, bright crimson, shaded with maroon, the florets somewhat erect; and *Frank Woodgate*, bright orange, somewhat distinct in colour, though much resembling *Mrs. A. Beck*, both the foregoing being true Cactus types.

From Mr. C. TURNER, Royal Nursery, Slough, came some charming new Pompon varieties, to three of which Awards of Merit were made: viz., *Vesta*, white, of perfect shape, though as shown a little deficient in the centre, as well as in purity of colour, defects which time may remove; *Phryne*, deep yellow, distinctly and regularly edged with bright salmon-red, distinct and attractive; and *Hypatia*, bright terra-cotta, a distinct shade of colour with a rosy tint thro' and over it, and lemon centre of perfect shape and centre. Others were *Ida*, yellow, heavily tipped with rosy-carmine; *Madeleine*, yellow, distinctly tipped with rosy-purple, very pretty; and *Edna*, a small bright crimson self; also *Marjorie* fellows, an attractive show variety, amber-yellow, with clear yellow centre, and having a tip or shading of puce-mauve (Award of Merit).

From Mr. G. ST. PIERRE HARRIS, Orpington, came four new show varieties: viz., *Barmid*, *Freedom*, *Mariner*, and *Singularity*, which will no doubt be seen in better condition later on.

Orchid Committee.

Present: H. J. Veitch, Esq., Chairman and Messrs. De B. Crawshaw, H. J. Chapman, W. H. White, J. T. Sabriel, W. H. Young, E. Hill, T. W. Bond, W. Cobb, A. H. Smece, A. Mason, and H. M. Pollett.

A First-class Certificate was unanimously awarded to *Grammatophyllum speciosum*, a spike (upwards of 7 feet in length) of which was shown by Sir TREVOR LAWRENCE, Burford, Dorking (gr., Mr. W. H. White). The flowers are yellow, spotted chocolate or reddish-purple, and are well portrayed in the accompanying illustrations (see figs. 41, 42).

A Gold Medal was deservedly awarded it, in addition to the First-class Certificate. From Sir Trevor's garden also came *Laelio-Cattleya Janet*, a very pretty hybrid, its white lip, with coloured margin and orange throat being very attractive.

Mr. W. BULL, King's Road, Chelsea, obtained an Award of Merit for *Goodyera Rolissoni*. The leaves are velvety-green, with golden-yellow margins, and occasionally variegated through the lamina in several places.

An Award of Merit was recommended to *Laelio-Cattleya Juna*, shown by N. C. COOKSON, Esq., Oakwood, Wylam-on-Tyne. It is a hybrid from *C. Mossie* and *L. majalis*. The flower is neat and compact, sepals and petals very pale rose, sepals slightly tinged with yellow at the tips, lip not coloured very deeply, throat orange, with cream-coloured veins—a pretty flower, with curious blendings of colour.

R. L. MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. Chapman), exhibited *Laelio-Cattleya Andreana* (a cross between *Laelio-Cattleya elegans* and *Cattleya bicolor*); all the flower except the lip is practically white, shaded faint rose on the exterior. The lip is recurved back at the point, which, in proportion to the base of the lip, is rather spreading. Tip of lip handsomely coloured, and the flower generally pretty. *Masdevallia Lowii* was shown from the same gardens.

Messrs. JAS. VEITCH & SONS, Chelsea, were awarded a Silver Banksian Medal for a small group of hybrids. This included *Laelio-Cattleya Nysa* (crispa ♀, × *Warszewiczii* ♂), remarkable for a very fine lip; *L.-C. Parysatis*, *L.-C. Prosperine superba*, &c. *Cattleya intertexta* was shown in flower; it has a curiously mottled lip. Also *Cypripedium Janet* and *C. melanthus* (Hookeri ♀, × *Stoneli* ♂), an elegant flower and spike.

Messrs. F. SANDER & CO., St. Albans, had *Catasetum fimbriatum* in bloom; also *Laelio-Cattleya Sanderae* and *L.-C. Robin Measures*. The sepals and petals are yellow in each case, but the lip differs in shape and colouring; the latter is also a larger flower. The collection included *Laelia amanda*, and a hybrid between *Laelia pumila* and *C. Harrisoniae* violacea, &c.

Messrs. HUGH LOW & CO., Clapton, had *Cypripedium Alfred Hellington*, a very pretty form of *Laelio-Cattleya Canhamiana*, and *L.-C. Harrisoni* prestans.

CHAS. L. N. INGRAM, Esq., Elstead House, Godalming, showed *Laelio-Cattleya* × *Radiance* (*L. purpurata* Dominiana × *C. Dowiana*). Another *Laelio-Cattleya*, named

Ruby Gem, from *Cattleya Lawrenceana* × *Laelia elegans*, had a neat flower, with well-coloured lip. *Cypripedium gracile*, from C. Haynaldianum × *C. Swanianum*, has narrow petals, marked with prominent chocolate spots. The lip is light purple, and the flower generally is attenuated in appearance.

Fruit Committee.

Present: Philip Crowley, Esq., Chairman, and Messrs. Jas. H. Veitch, A. F. Barron, W. Pope, A. H. Pearson, Alex. Dean, G. S. Miles, H. Balderson, G. Norman, Robert Fife, and F. Q. Lane.

The only Award of Merit recommended by the committee was that to a seedling Melon named *Frogmore Scarlet*, several fruits of which were shown by Mr. O. THOMAS, Royal Gardens, Frogmore. The fruits were above medium size, closely, but not prominently netted, exterior straw-coloured, flesh scarlet, and quality first-class.

Mr. GEO. WYTHES, gr. to Earl Percy, Syon House, Brentford, showed thirty Melon fruits of moderate size, but good appearance. These were of the variety *Middlesex Hero*. Mr. Wythes had also a seedling Melon from a cross between *Middlesex Hero* and *Beauty of Syon*.

A collection of Grapes from Captain MACDONALD, Hurst Side, West Moulsey (gr., Mr. G. Elliott), was awarded a Silver Knightian Medal. It included three bunches of *Foster's Seedling*, six bunches of *Gros Maroc*, and a equal number of *Madresfield Court*. The quality of the collection deserves praise, the berries and bunches being large and generally well-finished.

Mr. A. H. RICKWOOD, gr. to the Dowager Lady FRAKE, Fulwell Park, exhibited a commendable collection of fruit, including thirteen dishes of Peaches, two of Pears and four of Apples, also Morello Cherries, Red and White Currants, four dishes of Plums, and three bunches of Black Hambro Grapes (Silver Banksian Medal).

From Messrs. T. F. RIVERS & SON, Sawbridgeworth, were exhibited bunches of *Gradiška*, *White Grape*, and *Directeur Tisserand*, *Black Grape*. Also splendid examples of *Late Transparent Gage Plum*, *Golden Transparent Gage*, and *Monarch*, all from pot trees, grown in a warm house.

Messrs. GEO. BUNYARD & CO., Maidstone, illustrated the exceptional crop of Nuts of the present season by showing a collection of twenty varieties of Cob Nuts and Filberts. Some of the clusters were remarkable, especially the variety, *Duke of Edinburgh*, a variety certificated in 1883.

A collection of vegetables from Mr. T. ROBINSON, gr. to W. LAWRENCE, Esq., Elmsfield House, Hollingbourne, was deservedly awarded a Silver Banksian Medal. There were good Carrots, Potatoes, Turnips, Cabbages, Onions, Beans, Celery, Tomatoes, Beet, Cucumbers, Parsnips, and Marrows.

A collection of eighteen nice specimens of *Covent Garden Favourite* Cucumber was shown by Mr. W. KEMP, Barnes; and Mr. CORBETT, gr. to the Rev. Marquis of NORMANBY, Mulgrave Castle, near Corbett, exhibited fruits and sprays of fruit of *Tomato*, *Royal Sovereign* and *Mulgrave Castle*, both of them of promising character, but hardly distinctive.

In the Veitchian competition for flavour in Apples and Pears, the 1st prize Apple was *Irish Peach*, shown Mr. GEO. WYTHES; 2nd, *Lady Sudeley*, from Mr. HERRIN, Dropmore Gardens. There did not appear to be any award made to the Pears.

EASTBOURNE HORTICULTURAL.

AUGUST 18.—There are few more pleasant summer places than Compton Place, and the enormous attendance on the above date again proved how well it pays to get up a really good exhibition, as was once more the case here. A few of the chief prizes were the following:—

Mr. J. WARREN, gr. to J. OFFER, Esq., Handcross Park, for eight stove and greenhouse plants, showing conspicuous examples of good cultivation. Mr. T. PORTNELL, gr. to Sir A. LAMB, Battle, was 2nd in that class, but beat Mr. WARREN in a class for six similar plants. The eight exotic Ferns from Mr. WARREN were grand. Mr. J. WARREN was ahead of Mr. PORTNELL for eight and also for six ornamental or variegated foliage plants; particularly well-coloured were his *Crotons Sunset* and *triumphans*.

One of the best classes was for groups of Ferns, Mr. A. McBean, gr. to Miss WRAGGE, Braemar, just beating Mr. T. Fuller, gr. to J. HOOKER, Esq., Arundel Road. Mr. WARREN was ahead for six table plants; and Mr. T. PORTNELL for some well-grown pyramidal *Fuchsias*.

FRUIT was very good, especially the Grapes, eight competing in the class for three bunches of any black variety; Mr. T. Tugwell, gr. to Miss SWIFT, Beechwood, winning with well-finished *Black Hambro*, and again for three of any white variety with *Muscat of Alexandria*; a magnificent bunch of *Black Hambro* securing 1st for him in a class for a single bunch, any variety.

The best collection of fruit came from Mr. W. F. THOMAS, Wannock, Polegate, who was also ahead for a collection grown outdoors.

CUT FLOWERS.—Mr. WARREN was in front of Mr. PORTNELL for twelve varieties of stove and greenhouse cut flowers. The best thirty-six cut Roses came from Mr. WILL TAYLOR, Hampstead. R. E. WEST, Esq., Wray Park, Reigate, won for twenty-four and twelve blooms distinct.

Seven competed in the class for three stands of flowers, Mrs. SHERRARD, Hallsam, winning with a very pretty arrangement.

VEGETABLES were very good.

Some of the numerous non-competitive exhibits in one from Messrs. J. CHAL & SONS, Crawley, who had good stands of Cactus, Pompon, and other Dahlias, did Mr. J. CHARLTON, Tunbridge Wells, in addition to stand of herbaceous cut flowers. A superb group came Mr. H. MAY, Compton Place, and from Messrs. G. SCOTT, Eastbourne. Fruit was well shown by Mr. THOMAS, Wannock, Polegate.

TROWBRIDGE HORTICULTURAL.

AUGUST 18.—The Trowbridge Society, which can be one of the oldest horticultural societies in existence, celebrated its forty-eighth annual show on the above date, a society which proceeds pretty much upon the same lines did thirty years ago; it always brings together a large attractive show, and we thought this the best we have seen there. Several large tents were set up in the field near the railway station, and every one of the fully occupied. There were, as usual, *Fuchsias*, the which can be seen only in the Trowbridge district many of the flowering and foliage plants compare favourably with other exhibitions in the West. Rare two such fine collections of nine stove and greenhouse been staged in the West; in the sixes and threes also were well-finished examples. Cut flowers were abundant and very good. There was capital fruit, large quantities of superb vegetables, while the plants shown by workers would have done credit to the best exhibition held in the country.

PLANTS.—Mr. MATTHEWS, gr. to Sir W. R. BROWN, Trowbridge, a young gardener of great promise as a cultivator, was placed 1st with nine stove and greenhouse plants, a well-balanced collection. Mr. GEORGE TUCKER, who has succeeded to the plants he grew as his late employer, Major W. P. CLARK, was 2nd. The exhibitors were bracketed equal 1sts with six plants, did they come to each other in size and finish.

Mr. TUCKER was 1st with three admirable specimen first prize specimen plant was a piece of *Cycas revoluta* Mr. S. AGAR, gr. to Mrs. MACKAY, Trowbridge. The new or rare plant was a finely-coloured specimen of *Alphitoea* Gem, from Mr. G. PYM, gr. to Mrs. GOULD, Trowbridge.

The old reputation Trowbridge has for *Fuchsias* was maintained by Mr. TUCKER, who was first with six, with four plants, and the practice of showing a number of light and dark varieties is a good one. One best dark varieties for exhibition because such a good, and so free of bloom is *Dod's Favourite*, which was raised in this neighbourhood seventeen years ago; it is always a six exhibition varieties.

Such things as good *Cockscombs*; finely grown flowered specimen *mal Pelargoniums*, especially the Mr. TUCKER; *Begonias* single and double flowered, mones, well-grown and bloomed, *Gloxinias*, &c., in the flowering plants, with the exception of those few groups. Groups arranged for effect are a new introduction at Trowbridge, and they are taking well; there are classes for them, but in the most important Mr. G. was 1st with a worthy object lesson in artistic group will not be lost upon the gardeners present at the show.

Mr. R. FOSBROOKE, gr. to R. MOULTON, Esq., Bradfield, Avon, was 1st in the next most important class for a group of plants.

Mr. H. MATTHEWS had the best eight fine-foliated fine *Palms* and brilliant *Crotons*, with a good example of *Phormium tenax variegatum* being prominent. E. S. COLE & SONS, Nurserymen, Bath, were 2nd, were good bushes of *Coleus*, also good *Caladiums*, all sixes; and there was a fine bank of *Ferns* and mosses being shown in groups of fifteen; but on this occasion were too much crowded to display themselves to advantage. Mr. G. TUCKER had the best collection.

CUT FLOWERS included *Roses*, and they were very good for the time of year. In these classes Mr. J. MATTHEWS, seryman, Oxford, had it his own way, for he was 1st in the class for twelve varieties, and with 24 *Tea-scented* varieties, all being clean, fresh, and the main of the 2nd prizes went to Mr. THOMAS, Lower Easton, Bristol, an old amateur cultivator of years' standing. *Dahlias* were numerous, and of good quality for the coming competition at the Crystal Palace.

KEYNES & CO., Salisbury, had the best 24 and also the 12 bunches of Cactus. Messrs. J. CRAY & CO., Froxton, were 2nd. Mr. J. WALKER, Thame, the best 12 *Pansies* also the best 12 *Pompons*. Of seedling *Dahlias* there were very pretty pale lilac Cactus variety from Mr. G. HUNTER, which is full of promise.

Then there were classes for 24 bunches of cut flowers, which the usual stove and greenhouse subjects were present, *Zonal Pelargoniums*, very good and bright, and *Victoria Asters*, and the delicate quilled *Pansies*, *Carnations*, *Hollyhocks*, &c. *Verbenas* in state are still invited, but it is time they were displaced by Sweet Peas.

FRUIT is always good at Trowbridge, and it was so on this occasion. The only collection of ten dishes came from Mr. STRICKELL, a very good one. Mr. G. PYM had the dishes, staging in excellent character *Black Hambro*, *Foster's Seedling Grapes*, *Victoria Nectarine*, 1st *Peach*, *Pears* and *Melons*.

A Diamond Jubilee Class was originated for eight bunches of Grapes. Mr. Carpenter, gr. to A. R. BAILEY, Esq., Frome, was 1st with Muscat of Alexandria, Alicante, Madresfield Court, and Gros Maroc, having enough of each to make up the required quantity. Mr. FOSTER, Bath, was 2nd, having very good bunches of Muscat of Alexandria, this being his only variety. Mr. FOSTER had the best two bunches of black Grapes, staging good Alicante; Mr. T. Smith, gr. to the Bishop of Salisbury, had the two best bunches of white in Foster's Seedling; Mr. CLACK, grower to C. E. COLSTON, Esq., Devizes, the two best bunches of black Muscats in Madresfield Court; and Mr. CARPENTER the best two bunches of white Muscats in that of Alexandria. Barrington and Sea Bight were the best Peaches; Pine Apple and Royal the best Nectarines; Oullins' Golden Gage and Pond's the best Plums; Beauty of Bath, Irish Peach, and Quarrenden the best dessert Apples; Lord Suffield, Peasegood's Nonsuch, and Warner's King the best culinary varieties. A very fine lot of Nuts and Filberts were staged also, and grand Morello Cherries.

Of VEGETABLES there was an enormous display, and generally of remarkably good quality.

MISCELLANEOUS EXHIBITS comprised a charming collection of Garden Roses, from Messrs. G. COOLIDGE & SONS, Bath.

ROYAL HORTICULTURAL OF ABERDEEN.

AUGUST, 19, 20, 21.—This society held its annual show on the above dates in the grounds of Robert Gordon's College, Aberdeen. Naturally, the recent wet weather has injured the flowers, and the show suffered somewhat in the cut-flower sections. This was more than compensated for, however, in the magnificent display of greenhouse plants. Indeed, judges who have attended the show for the past twenty-eight years, declared that they have never seen anything finer in this department.

The entries this year numbered about 1700, or fully 400 fewer than last year, but the display was a most meritorious one. In all sections there were separate competitions for professional and amateur horticulturists, and in a third department valuable prizes were given for the encouragement of working-men amateurs. The arrangements for the show were admirably carried out by the new Secretary of the Society, Mr. J. B. Bannett.

CUT FLOWERS.—Roses were rather poorly represented, but what there was made a beautiful show. The excellence of the Dahlias and Gladioli was remarkable. A special feature in this tent was the fine display of bedding-plants, shown in bunches and pots on a space not exceeding 2 feet by 1 foot. The competitors showed conspicuous taste, and the Society's Silver Medal was worthily won by Mr. ROBERT KILOH, Woodlands Gardens, Cults, with a splendid collection. The model garden contest also brought out some painstaking and unique designs, and Mr. ALEXANDER DOUGLAS, Middlemuir, Belhelvie, carried premier honours. Mr. DOUGLAS introduced a novelty by placing a miniature fountain in the centre of his exhibit. Although not so numerous as usual, the entries in the competition in bouquets, wreaths, and baskets of flowers were in excellent taste. The principal prizetakers in these competitions were Mr. JOHN ROBERTSON, Ferryhill House, Aberdeen; Mr. ROBERT KILOH, Woodlands, Cults; and Mr. ALEX. BURNS, Jun., New Market Buildings, Aberdeen.

POT PLANTS.—In the large marquee, devoted to the housing of the pot plants, were some splendid specimens. Here, as elsewhere, the entries were somewhat fewer than last year, but the quality was above the average, few, if any, inferior plants being staged. In the centre were placed the larger plants, and also groups of plants arranged for effect, on the ground, in circles of 10 feet diameter.

Mr. John Proctor, gr. to Sir WILLIAM HENDERSON, Devanha House, Aberdeen, carried off the beautiful Silver Tea Service with one of the most unique designs ever seen in Aberdeen. Mr. Proctor's design included Crotons, choice Orchids, Ferns, Cactuses, &c., all finely grouped and rising in pyramidal shape to a handsome Cocco Palm as centrepiece. A new exhibitor at the Aberdeen show, Mr. HUTTON, Usan House, Montrose, took 2nd place in the same competition, with a most tasteful arrangement.

In the class for six specimen stove or greenhouse plants, Mr. PROCTOR again carried the prize, with a splendid assortment. Ferns, Pelargoniums, and Dracaenas were well shown.

In Lilies, Mr. LESLIE, Honeybush, took 1st place, with a grand specimen of *Lilium auratum*, which had as many as thirty-six blooms on one spike. The Society's Silver Medal for the best specimen plant in flower was taken by Mr. JOHN PROCTOR, with a superb *Eucharis*; while Mr. HUTTON, Montrose, took a similar award for the best new plant in flower or foliage with *Helleborus illyria*.

Messrs. W. & D. CROLL, Dundee, and Messrs. W. SMITH & SONS, Aberdeen, made fine displays with Roses. Messrs. Smith had also a splendid collection of herbaceous flowering and other plants. The exhibits of pot plants by amateurs and the working class were accommodated in a portion of the Art Gallery Building, adjoining and entering from the grounds. The section was an excellent one; the side tables containing greenhouse plants were of a very high order. Mr. JOHN SIMPSON, Varvil Bank; Mr. BROWNIE, Ellon; and Mr. GILLIES, Aberdeen, were all to the front as amateur exhibitors.

VEGETABLES.—Although not so numerous as last year, the quality was excellent. Some of the Potatoes had the pre-

vailing fault of the year in not being cleaned skinned. The special feature of the vegetable tent was the boxes of vegetables, which were arranged with unusual taste. The premier collection was sent in by Mr. GEORGE MILNE, Cluny Castle, and was the subject of much comment, professionals declaring it to be the best both in point of quality and taste that has been seen at the Society's show for many years. Market gardeners also came forward strongly in this tent, the winners in a tough fight being Mr. ALEX. PATTERSON, Ruthrieston, Mr. JOHN PATTERSON, Sunnybrae, Rubislaw, and Mr. ALEX. DAVIDSON, Kepplestone, Rubislaw. In the amateur class, the chief winners were Mr. WILLIAM LEITH, Crimonmogate Mills, Lomnay; Mr. W. D. BROWNIE, Ellon; and Mr. CHARLES GRAY, Woodside, Aberdeen.

FRUIT.—The show in this section was very fine, and some uncommonly fine specimens were staged, especially of Grapes. Mr. HUTTON, Montrose, is to be congratulated at the large amount of success he achieved at this his first appearance at an Aberdeen show. He worthily carried off quite a number of prizes in this section. Gooseberries were particularly fine, the chief honours in this section being taken by Mr. MIDDLETON, Monymusk House, and Mr. JAMES GRANT, Crimonmogate. For Grapes, Mr. A. HUTTON, Mr. GEORGE M. STUART, Banff, were the chief prize winners. Among other prominent winners in the fruit section were Mr. ANDREW REID, Durris; GEORGE TAYLOR, Raeden; ALEXANDER REID, Urie House, Stonehaven; DAVID CHAPMAN, Aden House; and JOHN DALGARNO, Elgin.

NON-COMPETITIVE EXHIBITS.

Mention must be made of the beautiful displays made by Messrs. BEN REID & Co., Aberdeen, and Messrs.

FIG. 44.—ELASTIC TUBE FOR PRESERVING FLOWERS IN BUTTON-HOLES.

COCKER, Rosarians, Aberdeen. These displays were indeed superb, and reflected the highest credit on the firms named. Space will not permit of fuller details.

DEVON AND EXETER HORTICULTURAL.

AUGUST 20.—In proverbially unfavourable weather, the 185th exhibition of this society was held on Northernhay Public Grounds. The classes slightly exceeded in number those of last year, but there were fewer exhibitors. As a whole, the exhibition compared favourably with previous ones, the groups and the vegetables indeed showed higher excellence.

Mr. Mairs, gr. to Sir JOHN SHELLEY, Bart. Shobrooke Park, staged a magnificent collection of vegetables, which was one of the features of the show, and Mr. Rowland, gr. to W. BROCK, Esq., Parkerswell, surpassed all previous efforts in his arrangement of plants for decorative effect.

CUT FLOWERS (OPEN).—For twenty-four Double Dahlias, show and fancy, Mr. G. HUMPHRIES, Chippenham, was 1st, and in the twenty-four Double Cactus class, premier honours were awarded to Mr. W. B. SMALE.

The 1st prize for forty-eight spikes of Gladioli went to F. H. FOX, Esq., Wellington, and for twelve Tea Roses to Messrs. JARMAN & Co., Chard.

SPECIMEN PLANTS.—The value of the 1st prize for specimen plants is not enough to tempt exhibitors from a distance, so that the competition is confined, as it were, to local growers. The classes for twelve stove and greenhouse, and for six stove and greenhouse plants—half in flower and half foliage—was taken by Mr. Rowland, gr. to W. BROCK, Esq., as also was that for six stove and greenhouse flowering plants. Mr. Rowland's plants looked wonderfully well.

For six stove and greenhouse Ferns, premier honours fell to Mr. BARNES, gr. to the Rev. A. H. HAMILTON-GELL, Winslade.

GAUDES.—The miscellaneous group, 11 feet x 15 feet, arranged in an oval space for effect, was keenly contested, the cup falling to Mr. ROWLAND, Mr. G. LOCK, gr. to B. H. HILL, Esq., Cleve, Crediton, being a close 2nd. Instead of the old cone shaped arrangement, both competitors had used virgin cork more or less effectively to make an irregular arch from which sprung light arrangements of Orchids, Grasses, &c.

In the smaller group (11 feet x 8 feet), Mr. BAWDEN, gr. to W. D. RICHARDS, Esq., Beaumont House, Broadclyst, won.

FRUIT.—In the Fruit classes, the chief prize is given by the President for the year, Mr. Alderman POPPLE, Mayor of Exeter, and for this prize the competition was keen, premier place being given to Mr. LLOYD, gr. to V. BRUCKER, Esq., Langport. Mr. LLOYD's collection consisted of Black Hamburgh and Muscat of Alexandria Grapes, Queen Pine, Jargonelle Pears, Pineapple Nectarine, Jefferson's Plum, Brown Turkey Fig, Dymond Peach, Melon Taunton Hero, Quarrenden Apples.

VEGETABLES.—For the collection of twelve kinds there is always much competition, but though all three entries were well staged, Mr. Mairs, gr. to Sir JOHN SHELLEY, was well 1st, and Mr. LOCK was 2nd. In the separate dish classes for vegetables the competition was keen, the entries numerous, and the quality exceptionally high.

The classes for cut flowers filled well, and competition was close.

A collection of plants was staged by the Jadoo Co.; these were growing in Jadoo Fibre. They were bright in colour, healthy and vigorous.

HONORARY EXHIBITS.—Mr. Slade, gr. to Lord POLTIMORE, Poltimore Park, staged a grand lot of *Streptocarpus*, well-grown and full of highly-coloured blossoms, some very fine *Cannas*, *Lilium auratum*, and other plants.

Messrs. ROBERT VITCH & SON, Exeter, showed choice Alpines, *Cannas*, Gladioli, Dahlias, and a charming lot of the new brightly-coloured hardy *Nymphs* floating in water. The EXETER NURSERY Co. staged a fine collection of stove and greenhouse plants; Mr. JAMES WALTERS, Mount Radford, Roses (conspicuous among which was a box of fine blooms of Mrs. John Laing); Messrs. JARMAN & Co., Chard, Double Begonias, Roses, and Dahlias; Mr. WILLIAM RANDALL, Exeter, a general collection of conservatory plants; Mr. W. B. SMALE, Torquay, Dahlias; Messrs. TUPLIN & SONS, Newton Abbot, Carnations.

NEW INVENTION.

FLOWER-TUBE FOR THE BUTTON-HOLE.

MR. SOOTT, of Kirkgate, Leeds, sends us a specimen of a flower-tube for the button-hole which is efficient, inconspicuous, and inexpensive. It is made of india-rubber, and the disc is so inclined at the upper part, as to rest against the lapel of the coat. It is made solid at the point so as to prevent the water being ejected if the tube get pinched. From its elastic nature, the tube adjusts itself to the curve of the coat, and does not project beyond it.

MARKETS.

COVENT GARDEN, AUGUST 26.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

MUSTARD FOR WIRE-WORM.—I should be very glad if any information regarding Mustard for destroying wire-worms, as advertised in the *Gardeners' Chronicle* for March 6, 1897. How much of the Mustard dress should I use per acre? Also, how much Mustard-powder should be mixed in 4 gallons of water for eradicating worms in pots? *Inquisitive*.

WEED-DESTROYER.—What are the proper quantities of arsenic (poison!), potash, and water, to boil together for destroying weeds on gravel paths, how long should they boil, and what is the correct strength to use liquid at? *Dulwich*.

WATER WEED.—What are the best means of destroying Potamogeton and other such weeds from a lake? *Leaden*.

FIELD MICE.—What is the best method of ridding a lawn of field-mice? They do not appear to take the poisons put down for them. *E. R.*

NOTICES TO CORRESPONDENTS.

BEGONIAS: F. W. The work of a mite, extremely minute in size. Try tobacco-water.

BOOKS: H. G. R. *Vegetable Teratology* (Masters) is out of print. You may possibly obtain a copy from a secondhand bookseller.—*Smith*. (1) *Diseases of Plants induced by Cryptogamic Parasites*, by T. B. T. Smith, translated by W. G. Smith (Longmans, Green & Co.). (2) *Manual of Injurious Insects, and Methods of Prevention*, 2nd edition, by E. A. Ormerod (Simpkin, Marshall, Hamilton, Kent & Co., Ltd.).

BULBS: Ignoramus.—The Frezias should be cultivated in pots in the greenhouse, and may be potted up now. The Narcissus may be put in the ground at once, or any convenient time until end of October. Oxalis rosea will thrive well in a good situation out of doors. Nerine sarniensis had best be potted up for cultivation in the greenhouse. Zephyranthes rosea may succeed in a specially sheltered spot out of doors, but the species prefers greenhouse treatment. Cooperia Drummondii is also tender, but it succeeds in exceptional positions out of doors.

CARNATIONS: O. W. D., and L. G., Malden. Macrosporium nobile, a well-known Carnation pest, is present on all the specimens sent, and is undoubtedly the cause of the trouble. The presence of this fungus is indicated by an arrest of growth of the internodes, resulting in densely crowded and stunted branches. All fragments of diseased plants should be collected and burned, and the healthy plants sprayed with potassium sulphide, to guard against inoculation from the innumerable spores present on diseased plants. *G. M.*—*Enquirer*. Write to Mr. J. Douglas, Edenside Nurseries, Bookham, Surrey.

CHRYSANTHEMUM: G. H. You send a very curious condition in the variety Robert Flowerday, in which the internodes or joints of the stem are much contracted, and the leaves crisped and contorted. It is clearly due to some check to growth, but how caused we cannot tell. It appears, according to your statement, to affect all the plants of that particular variety, and no other.

EXAMINATION BOOKS: W. S. Put not your trust in books alone, but get a few weeks' or, better, months' practical training if possible. As aids, you will find Dr. Sorauer's *Treatise on the Physiology of Plants* (Longmans), very serviceable. If that is too large, then try F. Darwin's *Elements of Botany* (F. Clay & Co.).

GLADIOLI: W. P. The safest and best practice to consistently follow is to lift them each season. Of course most of them are hardy enough to be left in the ground in this district, without suffering injury in an ordinary season. But excessive damp is prejudicial to them, and as a general practice we would advise you to lift and store them as you would Tulips.

GRAPES: S. E. D.—A very curious state of things in which the seedcoats become fleshy and grow faster than the berry which, in consequence, cracks. We usually do not see Grapes in this condition till they are ripe, when the appearance is that of one

or more Grapes arising from the interior of the parent Grape, and so the condition was described and figured. Your specimens show that it is the seeds that become fleshy; we cannot assign any reason for the change.

HORTICULTURE IN MALTA, MADRIRA, AND CANARY ISLANDS: Christian Schmidt. We cannot advise you of any in Malta or Madeira, but you might communicate with the following persons in Las Palmas, Canary Islands:—Victor Perez, Rafael Massuer, Felipe Massuer, and Juan Leon, of Castillo.

NAMES OF FRUITS: C. S. Your Apple is identical with Catahead.—*A. J. B.* Your Peaches were too badly bruised to be identified, which under the most favourable conditions is difficult in the case of Peaches removed from the tree. Plum No. 3 is Lawson's Golden Gage, and No. 4, Guthrie's Late Green Gage. We do not know what caterpillar it may be that is doing the mischief.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—*J. H., Kilkenny*. The common Truffle, Tuber aestivum.—*E. A.* The leaves are of the Japanese variety of the common Hop.—*E. S. R.* 1, Clematis viticella; 2, Clematis flammula; 3, Spiraea Douglasi; 4, Lycium barbarum; 5, Picea orientalis; 6, apparently one of the American Oaks—perhaps Quercus coccinea; 7, a Silphium, which we do not recognise; 8, Thalictrum flavum. Thank you for sending such good specimens, but another time please not to send more than six at a time.—*Subscriber*. Valletta purpurea.—*D. P. Mansell*. Another time send to the Editor, not to the Publisher. Your plant is Alonsonia incisa.—*A. H.* Some Zinsiberaceous plant, but which we cannot determine from such meagre leaf specimens.—*T. W.* 1, Stachys lanata; 2, N. 4 recognised; 3, Perhaps the Atlas Cedar. We cannot tell from the piece sent; 4, Viburnum Lantana.

NURSERY FOREMAN: S. T. C. As you were paid weekly and had no agreement, we do not think you can claim a month's notice.

PRIMULA JAPONICA: C. W. D.—The flower stalk, instead of withering, has developed a leaf-bud from its side, as happens occasionally in herbaceous perennials.

RAINFALL: Hydro. .07—1.32—4.11—1.06 and .901.

THE CAPE OR UNITED STATES: W. F. C. We are not sufficiently acquainted with the circumstances to be in a position to advise you. If you emigrate to either place, you should be prepared to turn your hand to anything—for a time, at least.

TOMATOS: A. W. Pollard. The normal number of carpels is 2 to 5. In these specimens, instead of remaining united, some have become detached.

TOMATO A FRUIT OR A VEGETABLE.—From a botanical standpoint, of course, the Tomato is a perfect fruit, just as a Peach is, or a Kidney-bean pod. At the same time, as Tomatos are almost exclusively (though not invariably) used as a vegetable, and with salad, it is found convenient to class them with vegetables, and thus to call them what they are not.

VALLOTAS: Subscriber. See note under "Plants under Glass" on p. 125 of our last issue.

COMMUNICATIONS RECEIVED.—W. O.—G. S. B.—J. A.—H. E.—W. G. S., Edinburgh—J. McL.—N. E.—Br.—G. A. R.—W. T.—J. D.—J. B.—J. D. S. C. de B.—J. R.—Director, Royal Gardens, Kew.—J. C.—J. H.—C. W. D.—W. S. CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—The Publisher has the pleasure of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED, and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 4, 1897.

THE PARISIAN FIG CULTURE.

THE raising of Figs in the vicinity of Paris is increasing, proof that the industry is remunerative. While in the East the Fig-tree acquires large dimensions, round Paris it is but a shrub. The Fig belongs to a family claiming to have 600 species, that are not easy to class. The ordinary Fig, *Ficus Carica*, is peculiar to the regions of the Mediterranean, where it produces an abundant supply of esteemed food. The tree may be said to grow there spontaneously, and to attain a height of 33 feet. The Sycamore, or Pharaoh Fig, *Ficus Sycomorus*, is peculiar to Egypt and the Levant. It grows to a very large size; its fruit, which is not much prized, is extensively consumed by the Arabs, and its light wood, reputed to be incorruptible, formed the coffins for mummies, and has proved to be well conserved. In Abyssinia the Fig is made into bread, hence the *F. panificus*. The *F. religiosa* produces gum lac, the *F. rubiginosa* yields caoutchouc, or india-rubber; the juice of *F. atrox* supplies Indians with poison for their arrows, *F. variegata* furnishes the vegetable wax of Sumatra, and *F. elastica* is cultivated as an ornamental shrub in Europe.

Only two varieties of Figs are grown in the vicinity of Paris—the Versailles or Madeleine, and the Dauphine. The chief *figueries* are at Argenteuil and La Frette—the latter is famous for its Lilac also. Figs are found in Western Asia, Northern India, Northern Africa, Burmah, Malaya, and Southern Europe. Naturally, its culture exacts great care at Paris during the winter. In winters of great severity that part of the plant above ground is killed, but so long as the frost does not touch the roots, new shoots will be sent up, for the shrub grows rapidly, and is, on the whole, not exacting as regards soil. The Fig prefers a light soil, where sand predominates; an argilocalcareous soil is good, but some varieties thrive well even on humid land, or land that can be irrigated. The main point is to secure a southern aspect, and to protect the plant from the too dry winds in spring, and from those too humid in autumn. It is not averse to poor soils, but those fresh, deep, and fertile suit best. Round Paris such favourable conditions exist. The chief mode of propagation is that from *marcottes* or layers, raised from two-year-old branches, and easily effected, as they rapidly take root. In March they are separated, and planted out. The plant is also propagated from slips, suckers, and grafts, but rarely from seed. The latter, in the South of France, is rather an amusement than a serious business; the seed is uncertain and tedious. Suckers have a tendency to produce suckers. The end ought to be to secure a bush, called

cépée, with five or six stems, from 3 to 7 feet high. In April, the soil having been well prepared, the layers are planted in trenches 21 inches apart, and the same width. Place the layers so as to slope alternately to the right and left, at 12 feet apart; the distance between the trenches varies from 13 to 16 feet. In due course prune, so as to secure vigour for the stems, which will bear fruit from the third year. The bearing branches must not be too numerous. Pinch off useless buds, but leave sufficient for the development of new bearing wood, and leaves to shade the fruit. In the vicinity of the latter, nip off unnecessary buds; this will prevent the Figs from becoming stunted and leathery. The leaves supply shade and mellow the fruits; but if too many, and they rub each other, thin out, as they might in their rubbing scratch and blacken the Figs.

In the South of France, the Fig-tree produces two crops in the year—spring and autumn; however, in the *figueries* of Paris only one crop is raised, that between the end of June and August. In order to hasten the maturity of the Figs, a drop of the best olive-oil from a pointed bit of wood or a quill on the eye of the Fig. This swells the latter, and hastens maturity by seven or ten days, but unless executed by an experienced hand, when the fruit commences to assume a blond tint, which indicates ripeness, the flavour may suffer. For the Paris market the Figs, generally six on each branch, and weighing from 2 to 4 oz. each (I have before me at my *déjeuner* four green and purple varieties of a total weight of 10 oz.), are gathered in the morning before the dew has disappeared. Of course, only green Figs are raised around the capital. Marseilles sends also plenty of fresh Figs during her season, which commences in August; this Provence Fig is small, soft, has an agreeable perfume, and makes an exquisite table fruit. In Smyrna the Figs, when half-dried, are flattened, then placed in sacks in an airy situation, or packed in cases for exportation. The small Figs of Dalmatia and of the Greek Islands are exported in large, rush-woven sack baskets.

Examine the young branch of a Fig-tree in course of elongation: in the axil of each of its leaves is a bud or eye more or less pointed, and accompanied by a small globular body, which is the Fig in its embryonic stage. In due time it develops, till it resembles a little Pear, inclosing in its concavity a large number of grains that are the result of the fecundation of as many female flowers. The Fig contains 11 per cent. of sugar, so more therefore than the Apple or Pear. It is one of the four fruits which, with Grapes, Peaches, and Strawberries, constitute part of the alimentary régime for complaints of the stomach.

How do the Fig-growers round Paris fight the climatic difficulty? About the middle of November, when the leaves drop, and of course the fruit is all gathered, a trench is opened and the stems inclined therein, but so as not to touch; all extraneous vegetable matter is excluded, as its presence could induce decomposition. The stems are next covered with a good 12 inches of the excavated soil, battered down, and sloped from the top like a roof, to throw off the rain. This wintering operation is performed during dry weather. In March, when no severe frosts are to be apprehended, the trenches are opened during foggy weather, so that the soft and humid stems are not too suddenly exposed to sunshine, or to too parching air, and the plant injured thereby. Then level the soil, dig, and weed, and open at the base of

each bush a basin to receive water when deemed necessary.

The Fig plant is only liable to one insect, attacks from the *kermes coccus*. Like all the species of this family, the parasite lives on the sap, causing the leaves to curl up, and the fruit to fall. Scraping the branches with a blunt knife, or rubbing with a rough brush dipped in a solution of soap-and-water, or dusting with flowers-of-sulphur, will get rid of the pest. The price of green Figs in Paris varies from 2 to 5 francs per dozen. *Edward Conner.*

NEW OR NOTEWORTHY PLANTS.

SOLANUM LASIOPHYLLUM, *Dun., in Poir. Encyc., Supp. III., p. 764.*

THIS is a woolly spinous species, much in the style of *Solanum marginatum*, but with purple flowers. Although not in any way remarkable on account of its fruit, the contrast of white woolly leaf and purple flower is very effective; and should the plant prove easily manageable in cultivation, it will probably secure a permanent foothold.

The species is Western Australian, and it ranges from the tropics into the desert, but is not found in the moister south-west corner of the colony. Seeds brought down by myself from the interior readily germinated in the conservatory of a relative, and, thanks to the care of Mr. Stacey, the gardener, flowering began in the second week of August. The seedlings were raised in sandy loam, whence they were transferred to leaf-mould, which suits them admirably, provided it be not watered too freely. In its native haunts, which are sand-patches near granite outcrops, it seeds freely; in the desert, however, it rarely exceeds half a foot or so in height, whereas cultivated specimens are twice as high. *Spencer Moore.*

ORCHID NOTES AND GLEANINGS.

ALDERMAN WILLIAM BOLTON'S ORCHIDS, WILDERSPOOL.

MR. BOLTON in the course of the last few years has erected in an open quarter at the back of his villa residence about thirty span-roofed houses for Orchids, for the purpose of making the crop of flowers pay, as well as for trade and general purposes, and, so far as one can see, he has been fairly successful, with Mr. Cain as his general cultural manager. He has commissioned Mr. Jensen to send him from the rich stores of Pacho the best forms of *Odontoglossum crispum*. He must have quite 50,000 *O. crispum* alone, varying in size and established condition. His houses are low-spans, more than 100 feet in length, and the pitch of the roof is so contrived that lines upon lines of these established plants, closely, but not too closely, set, weigh down the roof-covering. They are mostly grown in perforated pans, and the atmosphere is kept very moist; the result is, that the young growths have great vigour, and the matured bulb, after the trying ordeal of transport, are plumping-up. He has also a more advanced batch, sent home by Carder, to which he attaches great importance, and a large parcel of what might be called a nondescript lot, very vigorous, but of lesser merit. The plants of *O. Pescatorei* are in fair quantity, and contain many fine blotched and spotted flowers. There are also other species, but not of the same commercial value. This batch, in bulk, good and indifferent, will occupy about ten of the low span houses.

In other houses, all of the low-roofed type, are quantities of *Cattleya*. The varied collection of plants of *C. labiata* are sending up young growths with sheaths that promise a plentiful crop in autumn and winter. They are kept in pots of limited size, and the roots clamber over the sides, indicating vigour in the same plane as the deep green leaves with their sheaths both double and single. In these low houses, the sun-beat is tempered by copious

moisture, which, in the height of the growing season, can scarcely be overdone.

There is a grand stock of *Cattleya Trianaei*, which is largely sold in this establishment, both as plants and as cut-flowers for market-purposes. Some of the varieties are very durable, and find their way not to shops only round about here, but in Covent Garden. The low roofs suit this *Cattleya* well, and the grand sheaths, bronzing as they mature, give indication of vigorous flowers. *C. Mossii* is filling up again, and from the various quarters that it comes from give great variety. As it is one of the oldest, so is it one of the best for varieties in colour, varying from light or whitish to intense cerise colouring. Undoubtedly the most popular *Cattleya* we have is *Cattleya Mendeli*. It had its rise in the Manchester district, and was dedicated to Sam. Mendel, who resided in the Whalley Range district. There is a grand batch in several houses here—all about the same elevation—rubbing leaves, so to speak, within a safe distance of the glass-roof. Of course, a three years' culture of imported plants is not a sufficient test of the life of a plant, as we have had many opportunities of witnessing—a long life of an Orchid betokens cultural capacity. It makes a pretty plant, this *C. Mendeli*, when properly handled. Its home has been evidently run-racked, and it behoves all growers to take good care of their plants. What a beautiful thing *Cattleya gigas* is! After seeing Warner's *Select Orchidaceous Plants*, 1st number, we cannot think of calling it *Warcewiczii*! There is evidently a free-flowering strain of it, as observed in the numerous forms in flower here. Then *Cattleya aurea* is not scarce, but we can take all that arrive. The cut flowers of this species fetch higher prices than those of any other *Cattleya* or anything else. There is a nice batch here, and there is a proper way of growing it: suspended it must be and near the glass, if health, life, and good condition are to be maintained. What a lovely-coloured species *Cattleya superba* is! We are evidently learning the way of growing it. It is in fine health and flowering freely in this establishment. The best group we ever saw, both as to growth and flower, was in Mr. Rappart's establishment not far from West Brighton, Liverpool.

Mr. Cain tells me it should not be grown in a highly-heated atmosphere, but that it should be placed towards the glass, and not stunted, particularly atmospherically, of moisture. It is in fine flower, and coming at this season of the year, its brilliant carmine flowers are indispensable where the best things only are wanted. Another capital July and August flowering-plant is *Cattleya Harrisoniana*, the variety of shades of colour, and the size of the individual flower being striking. *Cattleya Gaskelliana* varies as much as does any *Cattleya*, and cannot always be depended upon to come uniformly good year after year; its fragrance is delightful. Another good distinct *Cattleya* is *C. Schilleriana*; the dusky blotches and spots remind one of Oriental colours, and fine plants of it are now cheap in the market. The summer-flowering *C. labiata* Warneri is a very distinct grower, and its flowering season is generally finished before the "old" *C. labiata* comes in. The stock here was much increased last season, and the collectors have sent over good-sized plants of it. It is easily known by the leathery texture of its leaves, and the eyes at the base of the growths being very prominent—more so even than the form which was so much prized, and which for over twenty years was lost, until collectors met with it on fresh ground. *J. A.*

KEW NOTES.

CALCEOLARIA ALBA, figured in a recent issue, is now in flower in an outside border by the wall of the Orchid House at Kew.

Capparis spinosa.—The Caper is not always found an easy plant to grow. There is just now a fine plant in flower in an outside border at the base of the wall of the Economic House at Kew.

Polygonum lanigerum.—This forms a very attractive bed at Kew. It is a perennial, growing 3 to 4 feet in height, with bold handsome foliage, the leaves being lanceolate, somewhat decurved, and covered with hoary down. The plant is a native of the tropics, and will probably not survive the winter without protection; grown as it is at Kew, it forms one of the most effective plants we know.

Echinops albidus is an old, rather than a well-known plant. The foliage, though spiny, is elegantly cut, and of a grey colour, whilst the globular flower-heads are whitish.

Rudbeckia maxima is a perennial now in flower at Kew. It has bold ovate entire glaucous foliage, which alone is striking. The large flower-heads are yellow.

Ipomoea versicolor.—Under this name is to be called in future the pretty climber with one-sided spikes of yellow and red flowers, known as *Mina lobata*. It is now in flower in the herbaceous ground at Kew.

Polygonum baldschuanicum.—There is no question as to the beauty of this species as now seen in the herbaceous ground at Kew, but it is stated to be difficult of propagation.

TRINITY GROVE, EDINBURGH.

SOME four years since your late contributor, "Vagabond," whose promising career was all too short for his friends and our literature, visited the Grove, and chronicled some of the historical incidents and horticultural features of these gardens, mellowed with many memories of the past, and distinguished by many merits of the present. I will proceed to describe a few more of the more prominent features of this exceptionally well-managed and fully-furnished place. The entire area covers some 6 acres, and is surrounded on three sides by walls of considerable height and strength. Those are needful for safety, as well as for shelter, as the demesne is environed by public roads. The Firth of Forth also approaches within a few yards, and the east winds especially roll across the gardens with terrific force, sweeping the heads of the Cedars and other Conifers with such violence as to prevent them from reaching their full stature. At one corner of the ground the house approaches close to, and may be said to form the boundary wall into a yet higher and stronger barrier against the Firth of Forth and the sea breezes. Freezing fogs that often do much harm rise densely, and fall with chilling force over these gardens in the early spring. Similar fogs are more or less constantly hovering over Edinburgh and the surrounding district.

The planners and planters of the grove used every means in their power to build, plant and grow out of their well sheltered garden the scathing winds, the shivery fogs, the bleak, wild inrush of storm and

tempest from the open sea. The oldest, possibly the first, wind and storm-break runs along almost the entire length of the boundary wall facing the Firth. It consists of a high screen of Sycamores, Limes and Ash. These are fine stately trees, with large boles and tops, though they have boldly done battle with the breeze rolling in from the Firth for probably a hundred or more years. There are other stately trees towards the end of the house, as well as the fine Pear and Poplar trees, and others. The Pear is immensely prolific, but specially perishable, so that they must be bottled or preserved, or eaten—no easy matter with such quantities—so soon as ripe, though it has set thinly this year. At other points, shelters of Yew, Privet, Holly, and other trees or shrubs in hedges are used with excellent effect to improve the local climate of well-furnished rosaries and kitchen gardens. Thriving masses of young trees and shrubs are posted where they will prove most effective for shelter, and telling for landscape effects. It is astonishing what cosiness, shelter, variety, and rest may be had out of such gardens as these skilfully laid out and carefully furnished. If once inside, their well-clothed walls of flowers, climbers, fruit trees, &c., their many walks, numerous flower-beds and borders, various grass- and tennis-lawns, make one soon forget his close proximity to the city, the road, and the sea. The long walk, nearly 200 yards long, partly shutting out and partially revealing the kitchen garden, and melting as it were, into the orchard, beget ideas of extent seldom found outside of the largest gardens. The standard Hollies and Rhododendrons of great size and in robust health, the latter in full flower, sufficed to fill the eye and senses with pleasure.

One of the most pleasing charms of the grove is that the beauty of the gardens unfolds itself gradually. The hedge-screens, the groups of trees and shrubs, partly reveal and partially conceal the fire beds and borders of herbaceous plants. The somewhat unique and almost quaint group of glass-houses are the same as those already described. Mr. McKenzie does not exhibit, and therefore he has few new plants or new houses; but the old houses are fully and well furnished. I noticed a fine plant of *Cleodendron Balfourianum* in full bloom, and some good pieces of *Dendrobium nobile* and other Orchids in robust health.

Ferns were also in full beauty. The *Lapageria rosea* was growing like a weed on one of the walls; and the finest and most persistent bloomer of all the Passion-flowers, *P. racemosa*, was a blaze of colour on the flowering racemes from the last year's wood, while the current year's shoots were rushing into bloom. This is without an exception the finest plant of this splendid Passion-flower ever seen by the writer. When, as an old and successful grower of this plant, I ventured to advise him to leave all the old racemes intact, as they would assuredly bloom again after a short rest, a look of incredulity passed over his face, as if he doubted whether he could find room for more bloom than he had already. And probably he was right.

In a small Peach-house and viney at the end of the plant-houses Mr. McKenzie had managed to pack more Peaches, Nectarines, Grapes, upon four stone-fruit trees, and on a few rods of Vines, than is sometimes seen in half-a-dozen glass-houses of four times the size. On venturing to suggest whether he might not be overloading his willing horses, that is, Vines, &c., he cheerfully replied that he thought this the lightest crop he had had, adding, as he proudly and tenderly touched leaf and fruit, "You see how they seem to like it." And assuredly the fine foliage and plump fat buds were models of vigorous health, as much as the crops were of unusual fertility.

The Peaches were Royal George, Violette Hâtive, the Nectarines also, I believe, is Violette Hâtive. The Grapes were Hamburgs, Muscat of Alexandria, and Madresfield Court. In answer to an enquiry as to the latter's conduct as regards cracking, the answer was an emphatic, "No; the heavy crop prevents that!"

The fruit crops in the open were good; Gooseberries especially were giants in vigour, pictures of

at the fruit thinner than usual, owing to biting winds and severe frost of the spring. also thin this season. Plums and Cherries much grown, and Apples still promise a crop; Strawberries were fine, but nearly a year than last year. Early Cauliflowers, peas, and all other vegetables promised well. into a summer-house on the Lawn, we saw capital oil-paintings on the panels of Niel Roses, Constance Eliot Passion-flower, Roses, &c., painted by Miss Thomson, sister of A. Thomson, Esq., the proprietor *ve. D. T. F.*

the arborescent species of North America, for, although it extends over a large area, it is nowhere abundant. This species breaks down the distinctions that were once made to keep the *Pavia* and *Æsculus* separate. It has the characteristic flowers of *Pavia*, but the fruit is prickly when young like the true Horse-Chestnut, and at the same time has the thin valves of the *Pavia*. The flowers resemble those of some forms of *Æ. flava* in colour, but always differ in the long exerted stamens. Another difference in our comparatively small cultivated specimens is to be noted in the bark, that of *Æ. glabra* being rougher and more fissured than in the other.

flowering tree. No tree of its size produces a more beautiful display of flower, or has more striking foliage. It reaches normally 50 to 80 feet in height, but often more. At Invercauld House, in Aberdeenshire, there is a tree which a few years ago was close on 110 feet high. It is seen in greatest beauty when planted as an isolated tree, or in a group six or eight together. In either case, it requires ample space, so that the lower branches may spread out and sweep the ground. The magnificent avenue of Horse-Chestnuts in Bu-hay Park forming the approach to Hampton Court Gardens is famous throughout the country. It is essentially a tree for the park, the

FIG. 45.—VIEW IN THE PUBLIC PARK, WORTHING, SUSSEX. (SEE P. 403, IN OUR ISSUE FOR JUNE 19 LAST.)

HORSE-CHESTNUT AND ITS ALLIES.

(Continued from p. 130.)

BRA (OHIO BUCKEYE).—This is one of the active of the genus, having small racemes of yellow flowers. The leaf has five, six, leaflets, which are obovate, and have a mid-rib and main veins. The name is somewhat of a misnomer, for the leaves are occasionally covered underneath with a pubescence, and it is always present on the mid-rib and in the axils of the veins; however, is never so pubescent as that of *lanceolata*. This *Æsculus* is known as the Buckeye (and in gardens sometimes as *Ohioensis*). It is said to be the rarest of

Æ. HIPPOCASTANUM (THE COMMON HORSE-CHESTNUT).

Until quite a recent date, the native country of the Horse-Chestnut was unknown and merely guessed at. Most authorities gave it as North India, and Loudon attributed it to "Asia and North America," a very comprehensive area, but still incorrect. It is now known to be indigenous to the mountains of Northern Greece, where it was noticed by Sibthorp, and where, at a later date it was found by M. Orphanides to be a true native. It seems to have reached the more western countries of Europe by way of Constantinople, seeds having been sent from there to Clusius, the botanist, in Vienna, about the year 1576. Of all the trees hardy in Britain, either native or introduced, the Horse-Chestnut is the finest when regarded as a

timber being of comparatively little value, although clean straight stems are valued for purposes where a soft white wood is required. There are numerous varieties, among which the following may be mentioned:—

Floris-pleno, whose flowers are of longer duration than the type.

Foliis aureis variegatis.—Leaves more or less of a golden-yellow, which, however, tends to gradually disappear as the trees get older.

Laciniata (syn. *asplenifolia*).—A curiosity, the leaves being cut up into narrow lobes.

Memmingeri.—The entire leaf has a yellowish tinge. *Crispa* has short-stalked leaves, and broader leaflets; the whole tree, too, is of compacter habit.

None of the varieties is superior to the type.

Æ. INDICA (INDIAN HORSE-CHESTNUT).

The first recorded flowering of this species in England was in 1858, in the July of which year it flowered with Mr. C. J. Bunbury at Mildenhall in Suffolk. This tree had been raised from seed sent from Northern India about seven years previously. This species has never become common, because it is not so hardy as most of the genus. Its leaflets are more numerous than in the other species here mentioned, seven to nine of them being produced in one leaf. This character, and the fact of the leaflets being produced on a small, flattened, somewhat crescent-shaped expansion of the main petiole, render it easy to be recognised. Each leaflet is stalked, toothed, dark green, and smooth, the middle and largest one 9 to 12 inches long. The young wood and leaf-stalks have a red tinge. The flowers are white, and produced in rather loose racemes 8 inches long; the two upper petals have a blotch of yellow and red at the base, and the lower ones are tinged with pale rose. This Horse-Chestnut is found in Nepal and other parts of Northern India, at elevations of 8000 to 10,000 feet, where it forms a tree 70 feet high, with a trunk one yard in diameter. Sir Joseph Hooker saw it in 1849, during his Himalayan travels, loaded in spring with its white blossoms, and equalling in beauty the common Horse-Chestnut at home. It flowered at Kew during June last.

Æ. PARVIFLORA.

For small gardens this is the most valuable of the genus. Invariably of dwarf stature, it is sometimes a small tree with a short, single trunk (as in the case of the fine specimen in the Coombe Wood nursery), but more often it is a low bush, greater in diameter than in height, and sending up a crowd of stems from beneath the surface of the soil. Its value is the greater also because it flowers in July and August, or some five or six weeks later than the others, and at a time when flowering shrubs are becoming much scarcer. It is seen at its best, perhaps, as an isolated specimen on a lawn. Its leaves are of the common Pavia type, consisting of three to seven, but usually five leaflets, which are in colour of a deep green. The raceme is erect, long and slender, carrying numerous flowers, which are white faintly tinged with pink. The stamens constitute no inconspicuous feature of the flower, being long and thread-like, and pinkish-white. In spite of its beauty, both as regards foliage and blossom, not to mention its graceful habit, it is a shrub that has been much neglected; yet it has been in cultivation since 1820. It is a native of the South-Eastern United States, and is met with in gardens under the name *Æ. macrostachya*.

Æ. PAVIA (RED BUCKEYE).

This is a dwarf species, most frequently a shrub, but occasionally a small tree. The leaflets are five in number, lanceolate, 3 to 5 inches long, serrate, shining dark green above, paler, and covered with a fine pubescence beneath. The flowers are disposed in short erect racemes, and are of a bright rosy-scarlet, with red protruding stamens. From *Æ. flava* and *glabra* it may be distinguished by its smaller leaves and its more bushy and less vigorous habit. It is, like them, a native of the Eastern United States. There is a form with pendulous branches (*pendula*); both it and the type are suited to positions of limited extent.

Æ. TURBINATA.

In habit and in foliage, this Japanese species very closely resembles the common Horse-Chestnut, but the fruit is quite smooth, which is a characteristic of the Pavias. I have not heard of its flowering in this country, although about ten years ago it flowered and fruited in France (in the Segrez Arboretum). There is a vigorous young tree in Messrs. Veitch's nursery at Coombe Wood, about 12 feet high, and there are several smaller ones in the Kew Arboretum. Whilst the leaves, both in size and texture, much resemble those of *Æ. Hippocastanum*, they may be distinguished by the paler coloured petiole and mid-ribs, and by the leaflets having a more drawn-out apex; each side of the mid-rib, too, is clothed with a short whitish tomentum, and there is little or not any of the reddish-brown wool seen at the base of the young

leaflets of the common Horse-Chestnut. The raceme of flowers is slender, and upwards of one foot long, the flowers being a yellowish-white. The fruits are 1½ to 2 inches in diameter, and slightly pear-shaped. The species is a native of Japan, and was found by Maximowicz in the Island of Yezo, in 1861, at sea level; in more southern Japan it is found at altitudes of 4000 to 5000 feet.

In the *Gardeners' Chronicle*, p. 717, June 5, 1889, there is a figure of *Æ. chinensis*. It is there suggested that it may possibly be the same as *Æ. turbinata*, a suggestion also made by Miquel. A plant under this name was exhibited by M. Lavallée in 1883 before the Central Horticultural Society of France, and a specimen with this name is now in the Kew Arboretum, but it has never flowered. The identity of *Æ. chinensis* is therefore obscure at present. *W. J. Bean*.

THE DISEASES OF PLANTS.

(Concluded from p. 140.)

Treatment of Bacterial Diseases.—Bacteria are said to produce several of the diseases popularly known as "rots." They have been proved to be the direct cause of diseases of Tomato, Cucumber, Carnation, Potato, Pear, and other plants; and they are frequently found accompanying other diseases, assisting them to destroy cultivated plants. In Tomato-fruits and Potato tubers, the disease manifests itself as rotting spots, which enlarge until the fruit or tuber is a putrefying mass; it also spreads rapidly amongst the growing plants, and will soon ruin stored produce. On Carnations and Cucumbers the foliage is first attacked, showing general unhealthiness, probably spotting, and a failure of growth, which results in defective flowers and fruits, if not in the total destruction of the plants. One of the Potato bacterial diseases attacks first the stems and foliage, and spreads thence to the tubers. The Pear disease appears on the bark, where it forms spots with a dark fluid exuding, and as a result the foliage withers and drops off, so that the fruit crop is spoiled. There is, as yet, no reliable fungicide known for bacterial diseases; and treatment can only be effected by careful cultivation. Forcing conditions are favourable to the spread of these diseases, as has been proved with the Tomato, Cucumber, and Carnation. In the case of indoor Carnations, a distinct benefit was observed when the plants were supported on wire-netting, so that the roots alone were watered, the foliage being lightly sprayed only now and then, and afforded as much air as possible. Similar treatment is also found to be beneficial for indoor Tomatoes and Cucumbers. In every case great care should be taken to remove diseased plants, and destroy them forthwith, and to see that houses and frames are kept as clean as possible. It may also be necessary to change the crop to a fresh house, care being taken to use plants from a new source in the new house. As yet it is impossible to say whether any particular varieties are proof against bacterial disease, but it seems quite probable that if the larger growers would make careful observations they would find varieties that are hardy and worthy of cultivation. The nests of Pear or other tree-killing bacteria should be scraped out, and some antiseptic dressing applied to the wound; these dressings will be considered in the succeeding paragraphs.

Treatment of Wound-fungi.—Certain diseases of trees and shrubs obtain a hold on their host-plants through wounded surfaces; space, however, forbids us giving more than a brief note about them, but those interested will find full details in the larger works of Professor Hartig (*Diseases of Trees*, translated by W. Somerville),

and Dr. Carl Freiherr von Tubeuf (*Diseases of Plants*, translated by W. G. Smith). The cultivators likely to suffer from cases of wound-fungi are those who have to employ pruning, i.e., fruit-growers and foresters. The fungi of this class are nearly all nursed on dead material or dying branches; thence they make their way into wounds on the living trees, and spread gradually from branch to branch and from tree to tree. Careful collection and burning of all material likely to act as a nursery cannot be too strongly recommended. Common diseases produced by wound-fungi are the "nectria" canker of Apple and other trees (e.g., Lime and Beech), and the common fungi, known as Polyporeæ, which produce large bracket-like spore-bearing outgrowths on many trees, such as Ash, Birch, Beech, and fruit trees. The "black-knot disease of Plum and Cherry, and the canker of Larch, are related to this group. In Italy the Olive plantations suffer from attacks of a Polyporus, and the growers keep it checked by cutting out the spore-bearing out-growths as soon as they appear, and then scrape the wounds clean. This treatment is the best one for all Polyporeæ, and has been recommended for other diseases, such as "black knot," or the various cankers occurring on trees. Thorough washings with strong solutions of some copper compound before the foliage appears are extremely beneficial. Timely spraying with Bordeaux Mixture or other fungicide is also recommended. Sulphate of iron (copperas) has been suggested, yet the results obtained do not altogether recommend its use; a wash of 4 to 8 lb. per gallon of water may be used, but as it is extremely caustic and injures machinery and clothing, it is best applied with wool or rag mops, and only on the old wood. The most effective method of treating wound-fungi is to dress all large wounds on trees with coal-tar. This is now done by the best gardeners who have to look after trees in parks, and in nurseries where the young trees are pruned into shape. It is therefore recommended as a covering for the larger wounds made by pruning fruit-trees, though it may be neglected in the case of young wood, which soon heals in the natural way. The coal-tar dressing is beneficial because it not only prevents the entrance of fungi into the exposed surfaces, but is also antiseptic, preventing the rotting of the wood, and assisting the perfect healing of the wound. Dressings of this kind are most effective when applied in autumn or winter on fresh-cut surfaces. Their universal use would go far to prevent many of the unsightly scars one sees on fruit and park-trees.

Root Diseases.—These are a common source of trouble to growers of plants. As, however, they are, in most cases, caused by conditions of the soil, or to the attacks of grubs or mites, they require but short notice here. The common root diseases of fungous origin are "Finger-and-Toe," and various forms of bacterial diseases. "Finger-and-Toe," that great enemy of all cultivated plants of the order Cruciferae (Cabbage, Turnip, Wallflower, &c.) is best checked by destruction of diseased specimens, and by a rotation of crops whereby the land is left free from cruciferous plants for some time. It has frequently been successfully treated by addition of lime to the soil at intervals of a few years. This and other modes of treatment have been discussed by various writers in publications available to every one (see the present writer's note in *Diseases of Plants*, Longmans, 1897, p. 527).

Before concluding this series of papers we shall give a few general rules for the treatment of

plants due to fungi :—(1.) Endeavour so that their growth is hardy and soundings as free as possible from any to injure them. (2.) Use clean necessary, clean the seed by the use of mixtures, as already described. (3.) g mixtures are to be effective, they

an attack is far advanced before being observed, then endeavour to save the remaining crop by at once destroying killed portions of plants or whole dead plants. This is a last resource, but it may do much to save fruit or flower ; it may sometimes be assisted by the use of spraying mixtures. (5.) The rearing and use of hardy or disease-proof varieties cannot be too strongly

ERYTHEA EDULIS, AT SANTA BARBARA.

THE accompanying illustration (fig. 46) is taken from the largest specimen of *E. edulis* known out of its native Guadalupe Island. It is growing at Santa Barbara, California, and is said to be over thirty years old. The roundish berries are three-quarters of an inch in diameter, and turn shining-black at maturity, when their pulp contains sugar enough to make them palatable, and better still if stewed like Prunes. This Palm remains comparatively rare in gardens, although it is not less hardy than the common Californian fan-Palm, *Washingtonia filifera*, nearly as fast a grower, and to be sure more graceful in appearance than the same. *Dr. F. Franceschi*.

QUEENSLAND BOTANY.

THE Department of Agriculture, Brisbane, has published a book by Mr. F. M. BAILEY entitled, *A Companion for the Queensland Student of Plant Life*. With this is incorporated *Botany Abridged*. The whole volume has now reached its second edition, and certainly deserves high commendation both for its aim and its method of attaining it. "To smooth the way to a knowledge of botanical nomenclature" is, in truth, a kindly deed. There is no more real difficulty in using correct names than in learning colloquial ones, if only beginners would believe it, since merely custom makes the latter seem easy. Mr. BAILEY strives to show the reason and meaning of botanical terms, and how the classification and nomenclature of plants are based upon the prominent or prevailing characteristics of the species. The information in it is admittedly gleaned from many sources ; large use having been "made of the works of BENTHAM, LINDLEY, HENSLAW, MASTERS, DE BARY, and COOKE," so that its reliability is ensured, and also its general as well as its local utility.

THE ROSARY.

THE WARS OF THE ROSES.

(Continued from p. 118.)

MANY were the searchings of heart when it was announced that the committee of the National Rose Society had chosen Norwich as the site for the last great battle of the season, and its suitability was loudly questioned by many of those who had been accustomed to take part in these battles. There was a howl from the men of the "West Country," who asked, "Are we to be expected to bring our Roses across Eng'land, and have them in good condition on the battle day? Why, we should be like the men who took part in the Jamieson raid, who were so exhausted after 150 miles' ride that they were unable to do anything." The answer to this was two-fold. "The shows had been held in the west, and you have expected the co-operation of East Anglian growers at your shows at Bath, Hereford, and Gloucester, and one remembers that some years ago Mr. Baker, of Exeter, carried off the chief prize at the Norwich show with a box of blooms that excited the wonder of East Anglian growers by their beauty and freshness, while at the western shows many of the East Anglian growers carried off the chief prizes." Objection also was made to Norwich being considered a northern town, but it could hardly be considered a southern one, and so the committee determined that it should for the nonce be called a northern one ; but really, after all, the question of geographical position does not matter so much as the date. In these days of rapid communication, Roses can be taken as well to one part of the country as the other, and the prizes at the northern shows were very often secured by southern growers ; moreover, East Anglia had for so many years contributed so largely to the success of the exhibitions of the National Rose Society, that when it was pleaded that the Society ought to have an exhibition there, the reasonableness of the request was at once recognised, for with such growers as Mr. B. R. Cant, Mr. F. Cant, and Messrs. Prior & Son,

FIG. 46.—ERYTHEA EDULIS, AT SANTA BARBARA.

plied early, and on the first appearance ; particularly all forms of mildew on foliage. Where the disease is expected (e.g. Potato disease), greater care will follow by instituting a regular two or three sprayings each season waiting till the disease appears. (4.) When the disease comes with little warning and assumes a virulent form (as with other bacterial diseases), also Peach and other diseases, where

recommended. To obtain useful disease-proof varieties suited for each class of soil is a thing much to be desired ; it is moreover true gardeners' work and far before the use of fungicides or other temporary means of relief.

Plant diseases due to fungi may or may not be common. It is no part of these papers to discuss this : their object is attained if they enable gardeners to combat or prevent a certain class of troubles to which plants in their charge are liable. *William G. Smith, Edinburgh.*

and such amateurs as Messrs. Foster Melliar, Berners, Orpen, and Page Robert, it would be difficult to find any part of the country where success was more likely to be secured; moreover, Norwich had had for many years a most successful Rose association affiliated to the National Society, and it was felt that its desire to have a national show held there ought to be gratified. The result fully justified the soundness of this decision. A most successful show was held. Exhibitors from various parts of the country came forward, although the chief and most successful exhibitors came from the south, and not from the north. Some of the more southern counties were unrepresented, while, as might have been expected, Norfolk, Essex, and Hertford contributed largely to the exhibition.

This was held in the grounds of Carrow House in connection with the annual flower show of the Norwich and Norfolk Association; it was arranged in five tents, but leaving the miscellaneous collection of plants, flowers, fruits, vegetables, &c., I will only notice the Roses staged in competition for the prizes offered in the National Society's schedule, and chiefly some of the most remarkable points. The weather had for some days previous to the show been very warm, and consequently there was a tendency amongst the H.P.'s to display their charms a little too openly. I think it was a gratification to many who, while wishing well to all exhibitors, saw the Jubilee Challenge Trophy awarded to Mr. B. R. Cant; he was not able himself to do much owing to excessive weakness, but it cheered the old man when his two sons were enabled to wire to him that he had carried off the trophy; not only this, but he secured the principal prizes in the nurseryman's classes. Amongst the amateurs, Mr. E. B. Lindsell was again the champion, having secured the Jubilee trophy and the principal prizes in his division; the Rev. J. H. Pemberton following closely on. The most remarkable feature in Mr. Lindsell's exhibits was his successful exhibit of Teas; he has always been, when at his best, unsurpassable in hybrids, possessing as he does a splendid soil, a good climate, and great experience, and now that he has come forward so successfully in the Tea classes, he will be a formidable antagonist to those who have had it pretty well their own way in this class. Another exhibitor who has stepped boldly to the front is Mr. Charles J. Grahame, and I have no doubt we shall hear more of him in another season. Those from the west, exhibited by Messrs. Townsend, of Worcester, showed that they did not consider distance an insuperable obstacle to successful exhibition. Mr. Orpen, who has made his mark as an exhibitor of Teas, had a grand stand of eighteen, for which he carried off the first prize. It is a matter of wonder to some that Mr. H. V. Machin did not occupy a more prominent position, for both the locality and date were in his favour. The absence of Messrs. Dickson & Son, of Newtownards, was much regretted, for it was hoped that if the north of Ireland was too far off, he might have obtained his flowers from Ledbury; but it was one of those mischances which take place in Rose-growing as in other things.

There is always an interest attached to the Medal Roses, and it is one of the points about which all exhibitors are anxious, and very few but those who have been engaged in the task can estimate the great difficulty of arriving at a right conclusion on the subject. It may be as it is said of the tasters of wine, that when they have tried a number of samples they find it very difficult to distinguish port from sherry; so when the judges have gone through the boxes and selected those which they consider worthy of the honour, they have great difficulty in determining to which of these it shall be awarded. There have been frequently failures—I have seen it awarded to a Rose from which the freshness of colour was gone, and whose chief merit seemed to be its size; while in another instance I have seen a misshapen flower given the Medal because of its brilliant colour—but I do not think that any mistake was made at this exhibition. In the amateur class, that for hybrid perpetuals was awarded to Mr. S. Barger, of Stevenage, Herts, for a well-formed and well-coloured bloom

of Mrs. John Laing, rather undersized for present taste; in the nurseryman's class Messrs. Harkness & Son gained the Medal for a very beautiful bloom of the Earl of Dufferin, which has been exceptionally good this season. In the Tea classes the Medal fell to Mr. Orpen for a grand bloom of Muriel Graham, finer even than that which obtained the same honour at the Crystal Palace show, exhibited by Mr. E. B. Lindsell. Some doubts have been expressed, even by eminent rosarians, as to the value of this sport from Catherine Mermet, for it is said that it was not distinct enough, and would most probably revert to the Rose from which it sported; but when a flower gains at two exhibits of the National during the first year of its distribution two Medals for the best Rose in its class, I do not think there can be much amiss with it. Some of those who once doubted have retracted their opinions, and one of our oldest and most successful growers, in writing to me the other day, said, "You need not be afraid to recommend Muriel Grahame, for it is a perfectly distinct and beautiful Rose." The Medal for the best Tea in the nurseryman's class was to a grand bloom of Niphetos, exhibited by Messrs. Mack & Son, and when shown in such style as this was, its beautiful form, large shell-like petals, and pure colour, claim for it unquestionably the position of the best white Rose in cultivation, notwithstanding that so many have claimed that honour since its introduction more than half a century ago, for it was sent out by Bougère in 1844, and there is probably no Rose which is so extensively cultivated for cut flowers for the London market as this fine flower. Pure whiteness makes it available for both bridal and general purposes, and its staying properties, owing to its thick petals, adds to its value.

When so successful a Society as the Norfolk and Norwich Horticultural Society undertakes the arrangement for exhibition, you may be sure that everything is done that can conduce to the comfort of exhibitors and judges, and the general arrangements of the show, and the thanks of the National are certainly due to Mr. J. J. Coleman for his giving the use of his beautiful park, to Mr. Powell, the energetic secretary, and to the committee, for their valuable aid; and they must have been gratified at the success which attended their efforts.

There is another view of the wars of the Roses which has been started by a leading horticulturist in one of your contemporaries, in which he calls in question much that is connected with the National Rose Society. I think, however, it would be premature to enter upon this subject at present, but I hope on some future occasion to touch upon the matter; in the meantime, let me say that I hope that all lovers of this beautiful flower will do their best to advance the interests of the Society, which has done more to encourage and extend its culture than anything else which has been done during the last twenty-five years. *Wild Rose.*

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 63 to 69.)

5. SOUTHERN COUNTIES.

(Continued from p. 142.)

MIDDLESEX.—The May frosts spoiled what promised to be a record fruit year, as the bloom was magnificent on all kinds of fruit-trees. Strawberries also suffered considerably, most of the early flowers being killed. *S. T. Wright, R. H. S.'s Gardens, Chiswick, W.*

—The long continuance of easterly winds throughout this district caused almost total destruction of Plums. Pears and Apples were also affected, but in a lesser degree. Cherries suffered slightly even on warm walls. From the same cause and cold nights, Peaches and Nectarines on west walls were greatly checked in the earlier stages of leaf development. Strawberries were never a finer crop here, the two kinds standing out most prominently being Royal Sovereign and Latest-of-All. *James Hudson, Gunnersbury House, Acton, W.*

—The fruit crop in this district is one of the worst we have experienced for many years. Apples

and Strawberries have been the only crops of any note; the spring frost killed all the Plums, early Pears, and small fruits. *William Bates, Cross Deep Gardens, Twickenham.*

—Our fruit crop is much under the average. Apples, Pears, and Plums, which promised so well, are a very thin crop; many trees have no fruit, they having suffered from the severe weather when in bloom. Peaches and Nectarines are excellent, and plentiful. Apricots dropped badly after setting. Strawberries were excellent; Royal Sovereign and Latest-of-All being our best. *G. Wythes, Syon, Brentford.*

SURREY.—The following varieties of Apples are fairly cropped:—Stone's, Warner's King, Lane's Prince Albert, Stirling Castle, Mank's Codlin, Blenheim Orange, Wellington, Cox's Orange Pippin, Hornsby's Pearmain. *C. J. Salter, Gardens, Woburn Hatch Lodge, Reigate.*

—A grander lot of bloom I never saw, but most of it was cut off with the frosts in May. Pears on walls have a fair crop. The following varieties of Apples are those bearing the most fruits:—Grenadier, Lady Henniker, Keswick Codlin, Lane's Prince Albert, Lord Suffield, Annie Elizabeth, Red Juneating, Stirling Castle, and Gloria Mundi. *Thos. Ormerod, Ottershaw Park Gardens, Chertsey.*

—The exceptionally severe late frosts injured the crops in many places. In one of our gardens the crop of Gooseberries was almost lost through this cause, while in another part of the garden they escaped, and carried a splendid crop. Apples are without exception a very heavy crop; especially is this so with young trees on the Paradise Stock; the fruit now looks well. *J. P. McLeod, Dover House Gardens, Rochampton.*

—Frost and cold winds prevailed during the time Plums, Apples and Pears were in bloom. Many of the bushes and orchard Apple trees have scarcely any fruit on them. Apple trees in sheltered positions are carrying good crops, especially Lord Suffield, Stirling Castle, Keswick Codlin, Lane's Prince Albert, and a few others. Pears, too, are satisfactory in the most sheltered spots, but where fully exposed to the wind and frost there is no fruit. The blooms on the earliest varieties of Strawberries were destroyed by frost, but mid-season and late varieties escaped. *G. W. Cummins, The Grange Gardens, Carshalton.*

—The extreme drought in the spring, with exceptionally sharp frosts, ruined all fruit crops. Strawberries were blackened, and the crop was of so fine as usual. Of Apples I have scarcely a glimmer. I fear there has not been much encouragement to increase fruit culture on a large scale during the past three years. *A. Evans, Haslemere.*

—Pears and Plums are almost a failure, and Apples also, with the exception of Lane's Prince Albert, Stirling Castle, and Grosvenor. Gooseberries are a medium crop, and the berries very large. Currants were a good crop, but injured a little by blight. *James Walker, Ham, Surrey.*

—Apples are better than we expected a few weeks ago. An old tree of Blenheim Orange is loaded with fruit, but there is not a fruit on the young ones. King of the Pippins bears a heavy crop. In the grass orchard that has been well top-dressed with rich soil, such as road-scrappings and pond-cleanings, &c., until the soil is quite loose and the grass luxuriant, we calculate upon having about a third of a crop. There are many trees that have not a single fruit. The following sorts have rather more than an average crop:—Lord Suffield, Keswick, Mank's Codlin, Quarrenden, Cellini, Minchall Crab, Alexander, Wellington, and Sandringham. In a corner of the kitchen garden, sheltered by some tall Elm trees, the trees will require a good many props. In another orchard, Yorkshire Beauty, Cox's Orange Pippin, and Garibaldi, two rows planted in pits on the grass, have not any fruit. In a cultivated orchard, with only the width of a walk between where Mangolds are grown with the aid of cow-manure, including Messrs. Webb & Sons' artificial Mangold-manure, both trees and fruit have a different

appearance to those planted in pits on the grass. Even in this cultivated orchard we have many blanks; it is quite in the open, with no shelter. The leading fruitful sorts here are Yorkshire Beauty, I may say in full crop, both in rows and single trees. On the grass this sort makes a nice pyramid or bush; in a young state it bears its first fruit on the points of the shoots, which should not be pruned until it makes its natural spurs. With a little attention in pruning, it makes a handsome and evenly-balanced standard. Other sorts in this orchard with anything like a crop are Devonshire Quarrenden and Lord Suffield. There is scarcely a sprinkling of Pears or Plums. All trees with no fruit upon them are being summer pruned with the "Standard Pruner," having two sizes, 6 and 12 feet long. Pears are a thin crop, with the exception of some standards of Beurré d'Arenberg, Beurré Diel, Beurré Bachelier, Beurré Hardy, Beurré d'Amanlis, and Fondante d'Automne. Espaliers of some varieties on sheltered branches are bearing an odd fruit or two. Cordon Pears planted seven years ago, 15 inches apart, are, most of them, 16 feet high, trained perpendicularly. They are fruitful, and appear excellent. By a system of close early pinching of the side-shoots, the trees were brought to a fruitful state early. The first pinching is given when the shoots are about 6 inches long, and is not discontinued as long as there is growth. The trees are upon the Quince stock. Pitmaston Duchesse has been the most stubborn of all to bring into fertility, but this year it shows three fine fruits, and a plenitude of fruit-buds. On a south aspect the following are the sorts that are carrying from two to three dozen fruits each; very few trees have none:—Durondeau has a nice crop, but the fruits are too soon gone; Ne Plus Meuris, and next Pitmaston Duchesse, Knight's Monarch, Glou Morceau, Winter Nelis, Josephine de Malines, and Beurré Rance, all useful Pears, both as to eating and keeping; Jargonelle and Williams' Bon Chrétien, Doyenné du Comice, a grand Pear, Beurré d'Arenberg, a capital keeper and good dessert Pear, and Beurré Diel. On a western aspect there are more blanks amongst the cordons this season. Baronne de Mello, thin; Beurré Bachelier, good; but Nouvelle Fulvie, Magnate, Jolei de Bonneau, Vicar of Winkfield, Beurré Duval, Van de Weyer Bates, Belle Julie, Dr. Trouseau, Duchesse d'Angoulême, and St. Germain, are all blank; Louise Bonne of Jersey has a wonderful crop. *J. Miller, Ruzley Lodge Gardens, Esher.*

SUSSEX.—On May 12 we registered 9° of frost which spoiled most of the bloom on Apples, Pears Plums, and Strawberries, and partly so on Gooseberries and Currants, Walnuts and Apricots, although the latter were given a certain amount of protection. *F. Geeson, Cowdray Park Gardens, Midhurst.*

— Peach trees showed fairly well for fruit, but were attacked with blister and almost killed. Pears generally have a good crop, but trees of Marie Louise are noticeable for very poor crops. The excessively wet autumn last year in this district, I think, had something to do with the poor crop of Strawberries. *Alex. Reid, Junr., Posingworth, Cross-in-Hand.*

— Owing to the ungenial weather in spring most fruits suffered severely. Peaches on the south-east walls were badly blistered. Pears in the open are few, but on walls where protection was afforded there is a fair crop. Cherries, though not more than an average crop, have been very fine; while Apricots, though sadly crippled with the frost, are the best we have had for some years. Strawberries were not a heavy crop, and Royal Sovereign was the best. *H. C. Prinsep, Buxted Park, Uckfield.*

— Never was the prospect for an abundant fruit crop of all kinds better than this year until May 14, when a severe frost effected wholesale destruction, especially amongst Cherries, Plums, Strawberries, and Apples. Lord Suffield, Keswick Codlin, Cox's Pippin, Cellini Pippin, Stirling Castle, Hambledon deux Ans, Reinette du Canada, Ecklinville Seedling, New Hawthornden, Irish Peach, and Old Nonsuch are bearing full crops. *E. Burberry, Castle Gardens, Arundel.*

— The general fruit crop in these gardens is barely an average one, so much of the bloom being destroyed by frost on May 12. The foliage of Peaches and Nectarines suffered very much from blister during the early stages, but the trees are now clean and healthy, and carrying full crops. Plums are very scarce in this neighbourhood; as are Apricots. *Richard Parker, Goodwood Gardens.*

— We had a good show of Apple blossom, but it was injured by the May frosts; in places some trees are loaded; in one of my orchards I shall not get 10 bushels. Pears are very poor, as are also Plums; but all bush fruits were wonderful. *G. D. Duncan, Warnham Court, Horsham.*

WILTSHIRE.—The Apple, Pear, and Plum crop is, I think, the worst I have known during the last thirty-six years. This is due to a large extent to severe frosts in the early part of May, especially on the morning of the 13th, when there were 8° of frost. The fruits and blossoms on all unprotected trees, whether on walls or in the open garden, fell off, or were greatly injured. *T. Challis, The Gardens, Willon House, near Salisbury.*

7. ENGLAND, N.W.

LANCASHIRE.—The fruit crops are very variable; some gardens have no crop of a particular variety or kind of fruit, whilst the same variety or kind is abundant in another garden not distant. Only once in seventeen years has the Pear crop been so poor as it is this year in this garden, the only tree bearing a full crop being Louise Bonne of Jersey worked on the Quince. Another tree near it 40 feet high, on the Pear stock, has scarcely any fruit. *W. P. Roberts, The Gardens, Cuerdon Hall, Preston.*

— The Apple and Pear crops generally in this district are below the average. The unusually severe frosts during the whole of the second week in May killed the blossom, of which there was a great profusion. Being well sheltered, our crops are much better than our neighbours'. Apples bearing full crops are Grenadier, Golden Spire, Mère de Ménage, King of the Pippins, Tower of Glamis, &c. Pears: Doyenné du Comice, Williams' Bon Chrétien, Louise Bonne of Jersey, Easter Beurré, &c. *B. Ashton, Lathom Park Gardens, Ormskirk.*

WESTMORELAND.—Blossom was plentiful and strong, but many succumbed to sharp frosts in May. Amongst Apples, King of Pippins, Annie Elizabeth Northern Greening, Ecklinville seedling, Keswick Codlin, and Fearn's Pippin are loaded. Cherries and Pears are few, but Marie Louise and Doyenné du Comice are good. Amongst Strawberries, Dr. Hogg still keeps to the front; Royal Sovereign, Empress of India, Sir J. Paxton, and A. Nicaise do well. *W. A. Miller, Underley Gardens.*

— The Apple crop looked very promising when in bloom, but the dry month of May and the caterpillar together, in many instances destroyed the crop. The show of bloom on Plum trees upon walls or as pyramids, was very thin. Our best varieties are Victoria, Golden Gage, Early Prolific, and Golden Drop. Strawberries on strong ground were very fine indeed. Our best were James Veitch, Countess, Auguste Nicaise, and Empress of India. *J. Clarke, Lowther Castle Gardens.*

8. ENGLAND, S.W.

CORNWALL.—Apples are an average crop. Pears very few, also Plums, Damsons, and Gooseberries. The cold winds cut the Peach and Nectarine trees very much, and in some cases quite killed them. I never saw trees looking better when in bloom. *W. H. Bennett, Menabilly.*

— The Apple crop in East Cornwall is an average one, and some varieties carry a heavy crop, King of the Pippins, Irish Peach and Blenheim Orange Pippin being the best amongst the dessert varieties; of ordinary varieties, Alfriston, Keswick Codlin, and Bismarck are good. Pears are very poor; cold winds and heavy rains during the blossoming time ruined the crop. I have never seen Peach and Nectarine trees so badly cut. We had strong east winds for

ten days at the end of April, and frequent hailstorms, which, in spite of protection, cut the leaves off in many cases, and spoiled the trees for the season. *Chas. Page, Boconnoc Gardens, Lostwithiel, Cornwall.*

— The fruit crop is the worst I have experienced for twenty years; the trees gave great promise early in the season, but the cold, blighting winds cut them to pieces. I never saw Peach-trees so badly blistered, and some trees were hit so badly that they have not recovered. Many of the large Plum orchards in this neighbourhood are entirely destitute of fruit. *Wm. Sangwin, Treilick, Truro.*

DEVONSHIRE.—The fruit-crops are a comparative failure in this district, though the trees bloomed more abundantly than for years past. This I attribute less to an ungenial spring than to the drought that has prevailed here for some seasons past, and culminated in the dry and burning summer of last year when the rains came too late to enable the trees to recover. They did this sufficiently, however, to put forth an abundant bloom, which exhausted them, for though in many instances the bloom appeared healthy, and to "set" well, the fruit has since dropped, and left but a thin and meagre crop. *A. Eames, Henton Satchville, Bexford.*

— Fruit trees blossomed well with the exception of Plums, and all appeared to have set well, but the cold east wind that was prevalent after the flowering stage, injured Peaches, Apricots, and Pears. All fruit bushes have been heavily laden, also Strawberries, and the fruit was of good quality. *J. Mayne, Bicton Gardens.*

GLOUCESTERSHIRE.—The fruit crops are fairly good, although below the average. Apples are very good indeed; the varieties, Keswick Codlin, Ecklinville Seedling, Warner's King, Peasgood's Nonsuch, King Pippin, and Ashmead's Kernel are the best. Cider fruit is abundant. *G. W. Marsh, Arle Court, Cheltenham.*

— All fruit trees produced an abundance of bloom; and the north-east wind, and absence of sun rather than frost, caused the subsequent failure. Apples and Plums are a complete failure. A few orchards in sheltered positions are bearing a fair crop. This is the first time in seventeen years that Borsdoffer Apple has not had a good crop. *Richard Shore, Berkeley Castle Gardens.*

— The fruit crops are the worst we have had for some years, which is undoubtedly due to the sharp frosts that occurred late in May. *Thomas Shingle, The Gardens, Tortworth.*

HEREFORDSHIRE.—Such varieties of Apples as Ecklinville Seedling, Stirling Castle, Keswick Codlin, Golden Spire, and Tower of Glamis are bearing very fine crops. Dessert varieties are also good, Worcester Pearmain, King of the Pippins, and White Transparent especially so. Pears are a failure, owing to frost, cold winds, and the Pear-midge. Plums are quite a failure, as are Cherries. *C. A. Bayford, Glenstone Gardens, Ross.*

MONMOUTHSHIRE.—The most unsatisfactory crops this year are those of Plums and Cherries, and their poverty may be attributed to the prevalence of cold, dry N.E. winds while the trees were in blossom. Both Apples and Pears are partial, the best crops being in sheltered situations. Upon pyramid trees of Apples there are good crops of the following varieties:—Cellini, Beaumann's Red Reinette, Grenadier, Lane's Prince Albert, Peasgood's Nonsuch, Sandringham, Schoolmaster, Warner's King, Belle Pontoise, Cox's Orange Pippin, and Duchesse of Oldenburgh. Red Currants suffered much from aphids. Strawberries were excellent in every way, Royal Sovereign, Leader, Gunton Park, President, Vicomtesse Héricart du Thury, and Latest-of-All being remarkably so. *Thos. Coomber, The Hendre Gardens, Monmouth.*

— Apples are scarce, the only sorts carrying heavy crops being Golden Pippin, Calville Blanche d'Hiver, Hawthornden, and Norfolk Beaufin. Pears, which were a charming sight in spring, being covered

with bloom from the stem outwards, but are only an average crop. Peach and Nectarine trees are looking remarkably well, and they are carrying heavy crops, which give every indication of swelling to a handsome size. Plums in these gardens are a failure, while Morello Cherries are under the average, but very fair. What fruit we have of Apples and Pears is free from blemish. *W. P. Woods, Llanfrechfa Grange Gardens, Caerleon.*

— The prospects of an abundant crop of all kinds of fruit were never better than in the spring months of this year, the orchard and garden trees being covered with blossom; but unfortunately, in many parts of the county, we have been doomed to disappointment, through the biting easterly winds and frosty nights experienced in April and May. Not only has the Plum crop been almost entirely destroyed, but in many places the trees have succumbed. In my fruit ground at least a dozen strong trees are killed. Cherries are a failure. Pears almost as bad, with exception of Marie Louise d'Uccle and Bon Chrétien. Some trees of those two varieties have fair crops. Apples are very irregular, and very few are to be seen in the grassed orchards in exposed situations. Local varieties grown as standard trees in sheltered positions where the soil has been cultivated and well manured, are carrying very heavy crops of fruit. Several varieties worked on the dwarfing stock, such as Ecklinville, Laue's Prince Albert, Bismarck, Sandringham, Stirling Castle, Keswick, Lord Grosvenor, New Hawthornden, Mabbot's Pearmain, Adams' Pearmain, Cellini, New Northern Greening, Evagil, Hoary Morning, Peasgood's Nonsuch, Golden Spire, Newton Wonder, Frogmore Prolific, and Tyler's Kernel are carrying fair crops. This, however, applies only to garden trees. Gooseberries have been a very heavy crop, some varieties averaging from 20 to 24 lb. per bushel. Of Raspberries, Superlative has proved by far the best. Strawberries are not much grown in this county for market purposes. In the few cases where they are, reports are not good. Upon the whole, I can safely say we are considerably under the average. *John Basham, Fair Oak Gardens, Bassaleg, near Newport.*

SOMERSETSHIRE.—Small-fruits have been plentiful, but the stone fruits are under average, the frost and cold winds having destroyed the bloom. Peaches and Nectarines are an average crop where protected. Apples in sheltered situations are an average crop and large in size, but generally where not sheltered in orchards, there are very few fruits. Pears, a good crop on some of the late trees. *Thos. Wilkins, Inwood House, Henstridge.*

— Apples set very well, but dropped from late frosts, also Pears; a few Pears now carrying fine crops are Vicar of Winkfield, Jargonelle, Beurré Bachelier, and Williams' Bon Chrétien. Plums are almost a failure in the district of Frome, Victoria being amongst the best, and strange to say Green Gages are far more numerous than black varieties. *A. Young, Marston Gardens.*

— During the thirty-five years I have had to do with a garden I have never seen a grander promise for Apples, Pears and Strawberries; but the severe frost in May, just as the Apple bloom was setting, destroyed our hopes. In our garden, Pears as large as one's thumb were turned black and dropped off. Lord Suffield, Domino, and Royal Somerset Apples are the best crop; and in Pears, Winter Nelis, King Edward, and Old Crassane. *John Crook, Forde Abbey, Chard.*

WORCESTERSHIRE.—Taking the fruit crop on the whole, the present season is a disappointing one. It opened, however, with great promise, both Apple, Pear, and Plum blossoms opening strongly, but the disastrous May frosts, coupled with the lengthened period of cold and cutting winds, and a low temperature generally, told its tale on the embryo fruits. The Plum crop is the worst, although in this garden there will be a half crop of Damsons, but in the district there are thousands of trees without a fruit. Apples and Pears are partial, on some trees there are

heavy crops, and on others none. For instance, we have a large tree of Blenheim Orange carrying a heavy crop, and on others there is none. The same with Dumelow's Seedling. That good old local variety Tom Put is carrying a good crop generally. Small fruits good, although in the open fields Black Currants are a poor crop. *A. Young, Witley Court Gardens, Stourport.*

— Apples are a good half-crop, but very partial; trees here and there heavily laden; others a short distance away quite barren. Some of the young, well-cared for orchards, recently planted on this estate, are very encouraging, especially the Codlin types of Apples, showing fine clear fruit. Pears are good, and have clear skins, a fair average crop of nearly all the leading kinds. Perry Pears, too, are abundant. Plums of all varieties are a complete failure: 14" of frost when in flower being the primary cause. Apricots suffered likewise. Peaches and Nectarines on walls had their leaves badly blistered by cold, damp, and by easterly winds. *W. Crump, Madresfield Court Malvern.*

(To be continued.)

TREES AND SHRUBS.

PINUS PARVIFLORA.

As a perfectly hardy, free-growing, and decidedly ornamental Pine, the above species is certainly not sufficiently recognised in this country. It is of comparatively low and spreading growth, with flexible, up-curved branches that are well supplied with foliage. The leaves are in bundles of fives about 2 inches long, slightly twisted, bluish-green on the exposed, and distinctly silvery on the inner, sides. Cones are freely produced, usually several together, each from 2 to 2½ inches long by 1½ inches diameter at the widest part, and composed of hard, brown, widely wedge-shaped scales. Two seeds are contained beneath each scale, these being ¾ of an inch long with a broad wing of the same length, 2,800 being included in 1 lb. weight. The bark is of a light greyish-green colour. In early spring, the beautiful yellow male catkins render the tree highly conspicuous. I have seen beautiful examples of this Pine in the north of Ireland, where they were growing fully exposed on light gravelly loam. *A. D. Webster.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By H. W. WARD, Rayleigh, Essex.

Gathering Ripe Fruit.—Pears and Apples that are ripening [should be gathered forthwith, and placed on the shelves in the fruit-room, care being exercised not to bruise the fruit. In fact, those entrusted with the gathering and storing of fruit should handle them as lightly as possible, to avoid discoloration and decay occurring. One layer of fruits will be sufficient on the shelves, as there is probably plenty of shelf-space at the present time. Among the Apples now fit for storing may be mentioned Kerry Pippin, Lady Sudeley, Worcester Pearmain, Red Astrachan, and Yellow Ingestre Pippin. The varieties of Pears which require to be gathered during the next week or two are Souvenir du Congrès, Clapp's Favourite, Petite Marguerite, Beurré d'Amanlis, and Williams' Bon Chrétien. The fruits part readily from the trees when nearly ripe, a stage of growth which the colour and aroma of the fruit, coupled with a practical acquaintanceship with the characteristics of the several varieties on the part of those engaged in the work, will indicate.

Peaches, Nectarines, and Plums.—Fruits of late Peaches, such as Golden Eagle, Princess of Wales, Warburton Admirable, Thames Bank, Sea Eagle, and Salway, should be exposed to the sun as much as possible, or the colour will be pale.

Autumn Pruning.—Young growths which have been made since the summer-pruning was done, should be shortened back to within 5 or 6 inches of the branches from which they spring. Leading shoots on wall and espalier-trees require to be secured in the spaces which they are intended to furnish,

Thinning the Wood of the Early Peaches and Nectarines.—Trees of Early Alexander, Waterloo, Amadeus June, and Hales' Early Peaches, and Early Rivers and Lord Napier Nectarines, should be pruned forthwith. It is waste of the forces of the trees to leave shoots and branches till the beginning of next year, which ought to be cut out as soon as the fruit is gathered, or as soon after as possible. By thinning the surplus growths, and cutting clean away old spurs, the shoots retained for yielding next year's crop will become better matured.

PLANTS UNDER GLASS

By G. H. MAYCOCK, Gardener, Luton Hoo Park, Luton.

Violets to flower during winter may now be planted in cold frames. The following method has proved to be the best here. Frames in which early Potatoes were forced are used for the earliest plants. The frames are replaced on the old hot-beds, tilted to a sharp angle, and then three parts filled with soil, which is made moderately firm. If the plants were treated as advised on p. 234, vol. xxi., they will lift with a good ball of soil, the whole of which is preserved intact after removing any earth-worms that can be seen. Plant the roots firmly, and sufficiently close to the glass, that when the work is completed the leaves will come within an inch of it. Good soakings of water should be given every few days for the first fortnight, during which time the plants should be kept cool. The lights may then be placed over them, and a covering of Cocoa-nut fibre refuse should be spread evenly over the surface of the soil, and close up to the crowns of the plants. This will impede evaporation and serve the purpose of keeping the flowers clean. Remove all decaying leaves as soon as seen, and give abundance of air on all favourable occasions. Plants to bloom later are treated similarly, but they are planted in brick pits, in the place of wooden frames, the former being more capable of resisting frost. Fire heat, at bottom or top, is never resorted to. The variety Marie Louise will give an early and a continuous supply of blooms. Nespolitan and the double whites yield a late supply.

General Work.—Richardias, Salvias, Abutilons, and other species that were planted out in the spring should now be prepared for lifting when this becomes necessary. To this end, a bright spade should be forced round the side of each plant a few inches from the stem, according to the size of the pots it is intended to place them in. Keep the points of Chrysanthemums and other plants tied, as occasion requires. Advantage should now be taken to cleanse any structure that was not cleaned last spring; it being much more easily done before the plants are housed than afterwards. Obtain a stock of bast mats and other protecting material in good time.

THE KITCHEN GARDEN.

By W. POPE, Gardener, Higholere Castle, Newbury.

Turnips.—Late crops will require to be thinned, and the land stirred so long as the leaves of the plants do not meet across the spaces; and all weeds destroyed. Autumn sowings being prone to make spindly growth and poor bulbs if allowed to become crowded in the smallest degree, hence the need of timely and severe thinning. Always use the hoe after thinning, pulling up large weeds and removing them from the land to prevent their growing again. If the late sowings have not been made, or they have failed to grow, sow seeds of a quick-growing variety forthwith on the chance of a mild autumn occurring. Early Milan is a variety which, if sown at this date, will quickly form roots, and it is tender eating, but not a long keeper when left in the ground, although if lifted and stored when large enough for use, it remains in good condition for a long time. To keep Turnips in store they should be embedded with their tops free in slightly moist earth, in a cool light cellar or shed. Some of the Swede Turnips for table use are more delicate in flavour than the ordinary type, and very hardy, and seed may also be sown at this date.

Kidney Beans.—An abundant sowing of some varieties of Kidney Beans, of the Ne-plus-ultra type, should be made in pits or frames at about this date. It may not always be necessary where this follows another vegetable crop to put fresh soil into the pit, &c., it sufficing simply to clean and level the soil and draw drills 15 inches apart and 3 inches deep, sowing the seeds thinly. If the bed of soil is very dry, it should be copiously afforded water two days before the sowing is made. The lights should not be used before frosts threaten, and then only at night. This crop will be a valuable one to follow Scarlet Runners and French Beans cut off by early frosts.

Seed Gathering and Clearing off Old Crops.—Take advantage of dry weather to harvest ripe seeds of Peas and Broad Beans, thrashing them out and thoroughly drying them in the sun before storing them in the seed-room, or they may be left in the pods till a wet day affords the opportunity to get the job done. It is good policy to endeavour to perpetuate or improve a selected stock of any kind of vegetable by saving a small quantity of seed each year, only the best plants being selected as the seed-bearers. It is not advisable for a gardener in a private place to save seeds on a large scale, this being done much better and cheaper by the professional seed-growers. The remains of vegetable crops of all kinds should be cleared off the quarters without delay, as not only is the land impoverished by their being retained, but the space they occupy can be more profitably employed for growing Coleworts, Asparagus, and Buda Kale. This last is a capital spring vegetable, being late in running to seed, and coming into use at a time when other vegetables have become scarce.

THE ORCHID HOUSES.

By W. H. WARR, Orchid Grower, B. rford, Dorking.

Cool-houses.—The *Lycastes* are in full growth, and until the pseudo-bulbs are fully completed, the plants will require a plentiful supply of water. Keep them well shaded from the sun. The present is the best season to overhaul the *Masdevallias*. Some of the more vigorous plants will require additional root-room; others that are healthy, and have sufficient space, will only need to have the old soil picked out and fresh compost substituted for it. Large masses that have overgrown the edges of the pot, and become bare in the centre, may now be safely divided and re-made into compact specimens; or, if for trade purposes, they may be broken up into small pieces and potted separately. For the stronger-growing plants, as *M. Veitchiana*, *M. Lindenii*, *M. macrura*, *M. ignea*, *M. Chelouii* × *M. cucullata*, *M. amabilis*, *M. corniculata*, *M. peristeria*, *M. coriacea*, *M. Ehippium*, *M. Gargantua*, *M. elephanticeps*, *M. Fraseri* × the yellow *M. Davisii*, and the numerous forms of *M. Harryana* (occinea), pot-culture is preferred. These *Masdevallias* are deep-rooting plants. After several experiments, I find that they grow stronger and produce a greater number of blooms when potted into deeper compost than usual. Those who do not grow their *Masdevallias* satisfactorily, I would advise to try this method, and at the same time to select pots that are in proportion to the size of the plants—the object being to lessen the amount of shallow-surface rooting-space, and to induce the roots to grow downwards into the soil. Secure good drainage by placing a hollow piece of crock over the hole at the bottom of the pot, and just cover it with a layer of smaller pieces; then add a thin layer of sphagnum-moss, and for the rest make use of peat and moss in equal proportions. Carefully work the soil in amongst the roots, placing here and there a moderate-sized crock, to assist the escape of water. Pot moderately firmly, and keep the base of the plant about on a level with the rim of the pot. After the plants have been repotted, afford them one thorough watering, but until the roots have had time to get a firm hold again, afford just sufficient to keep the surface of the compost moist. Such treatment should be continued throughout the winter months. In early spring, when growth recommences, the plants should be kept thoroughly moist. Such dwarf-growing varieties as *M. Stella* ×, *M. Gairiana* ×, *M. Courtauldiana* ×, *M. Henrietta* ×, *M. Shultzyana* ×, *M. caudata* Shuttleworthii, *M. calura*, *M. Rolfeana*, *M. infracta*, *M. triangularis*, *M. Tovarensis*, *M. Schroderiana*, *M. inocharis*, *M. fragrans*, *M. melanopus*, *M. maculata*, *M. Parlatoresana*, *M. racemosa* Crossii, *M. Reichenbachiana*, *M. rosea*, *M. torta*, and many others, when intermixed with the stronger-growing kinds, are not easily observed. It is a good plan, therefore, to erect a lattice-work stage at one end of the house, placing it on a level with the foliage of the larger plants. In such a position the plants are nearer the light, which is very important, and where they may be more closely examined. All of them grow well in pots. Other dwarf species, which form pretty tufts when in bloom, are *M. Armini*, *M. Wagneri*, *M. hieroglyphica*, *M. floribunda*, *M. muscosa*, *M. picturata*, *M. Wendlandianus*, *M. triadactylites*, *M. simulata*, *M. Estrata*, &c. These plants, if house-room be limited, may be suspended to the roof in small shallow pans; in such a position they do very well in winter, but during the heat of summer they thrive best when placed down upon the stage with the other dwarf varieties. *Masdevallias* are comparatively cool-growing species, and during the summer they succeed with the *Odontoglossums*; but if, after root-disturb-

ance and through the winter, they can be afforded a few degrees more warmth than the *Odontoglossums* require, they will thrive luxuriantly. The pure white *M. Tovarensis* should not be repotted now unless the compost has become sour, or the plants are in a bad condition at the root.

THE FLOWER GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Hydrangeas.—These comparatively hardy shrubs make a good show in shrubby borders, and if it be desired to increase the stock, cuttings may be readily struck at this season. *H. paniculata grandiflora* and *H. hortensis* are both equally useful, the former for planting in beds over a suitable carpet, and the latter for facing the shrubbery. Cuttings should be made from the points of half-ripened shoots, and be inserted singly in pots of light sandy soil, and placed in a frame on a slight hot-bed. The top air should be kept somewhat cool, and if a little bottom-heat can be afforded, roots will form quickly. Plants so raised may be flowered in pots the next season, and will produce one strong flower-head, after which they may be planted in the borders if desired.

Veronias in several species may be similarly propagated. *V. Traversii* is a free, whitish-flowered species, that quickly grows into a large and handsome bush.

Pentstemons.—Notwithstanding the late dry weather, seedling and other *Pentstemons* have made a strong growth, and are flowering freely. Where propagation from cuttings of select named varieties or choice seedlings is carried out, the young growths now springing from the base should be used for this purpose. The cuttings when made should be inserted to the number of four or five round the sides of large 60-sized pots, filled with sandy soil, and stood in a close frame. Seeds may also be sown at this date, and the seedlings kept in a cold frame and protected from severe frosts, to be planted out early next summer.

Verbena beds are full of flower, and to keep them in this condition as long as possible, the seed-vessels should be removed as soon as the flowers drop. If it is desired to increase any varieties from cuttings, they will strike readily if placed in pots of sandy soil and stood in a close frame, or plunged in a frame having a slight bottom heat.

Aubrietia Edgings.—As a substitute for Box edging in the flower and herbaceous gardens furnished with gravel-paths, the close-growing *Aubrietias*, as *deltoides græca* or *Campbellii*, are useful. Such an edging has advantages which Box does not possess, for during a portion of the year it is a mass of bloom, and it is less trouble to keep in order. The present time is a suitable one for planting new, or for cutting back established edgings. The trimmings from the latter make excellent material for the formation of new borderings. The ground should be prepared similarly as for Box-laying, treading the soil flat and firm, and planting with a line. The soil edge should be chopped down squarely 2 or 3 inches nearer the path than the line of plants, which the *Aubrietia* will quickly cover.

General Work.—Remove faded flowers and decaying leaves from the flower-beds, doing the work if possible when the foliage is dry. Dahlias should be disbudded if large blooms are required, and the growths made secure with bast. Many of the perennial Sun-flowers are now at their best, and note should be made if any of the clumps require to be divided; yellow flowers not being allowed to preponderate over other colours, and some of the varieties, as *H. letifolius*, increase so fast as to require partial removal annually. Lawn-grass is growing fast, and weekly mowings will be necessary. The sweeping and rolling of gravel-paths after rain should have due attention.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Leicestershire.

Peaches and Nectarines.—The trees in the early houses must not be permitted to lack water at the root, either at the present time or through the autumn or winter, dryness of the soil being one of the chief causes of bud-dropping. I have noticed that it is almost always the earliest trees which suffer the most from this vexatious malady, water being withheld owing to the pressure of work, or want of thought. An occasional heavy syringing overhead will likewise tend to keep the foliage healthy and free from insect pests. As fast as the fruits are cleared from the trees in late houses and wall-cases, thin out the shoots that have carried fruits, so as to let in the sunlight to the current season's wood. Go over the

trees in bearing, and remove all foliage from around the fruit, either cutting it off or putting it aside, affording air freely by day, and closing the house at night, the air commencing now to get damp and chilly. Protect the fruits from wasps, either by covering the trees or the window-openings, &c., with fine netting.

Vines.—What has been stated about the borders of Peach-trees applies equally to the earliest vines, which must not be neglected after the crop of Grapes has been removed, but they must be afforded clear-water alternately with manure-water of various kinds. Advantage should be taken of the indraining of rain-water into the manure-water tanks, to employ it upon the inner borders in liberal quantity, first ascertaining if the borders are in need of moisture. I have carried on this practice for three successive years at this season and during the winter, with the result that the Vines have been wonderfully improved. Vines carrying ripe Grapes, and the latest Vines, must be protected from wasps and flies, and from injury by decaying berries. Great care must be used in damping-down and ventilating, doing less of the former, and affording a small amount of air at the top, but no air at the front of the vineries at night, and assisting the circulation of air in the vineries by maintaining a slight degree of warmth in the heating-apparatus. Remove all redundant growth from Muscat Vines, and thus let in the sun to the bunches, so as to bring up the colour of the Grapes.

THE APIARY.

By EXPERT.

The Super-clearer or Bee-escape.—No appliance of recent years has rendered more help to beginners in bee-keeping than that known as the super-clearer. It is well worth while for everyone who keeps bees to pay especial attention to the proper working of this little appliance, since by its use honey may be removed without the slightest risk of giving annoyance to neighbours, no matter how near. It needs but to rise early before anyone is about, set on the clearer, and at night lift the honey off and carry it indoors without disturbing a single bee. Always use a little smoke when taking honey, and be careful to carry all racks of sections and surplus chambers indoors as soon as cleared of the bees. Allow no broken pieces of comb with honey to be lying about, and take every precaution to prevent robbing being started. Bear in mind that as soon as the honey income fails, and the bees are being deprived of their stores, they naturally begin to attack weak hives, and robbing once started is difficult to stop.

Extracting.—Shallow frame-boxes full of combs should not be removed till wanted for extracting purposes. The honey keeps better on the hive than in the house; at the same time, no extracting should be deferred longer than can be helped after the honey is sealed. Special care is required in handling newly-built combs heavy with honey in hot weather, especially if they are not built down to the bottom bar of the frames. The bees should in these cases be brushed off the combs with a feather—not shaken off as is usual. Always return frames to the hives after extracting in the evening, and let them be placed in the same hives and in the same position they filled before the honey was removed. A little care in handling honey indoors will keep the bees from trying to enter the house. When excluder zinc has not been used, queens are occasionally found in supers while clearing them of bees. A look-out is therefore necessary to see that she is not thrown on the ground at a distance from the hive and lost. Frames from which the honey has been extracted should be given back to the bees to clean up before being packed away for the winter; always do this in the evening, as it excites the bees a good deal, and they have time to settle down before the morning.

Removing Honey.—Notwithstanding the recent glorious bee-weather, the end of surplus gathering for 1897 is rapidly nearing a close; indeed, except in heather districts and in the far north, the season is now virtually over. All surplus-honey may therefore be removed. Nothing will now be gathered over and above what may, with real and wise economy, be left for the bees' own winter stores. Unsealed sections and shallow frames should be removed and extracted at once, as no sealing will now be done, and the honey will be taken down to the bottom of the hive if left on longer. In some seasons, bees are irascible and mischievous when being deprived of their stores, and unless an apiary is kept quiet and free from the wild disorder we sometimes meet with, a great deal of annoyance may be caused, not only to the bee-keepers themselves, but to neighbours as well.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	SEPT. 4	Société Française d'Horticulture of London, Meeting. Isle of Wight Horticultural Improvement Society's Meeting.
TUESDAY,	SEPT. 7	Royal Horticultural Society's Meeting. National Chrysanthemum Society's Early Show.
WEDNESDAY,	SEPT. 8	Royal Caledonian Horticultural Society's Show, Edinburgh (three days). Derbyshire Agricultural and Horticultural Society's Show, at Derby (two days).

SALES.

MONDAY,	SEPT. 6	Unreserved Clearance Sale of Ferns and other Plants, at the Ealing Park Nursery, Windmill Road, Brentford, re W. B. Southce, deceased, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	SEPT. 7	Clearance Sale of Palms, Ferns, Camellias, Azaleas, &c., at The Rose Nursery, High Street, Clapham, by order of Mr. G. B. Fletcher, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	SEPT. 8	Sixtieth Great Annual Trade Sale of Winter-blooming Heaths, at the Longlands Nursery, Sidcup, by order of Messrs. Gregory & Evans, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	SEPT. 9	Third Great Sale of well-grown Palms, Foliage and other Plants, at the Kew Nursery, Richmond, S.W., by order of Mr. K. Drost, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	SEPT. 10	Second Annual Trade Sale of Heaths, Roses, &c., at the Mill Lane Nursery, Cheshunt, by order of Mr. E. Roebford, by Protheroe & Morris. Imported and Established Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three years, at Chiswick.—59°.

ACTUAL TEMPERATURES:—

LONDON.—September 1: Max., 62°; Min., 48°.
PROVINCES.—September 1: Max., 65°; Min., 55°.

A FEW years ago a mysterious disease appeared on the Vines at Chiswick and elsewhere. At that time little or nothing was known of the real nature of the disease; but, shortly afterwards, some researches of MM. VIALA and SAUVAGEAU were made public, from which it appeared that the "browning" (*brunissure* of the French) was due to the presence of a slime-fungus, or myxomycete, closely related to that which produces "finger-and-toe" in the roots of Crucifers. Later researches of M. DEBRAY and others showed that the slime-fungus is by no means confined to the Vine, but occurs on plants belonging to many different natural orders, including Rosaceous fruit-trees, indeed that it may be considered as likely to invade any plant under favourable conditions.

M. E. ROZE, in the *Bulletin of the Mycological Society of France*, t. xiii., p. 154, recently published, gives further details of the nature and mode of growth of the parasite, which is henceforth to be known as *Pseudococcis vitis* of DEBRAY. ROZE detected its presence in the tubers, as well as in the leaves of the Potato; that the "plasmodies," or masses of protoplasm of which the fungus consists, might remain dormant in the tubers during the winter, to awaken to new life in the haulm and leaves in the following spring. The fungus was culti-

vated in various ways and on different plants by M. E. ROZE, who also succeeded in inoculating with the fungus several previously healthy plants.

Thus minute fragments of Potato infected with the disease were introduced by inoculation into the seeds of Lupins at the commencement of germination, and when the cotyledons were unfolded, blackish spots bordered with orange became visible, and, when examined microscopically, showed the plasmodies of the fungus. In other cases it sufficed simply to water the soil in which various seedlings were growing with water known to be contaminated by the fungus, although the effects were not there so rapidly apparent as in the case of direct inoculation.

In cultivating the fungus it was found necessary to subject it continuously to a moist atmosphere; for where the contrary condition prevails, the plasmodies do not make their way into the stem and leaves, but become encysted on the surface of the soil, forming cysts of an orange colour sufficiently large to be seen by the naked eye. The warmth and moisture of our vineries and forcing-houses, then, are conducive to the growth of the fungus, and M. ROZE even notes its existence in the Orchid-houses, where it attacked the foliage of various species of *Angreum*, *Calanthe*, *Cymbidium*, *Lycaste*, *Odontoglossum*, *Oncidium*, and *Phalaenopsis*.

Again, we frequently see cuttings of *Pelargoniums* after a time rot off from below upwards without appreciable cause. We have generally attributed the disease to too deep insertion of the cutting, or too deep planting when planted out. The observations of M. ROZE render it probable that this condition is sometimes due to the presence of a slime-fungus.

For the benefit of those of our readers desirous of investigating the disease for themselves, it may be pointed out that the plasmodies, otherwise difficult to see, are rendered visible by the agency of chloro-iodide of zinc, which brings out the characteristic orange colour of the plasmodies and its contents.

Our knowledge of the life-habits of the fungus is so imperfect that anything like a cure is not at present within our reach. As we have said, the conditions favourable for the development of the fungus are those which are also propitious to the Vine or other plant grown under glass. Destruction by fire of affected plants, or at least of the parts known to be affected, is the only thing that can be recommended with confidence. Possibly future experiments may reveal some means of killing the fungus without injury to the host-plant.

CATTLEYA WARSCIEWICZII "MRS. E. ASHWORTH."—Colour variations in *Cattleya Warscewiczii* of any importance are more rare than in any of the other large-flowered *Cattleyas*; and forms of the albino class, in which the colour is almost entirely suppressed, are extremely rare, and consequently very valuable. When we regard the frequency of such forms in *Cattleya labiata* *Trianaei* and other varieties of *C. labiata*, and the endless variation shown by it (which is so great as to render the flowers of very few of its representatives exactly alike), the circumstance is all the more remarkable and significant in regard to taking *C. Warscewiczii* out of the true *C. labiata* class in which some authorities have placed it. *Cattleya Warscewiczii* "Mrs. E. Ashworth" (fig. 47, p. 163), exhibited by ELLJAH ASHWORTH, Esq., of Harefield Hall, Wilmslow, Cheshire (gr., Mr. HOLBROOK), at the Royal Horticultural Society, July 27, 1897, when it received an Award of Merit, is one of the most beautiful of the forms of the species which have yet appeared, being entirely of a clear blush-white, or very

pale Peach-blossom tint, the only other colour in the flower being a soft yellow tinge at the base of the lip, and an almost imperceptible lilac-coloured spot on its front. This fine novelty was purchased some years ago with ordinary varieties of *C. Warscewiczii*, all freshly imported, by Messrs. JOHN COWAN & Co., of Liverpool.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the fruit and floral committees of the Horticultural Royal Society will be held on Tuesday, September 7, in the Drill Hall, James Street, Victoria Street, Westminster, from 1 to 5 P.M. A lecture on "Pitcher Plants" will be given by Mr. H. J. VITCH, F.L.S., at 3 o'clock.

JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY.—The August part of the *Journal of the Royal Horticultural Society* (vol. xxi., part i.), contains the official list of the Victoria Medallists, and reports of the various papers read before the Society since March last. Professor MARSHALL WARD's paper on the mode of cultivating and observing microscopic fungi is entitled "Microscopic Gardening." It is interesting, as showing the methods adopted by microscopists to identify the fungi and study their life-history. Some of the way-marks of modern progress are mentioned, which will be of great service to the student; thus, it was not until 1864 that DE BARY proved the penetration of the fungus-tube of *Phytophthora* into the Potato plant. Mr. WILLIS' paper on the employment of artificial manures is also full of interesting matter, important to all gardeners. An official list is given of varieties of Apples and other fruit which are for exhibition purposes to be considered as for dessert or for culinary use, as the case may be. The list is, of course, quite arbitrary, but for the sake of avoiding confusion it is desirable to have a standard list like that here given.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We have received the following letter from Mr. G. J. INGRAM, Secretary to this Institution:—

"The Committee, Treasurer, and Trustees acting on behalf of the members and subscribers of the above Institution, with the concurrence of its President, the Duke of Westminster, recently forwarded through the Home Secretary a loyal and dutiful address to the Queen, for forty-six years the gracious Patroness of the Charity, congratulating her Majesty on the completion of the sixtieth year of her beneficent reign, and I have now received the following reply from the Rt. Hon. Sir Matthew White Ridley, M.P.

COPY.

SECRETARY OF STATE. WHITEHALL, S.W.
HOME DEPARTMENT. August 24, 1897.

SIR,—I have had the honour to lay before the Queen the loyal and dutiful Address of the Gardeners' Royal Benevolent Institution, congratulating her Majesty on the completion of the sixtieth year of her reign, and I have to inform you that her Majesty was pleased to receive the same very graciously.

With reference to the application for permission to make use of the words: "Victorian Era" in connection with the title of a Fund now being raised by the Institution, I have to acquaint you that her Majesty graciously approves of the desired permission being granted.

I am, Sir, your obedient servant,
(Signed) M. W. RIDLEY.

G. J. INGRAM, Esq.,
Secretary to the Gardeners' Royal Benevolent
Institution, 50, Parliament Street, S.W.

MR. G. W. CUMMINS.—Many of our readers will learn with regret that this well-known Surrey gardener intends to relinquish his post at The Grange Gardens, Wallington, which he has filled to the satisfaction of his employer for a period of sixteen years. Both master and man have to deplore the death of their respective wives, and as Mr. CUMMINS tell us, "a gloom has apparently been hanging over the place," and he would like to obtain another appointment in a healthier locality, and where the land is better adapted for good gardening than that at The Grange. Mr. CUMMINS has been a successful cultivator of hardy fruits, Orchids, Ferns, and exotic plants generally.

CARNATIONS.—We have received some beautiful blooms of Carnations from Messrs. LAING & MATHER, Kelso-on-Tweed. They were cut from outside beds, and the quality of them is commendable. Besides

FIG. 47.—CATTLEYA WARSCEWICZII "MRS. E. ASHWORTH." (SEE P. 162.)

some well-known varieties of selfs and yellow-ground Picotees, a few of the newer ones are represented, and more than one promising seedling. We congratulate our North Country friends upon being able to gather such flowers from their borders at this date.

"KEW BULLETIN."—The last number of the *Kew Bulletin*, dated December, 1896, has only lately been issued. It completes the tenth volume, and the editor has availed himself of the opportunity to give a summary of the contents of the ten volumes. It is well known that Sir WILLIAM HOOKER, on being appointed Director in 1841, made it one of his chief objects to promote what is now called economic botany, and to aid in the development of the resources of the colonies. His relations with foreign and colonial botanists were exceptionally extensive and intimate. By their means he was enabled to establish the museum of economic botany, to inaugurate the series of colonial floras, and generally to lay the foundation and erect much of the superstructure which has rendered Kew the centre of economic botany. Sir JOSEPH HOOKER took up and extended his father's work. His extensive travels necessarily brought him into contact with colonial authorities, and his own unwearied labours enabled him, even in the midst of constant official duties, to produce monographs on the *Floras of New Zealand and Tasmania*, whilst it is but a few months since he brought the *Flora of British India* to a close. From the point of view of commercial botany, the most important development of recent years has been the establishment of "botanic stations" for the purpose of supplying trustworthy information on the culture of economic plants, and of facilitating the introduction or exchange of valuable plants. There are now nine such stations in the West Indies (the first dating from 1886), five on the West Coast of Africa, and one in Fiji. All or most of these are manned by gardeners trained and selected for the purpose at Kew. The considerable proportions that the colonial fruit trade has assumed are largely due to the initiative or to the suggestions from Kew. The rubber industry has been fostered, and in two years rubber was exported from Lagos to the extent of nearly £400,000. The scientific work of Kew has not been neglected, new plants have been described in large numbers in the *Bulletin*, and plant diseases have received much attention. An index to the ten volumes greatly facilitates reference, and serves to illustrate the activity that reigns at Kew in departments of which the great mass of the public know nothing.

"THE ASA GRAY BULLETIN."—We have received from the editor (Mr. GILBERT H. HICKS) a copy of this bi-monthly journal, which contains an illustrated article on "Passion Flowers" and other matter. We find in it notes on "Our Native Orchids," and various observations on botanical matters.

"MALADIES DES PLANTES AGRICOLES."—M. ED. PRILLIEUX has published, through Messrs. FIRMIN-DIDOT ET CIE. (WILLIAMS & NORWATE, London), the second volume of his treatise on the diseases of agricultural plants, fruit and forest trees. It is devoted to parasitic fungi, of which descriptions and illustrations are given. In this publication, as in most other French works of similar character, DUCHARTRIE is credited with having discovered the virtues of sulphur as a cure for Vine mildew. The date given is 1850. We have not the means of referring to DUCHARTRIE's paper, but we think it most probable the eminent French botanist took the suggestion from JOHN KYLE, the English gardener, who described his use of flowers-of-sulphur as an antidote to the Vine mildew (*Oidium Tuckeri*), in the *Gardeners' Chronicle* for July 22, 1848. Mr. BERKELEY, who described the fungus in these columns (see the issue for November 27, 1847), always credited KYLE with the discovery of the remedy. The synopsis of the genera given by M. PRILLIEUX will be very serviceable to the student who from any cause has a difficulty in referring to

larger and more detailed volumes. A table of contents and an index add greatly to the value of this excellent book, which we commend to the notice of our readers.

AGRICULTURAL RETURNS OF GREAT BRITAIN, AS REGARDS FARM CROPS, 1897.—The Board of Agriculture affords the following preliminary statement for 1897, compiled from the returns collected on June 4; and comparisons with previous years:—

Crops.	1897.	1896.	1895.	1894.
	Acres.	Acres.	Acres.	Acres.
Wheat	1,839,161	1,693,557	1,417,483	1,927,962
Barley	2,035,790	2,104,764	2,166,279	2,095,771
Oats	1,036,056	3,095,488	3,296,663	3,253,401
Potatoes	564,914	563,741	541,217	504,451
Hay from Clover and Rotation Grasses ...	2,286,261	3,171,066	2,303,431	2,121,991
Hay from Permanent Pasture	1,509,977	4,637,923	4,760,074	4,851,759
Hops	50,863	54,217	58,940	59,535

COMPARISONS WITH 1896 AND 1895.

Crops.	Increase.		Decrease.	
	Over 1896.	Over 1895.	Under 1896.	Under 1895.
	Acres.	Per ct.	Acres.	Per ct.
Wheat	195,204	11.5	471,678	33.5
Barley	68,974	3.3
Oats	39,432	1.9
Potatoes	58,827	10.4
Hay from Clover ...	114,295	5.3
Hay from Permanent Pasture	127,946	2.8
Hops	3,354	6.2

"THE RECORD OF THE ROYAL SOCIETY."—The Royal Society has published a small volume devoted to the record of its institution and history and to be considered as the complement of the *Year-books* recently issued. The information given herein is, avowedly, principally historical, and has been brought down to the present date. An account will be found in the Record of the Royal Society's various charters, statutes, benefactors, and trusts. Present members will be interested in the biographies and portraits of former Presidents and other officers of the Society. Among the more familiar names we notice those of Lord BROUNCKER, Sir JOSEPH WILLIAMSON, Sir CHRISTOPHER WREN, Sir JOHN HOCKINS, and SAMUEL PEPYS. This latter celebrity was elected President of the Royal Society in 1684, and remained in that office about two years.

ACREAGE OF HOPS.—A preliminary statement compiled from the returns collected on June 4, 1897, showing the acreage under Hops in each county of England in which Hops were grown, with a comparative statement for the years 1896, 1895, and 1894, will be found in the following table, supplied by the Board of Agriculture:—

COUNTIES.	1897.	1896.	1895.	1894.
	Acres.	Acres.	Acres.	Acres.
Berks	4	...	11
Gloucester	40	49	38	39
Hants	2,303	2,494	2,875	2,911
Hereford	6,542	6,895	7,553	7,525
Kent	31,661	33,300	35,018	35,520

LONGEVITY OF SEEDS.—Botanists, who have reason to revere the name of de Candolle, will read the following note with sympathy, not only for its intrinsic interest, but also as the production of one of the fourth generation of this famous botanical family. M. AUGUSTE DE CANDOLLE, who now writes to us, is

the great grandson of AUGUSTE PYRAMUS DE CANDOLLE, who died in 1841. "With reference to M. Ca. NAUDIN's paper on the longevity of seeds and their preservation in the earth, referred to in a recent number of the *Gardeners' Chronicle*, the following facts may be of interest. Some time ago, I was put in possession of some earth which had been dug up in Peru, near the Amazon River. Less than four days after the earth had been placed in two large germinating pans in a hothouse, a species of grass began to spring up, which proved to be *Eleusine indica*, Stead., and of which I subsequently counted over a hundred plants. I also detected *Vandellia crustacea*, Benth., a Spurge, and a species of *Verbenaceae*, perhaps new. These species all flowered and produced seed in due course. No doubt, with proper care, and had the *Eleusine* been kept down, many more distinct species might have been reared. *Aug. de Candolle, Geneva.*"

WHEAT CROP OF THE UNITED STATES.

The latest published returns forwarded to us from Washington may thus briefly be summarised:—The condition of winter Wheat (81.2) is 2.7 points higher than in June, and 5.6 points higher than in July of last year. The range is from 110 in the States of Maryland and Virginia, to 40 in Illinois. There are seven records of over 100 out of fifteen; the others range from 92 downwards. Spring Wheat condition is given at 91.2, or 1.6 points higher than in June, but 2.1 lower than in July of last year. The average condition of spring and winter Wheat combined (84.9) is 1.5 points higher than that of the corresponding period of last year. As to the condition of the crops at the close of July, the reporter says:—

"The average condition of spring and winter Wheat combined, 84.9, is 1.5 points higher than that of the corresponding period of last year. The reports with regard to winter Wheat in New York are, on the whole, excellent, the last month having been exceedingly favourable. From Pennsylvania they indicate a full normal crop. In Maryland the weather has been very favourable, and the crop prospects are very good. In Virginia the harvest is practically over, the crop has been secured in good condition, and so far as reported, it is of unusually good quality. In Kentucky the crop is said to be the best for years. In Ohio the crop has matured finely nearly all over the State, and the quality of the Wheat is reported as excellent. In Michigan the conditions have been less favourable, the entire stand being, with very few exceptions, thin on the ground. In Indiana the quality of the Wheat is said to be very fine, and promising a heavy average weight per bushel. Measured by bushels, however, it will not be more than two-thirds of an average crop. In Illinois an improvement during the month is reported, and the quality of the grain harvested promises to be very fine. In Missouri the crop has headed out better than was expected a month ago. In Kansas no material change of condition is reported. In Texas the weather conditions have been favourable, except quite locally. In California harvesting is now under full headway, the conditions having greatly improved during the month of June. In Washington and Oregon the conditions are greatly improved, but in the latter State more rain is needed to insure a normal yield.

"In regard to spring Wheat, the crop seems to have held its own in Wisconsin very well, notwithstanding unfavourable conditions. In Minnesota the conditions have been in the main unfavourable, but less so in the Red River valley than in other sections. The Iowa crop has been unfavourably affected by cold and dry weather. In Nebraska the conditions have been improved by recent rains, and are, on the whole, very good. The same is true in North Dakota."

THE MASSACHUSETTS HORTICULTURAL SOCIETY was incorporated in 1829 "for the purpose of encouraging and improving the science and practice of horticulture." The chief means by which this end has been sought are horticultural exhibitions, the library, and lectures and discussions on subjects connected with horticulture. Among these the library stands prominently as a source of scientific and practical information on horticulture, yet it is felt that the actual usefulness of the library is less than its possibilities. The library appears to have attained an extent and value exceeding that of any other horticultural library in this country, and excelled by few in the world. Though only members of the society can take out books for home use, all who desire are cordially invited and welcomed to consult its books in the library-room, and all such will find a great convenience in its central location—at Horticultural Hall, No. 101, Tremont Street, Boston.

METROPOLITAN PARKS AND OPEN SPACES.—The London County Council "Red Book" for the year 1896-97 was issued recently—the annual report of the General Purposes Committee. It has many interesting features, not the least being the action devoted to the caretaking of the public parks and open spaces during the past twelve months. From this we learn that the Parks' Committee exercise control over seventy-nine open spaces, with an acreage of 3,685, as against forty such spaces with an acreage of 2,656 inherited from the deceased Metropolitan Board of Works. The Committee has continued its beneficent survey of London with a view to further acquisition, as opportunities arise, to satisfy existing or prospective needs. The Council has, during the past year, assisted the acquisition of recreation grounds in poor and crowded districts—a wise assistance—this in Bermondsey, Walworth, Hoxton, and Islington. In the outlying and more favoured districts of Hampstead and Sydenham, open spaces which were threatened have been preserved, in view of the approach of bricks and mortar, and no doubt wisely. One would wish, it is stated, that the natural boundary of our county would be a belt of green spaces, providing ample ramparts of fresh air. Misapprehension of the committee's intention in regard to works on Hampstead Heath has probably been by this time allayed. Not a ruthless vandalism, but an æsthetic solicitude has prompted the committee to plant for the future, so as to preserve the picturesqueness of the present, while it has treated the gorse, says Dr. COLLINS, with a reserve worthy of LINNÆUS. It would be idle to follow the Reports into the works now being done in one or other of the parks, &c.; they are all taking to maitiation, pleasures, and health-giving recreation and amusement; and the youth of to-day are fortunate in being so earnestly and intelligently catered for in all that concerns physical and intellectual development.

VENTNOR UNDERCLIFF HORTICULTURAL SOCIETY.—The sixty-second show in connection with this Society was held on Wednesday, August 25, in Ventnor Park. Three large tents were filled with fruits, flowers, vegetables, and plants. The Isle of Wight Horticultural Improvement Association Certificate was awarded to Mr. A. RICHARDS, gr. to J. JESSOP, Esq., Bonchurch, for an exhibit of vegetables. The other principal prize-winners were Messrs. G. WITT, J. WOODS, S. COTTON, D. DAY, J. BASTININI, W. TAYLOR, W. HEATH, F. ATTRILL, SHREATH and NIBLETT. Messrs. PERD & SONS stage 1 some blooms of Gloxinias and Tuberous Begonias and leaves of Caladium.

THE ENGLISH ARBORICULTURAL SOCIETY HELD THEIR ANNUAL MEETING AT LYNN.—This Society was founded at Hexham in 1880, with about half-a-dozen subscribers. The number has yearly increased, and it has now upon its roll something like 420, with headquarters at Haydon Bridge, Northumberland. Its object is to promote the cultivation of trees and shrubs. Mr. F. W. BEADON is president and Mr. JOHN DAVIDSON, secretary and treasurer. On Wednesday, August 18, a journey was made to Castle Rising Hall, the seat of Sir HORACE FARQUHAR, M.P., and thence to the Sandringham estate of the PALACE OF WALES, who provided the party with luncheon in the splendid club-room at Wolferton, which his Royal Highness has provided for the benefit of the inhabitants. A long time was spent in inspecting the trees. In some respects, owing to the inclement weather, the visit was disappointing. Upon leaving Sandringham, a drive was taken to Houghton, the property of the Marquis of CHOULMONT, where the party was deeply interested in the magnificent avenues of Beeches, and in several remarkably fine specimens of Cedars of Lebanon. Lord DE GREY AND WILTON provided tea for them. The annual dinner at night at the Globe Hotel, Lynn, proved a very happy and social reunion. On Thursday, when the weather was perfect, the excursionists went to Holkham Hall by the kindness of the Right Hon. the Earl of LICHFELD, K.G., Lord Lieutenant of

Norfolk. This trip was almost exclusively one of business, and was much enjoyed. A luncheon was provided by his lordship for the party. The last day of the session (Friday)—another showery day—was devoted to Melton Constable, the seat of Lord HASTINGS. Several places have been suggested for next year's meeting, and Balmoral appears to be the most favoured. *Times*.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY'S SHOW, SEPTEMBER 8 AND 9.—This important event, as we learn at the moment of going to press, is likely to be one of the finest displays ever seen in the Waverley Market, the Jubilee Prizes exciting keen competition among exhibitors from all parts of the kingdom.

PUBLICATIONS RECEIVED.—*Favourite Flowers of Garden and Greenhouse*. The 49th number of this reprint is now ready.—*Dictionnaire d'Horticulture et de Jardinage*. This has now reached the word "Schizocasia."—*Annales Agronomiques*, 25th Juillet.—*Le Chrysanthème*, Journal de la Société Française des Chrysanthémistes, August 1.—*Buletino della R. Soc. Toscana di Orticultura*, July.—*Die Botanischen Institute der freien und Hansestädte Hamburg*, Von Dr. A. VOIGT.—*Die natürlichen Pflanzenfamilien*, Supplement and Index to part ii.—iv.—*Transactions of the Massachusetts Horticultural Society for 1896*, Part II.—*Meehan's Monthly*, August, contains articles on *Pentstemon barbatus* and horticultural subjects generally.—*The Botanical Gazette*, June (Chicago, Ill.), contains: "Further Observations on the Myxobacteriaceæ," by ROLAND THAXTER; "Life History of *Lilium Philadelphicum*," J. M. COULTER; "Pollen Tubes of *Zamia*," H. J. WEBBER, all finely illustrated, and various notes and reviews.—*The Botanical Gazette*, July, contains: "Notes on Zygomycetes, Syncephalastrum, and Syncephalia," R. THAXTER; "Development of the Antherozoids of *Zamia*," H. J. WEBBER; "Mexican Fungi," E. HOLWAY; "Movements of Diatoms," W. M. KOZLOWSKI; and briefer articles.—*Transactions of the Massachusetts Horticultural Society for 1895*, Part III., being a list of accessions to the library during the year.—*The Forester* (Princeton, New Jersey, August).—*Bulletins from the United States Department of Agriculture*. Division of Entomology: The Use of Steam Apparatus for Spraying, L. O. HOWARD; The Asparagus Beetle, F. H. CHITTENDEN; Insect Control in California, C. L. MARLATT; The San José Scale—T. COCKERELL. Division of Soils:—Electrical Method of Determining the Temperature of Soils—MILTON WHITNEY and LYMAN J. BRIGGS; and Electrical Method of Determining the Soluble Salt-contents of Soils—MILTON WHITNEY and THOS. MEANS.—*Sooty Mould of the Orange and its Treatment*, by H. J. WEBBER. A most carefully written and illustrated Bulletin (No. 13) on this pest, issued from the U.S. Department of Agriculture.—*Cassell's Saturday Journal*. The holiday number is a double one, and contains an unusual amount of attractive literature.—*The World of Adventure* (Cassell & Co., London, Paris and Melbourne). The new penny issue of this thrilling periodical will be appreciated by all boy-readers.—*Journal of the Horticultural Society*, Vol. XXI., Part 1, August.—*Favourite Flowers of Garden and Greenhouse* (FREDERICK WARNE & Co., Bedford Street, Strand), Vol. IV., Nos. 51 and 52.

HOME CORRESPONDENCE.

RARE CONIFERS.—I was delighted to find, amongst hosts of uncommon trees and shrubs, at Emmetts, Ide Hill, Sevenoaks, the newly-acquired and charmingly situated estate of F. Lubbock, Esq., two Conifers, fully developed specimens of which I had not seen before. These were the upright Silver Fir (*Abies pectinata fastigiata*), and the inverted branched spruce (*Picea excelsa inverta*), the former about 45 feet, and the latter fully 30 feet high. Many little-known forms of coniferous trees are looked upon as monstrosities, and particularly so

those in question; but if I am favoured with and you will reproduce the illustrations of those that I have been promised, your readers will agree with me that both are well worthy of being cultivated. It is very interesting to find such rare conifers in little known and out-of-the-way places, but, as I have before pointed out, this is the rule and not the exception with coniferous trees. I saw the Japanese Yew (*Cephalotaxus pedunculata*) growing well by the lake margin, amongst many other uncommon Conifers, at Trentham, thus confirming what I have before pointed out, that a still, damp atmosphere is conducive to its well being. A. D. Webster.

ENGINEERS AND SURVEYORS AS GARDENERS.—In the *Contract Journal* for August 11, I notice that the body known as the "Incorporated Association of Municipal and County Engineers," has been holding its annual meeting in London this year, when, as usual, it discussed subjects within and without its own province. The municipal engineer has—or ought to have—plenty to occupy his mind in his own sphere, without attending to matters which should be dealt with by members of a different profession. I am afraid these gentlemen, as a rule, are inclined to believe that everything connected with a municipality should be under their entire supervision and management, and they would make themselves responsible for more than they could attend to. These opinions are strengthened by reading in the above-mentioned journal one of the papers which the members of the Association are reported to have listened to during the meeting then held. The paper is entitled "The Laying-out of Parks, Recreation-Grounds, and Open Spaces," which, as may be imagined, when delivered in connection with an Engineers' Association, is a very poor attempt indeed. The old axioms, such as "No two walks should run parallel with one another," "For every curve there should be some apparent reason," are trotted out as if only now discovered. Nurserymen are indicated as being opinionated in regard to the planting and growing of trees, and the "author" gives them several lessons, which, it is to be hoped, will benefit them. Why do city engineers, as a body, regard themselves as landscape gardeners? Is it because they believe it to be an art in common with the making of roads, sewers, and such like, or is it because they are of opinion that it is a phase of surveying? Whatever the reason, the sooner they give up these ideas, and leave the laying out of public parks to men who are better qualified to do it, the better it will be for the general public, and the reputation of city engineers in general. All that any engineer has a right to do with the laying out of a public park is simply in marking off the boundary, and executing the erection of any railing or buildings that may be required. As to the position and form of walks, or the kinds of trees, shrubs, &c., to be used, such matters should be left to the landscape gardener, who, being familiar with this work, and with the trees, is the right individual to carry out such work. *Practical*.

TROPICAL FRUITS.—It is surprising we do not see more tropical fruits in the markets. What would attract more attention at large dinner-parties during Christmas-time than a dish of Custard Apples or Avocado Pears? They would add the variety and change so much needed, the flavour is so unlike that of our own native fruits. The two fruits mentioned I can recommend as being very palatable. The Melon-Pear, frequently seen two or three years since, has not gained favour in this country. The Loquat (*Eriobotrya japonica*) I am not acquainted with. I had a large plant, but was not successful in fruiting it. I should be interested to know if it has produced edible fruits in this country [often]. W. H. Clarke, Wellington, Somerset.

MUSCAT OF ALEXANDRIA GRAPES AT SHREWSBURY SHOW.—I think the following particulars will be of interest to some growers of Grapes, more especially of the Muscat of Alexandria. The bunches of this variety that obtained the 1st prize at the show, were taken from Vines not cultivated in the ordinary manner, and Mr. Neild, the Curator of the Cheshire Horticultural College, who exhibited them, informed me that the eyes were put in during March, 1896, and after becoming well-rooted, they were planted in the vine-border. These Vines made very strong growth, and had covered the roof and back wall by the autumn. The rods were cut back in the winter to about 3 feet in height, and this season each one was allowed to carry one bunch, which came to about the same size in each case as those that were shown at Shrewsbury,

viz., 4½ lb. to 4½ lb. each. Considering that only eighteen months have elapsed since the eyes were put in, I think this is a very unusual feat in Vine culture. The Vines have made exceedingly strong growth, and give great promise for another year. *J. R.*

THE PARSLEY-LEAVED BRAMBLE.—Your correspondent, "A. D.," does not give this useful variety its due amount of praise. I have grown it for years on the poorest sandy ground, which is almost useless for anything else, the roots being, however, heavily mulched every winter, and every year the plants have borne an enormous crop of fruit; in fact, it is for the space it occupies the most valuable fruit that I grow. The best bearing row is on a trellis 8 feet high, running east and west; the heaviest crop is naturally on the south side—but the north, which gets no sun, bears and ripens a good crop also. Of all the fruits we grow it is the only one which has never failed, whatever the character of the weather. The present is perhaps the worst fruit year we have ever had, but the Parsley-leaved Bramble bears, as usual, an enormous crop. Any of your readers who are near me would do well to see the result obtained on nearly useless land. I have counted forty-eight good large berries in a single cluster. *Thos. Fletcher, Grappenhall, Cheshire.*

MR. HARRISON WEIR AND HIS GARDEN.—It is all very well to advise, but, as a rule the only garden worthy of the name is that which has been a garden for at least a generation. Some fifty years ago, when I was a small boy, I commenced operations with a Potato, which I rooted up every few days to see how it was getting on. This, of course, proved a failure, and unfortunately discouraged me for a time. Learning by experience, results became more satisfactory, but still, for a time they were not much better. I had not learnt the value of patience, and that takes a long time to learn. The first thing is to find a suitable spot, and this is not easy. The best man in the world is hampered if he can only get a flat field with a barbed-wire fence; the place must be ready made for him, the trees must be of good size, and he must succeed someone else. Few gardens can be made in a lifetime, and in any case, a good deal of knowledge is required. Given an old crooked garden, all ups and downs, or as an acquaintance puts it, "very unflat," much can be done; but neither Mr. Harrison Weir nor anyone else could have made such a place as is shown in the photograph, unless his predecessor had planted trees, and Nature provided crooked places and big stones. A collection of fowls can be got together in a year, but a collection of fine trees is the work of a lifetime. One of the worst features of the some fashionable gardens is the bedding-out, which leaves the flower-garden bare and miserable-looking for half the year; it is much better to arrange the beds so that they are never without something of interest. As a basis for this the old-fashioned border of herbaceous perennials is necessary, with spaces between where annuals and half-hardy plants can be sown or planted, and the ground may be largely planted with bulbs, which grow and die away at various seasons, and are let alone year after year. As truly stated in the *Gardeners' Chronicle*, some weeds are desirable, and such native plants as Foxgloves, wild Roses, to grow wild in the hedges, Harebells, Geraniums, Blackberries, Bulrushes, even fungi on rotten tree-roots, and that abominable weed, the wild Convolvulus, if kept down with a strong hand, all add a charm, in their proper places. In the general arrangement of the garden, certain points are necessary: for instance, the entire garden should not be in sight from any one point; the variety of the plants grown should be as great as possible; and last, but not least, every day in the year, without exception, there should be something of interest for all comers, and good flowers be also always available. This means, of course, some amount of glass, but very little of this is really needed. *Thos. Fletcher, Grappenhall, Cheshire.*

WATER-WEED.—In answer to an enquiry by "Lexden" as to the best means of destroying Potamogeton and other such weeds in a lake, allow me to say that if he will get a pair of swans early next year, he will find that Potamogeton at least will never again reach the surface of the water. Swans will eat many water-plants, but not Polygonum amphibium, one of the most difficult of water-pests to get rid of. *R. Irwin Lynch.*

THE MIRABELLE PLUM (*versus* PRUNUS MYROBALANA).—In the admirable lecture on Plums delivered by Mr. Pearson at the meeting of the Royal Horticultural Society on August 24, allusion

was frequently made to these Plums in regard to their suitability for stocks, &c. Some confusion seems to exist as to what is meant when the Mirabelle or Myrobalana are named, the lecturer seeming to consider them one and the same, whereas they are as distinct as two Plums can well be. The former—the Mirabelle—is a small round early yellow Plum, very useful for cooking purposes. It is not much grown in this country; why, I do not know. In France it is much esteemed. I have seen it at Ferrières grown in pots and laden with fruit. As a stock for the Plum this Mirabelle is, in fact, not used, and does not appear suitable. In Dr. Hogg's *Fruit Manual* it is correctly described, the following synonyms, Mirabelle blanche, Mirabelle jaune, Mirabelle Perle, Mirabelle Petite, Mirabelle Vicuna being given. With regard to the Prunus Myrobalana: this is not grown usually in this country as a fruit tree, but as a stock for the Plum, as an ornamental flowering tree, and as a hedgerow plant. It is one of the earliest trees to blossom, being frequently in full bloom in the end of January. Owing, no doubt, to this early flowering, it seldom bears fruit, although I have flowered trees of this Plum for nearly half a century; and fifty fruits would about represent the total crop for the whole of that period. The fruit is below medium size, roundish, with a nipple at the apex, skin pale red, flesh pale, acid, adhering to the stone, stalk long, slender, like a Cherry. A very poor cropper. A very good description of it is given in the *Fruit Manual*, in which it is stated that it may be used more in the dessert as an ornamental variety than for its flavour. The following synonyms may be noted—Cherry, Early Scarlet, Mezer Plum, Virginian Cherry. *A. P. B.* [In some parts of Kent Prunus Myrobalana is fruiting heavily this year, whilst other Plums are very scarce. *ED*]

A SOUTHERN COUNTIES CARNATION SOCIETY.—"An Old Florist" is evidently endowed with the same quality that quasi-clairvoyants habitually have, viz., inaccuracy. Moreover, as is usual with such extremely 'cute critics, he hides his identity under anonymity and endeavours to besmirch a gentleman whose only wish is to make the above society a success, irrespective of pecuniary considerations. Veiled correspondents should take the trouble to make enquiries before making just aspersions, and those of the "Old Florist" type ought to have learned, at their time of life, that now and again it is possible to meet with those who take an interest in matters without having sordid motives. Your correspondent, "A. D.," on the other hand, writes a reasonable and sensible letter in regard to the society, and perhaps it would be well if his suggestions were given consideration. *E. P. Westlake, Southampton, August 31.*

—When a correspondent writes simply to air his opinions, there may be some excuse for writing anonymously, but in personal remarks, such as those of "An Old Florist," I think it mean and cowardly so to do. Perhaps his letter and private opinion may be a little at variance. I will not intrude upon your valuable space by attempting to prove or deny what may be said for or against the formation of the Southern Counties Carnation Society, further than to state there is an increasing desire amongst the admirers of the Carnation as an object of special culture in Hampshire, the Isle of Wight, and adjoining counties that such a Society should exist, as the climatic conditions in these parts prevent our exhibitors competing on equal terms with their northern and midland friends at the London and other shows. However, I let the opinion, which "Old Florist" so knowingly declares, pass for what your readers may think it is worth, but when his letter "reveals" such an unwarrantable and personal attack, I think it is high time to protest; and I must, in justice to myself, ask you to favour me by the insertion of this letter. Whether the writer has wilfully omitted the word *gratis* in his quotation from my circular I cannot say, but if not a wilful, it is a serious omission. Before the writer ventures to express his "altered suspicion," or "presume" (as a matter of course) that good must be evil, it would be well for him to ascertain something of the standing and *bona fides* of the person he accuses of interested motives and trade tricks. For the rest allow me to say, as one of the originators of the Society, that I have come forward, at considerable expenditure of time, &c., to foster and develop the popularity of the Carnation in the south of England; and what I have offered in the way of encouragement is to give and not to sell for personal benefit, either in the present or future; and I, therefore, utterly disclaim

the unworthy imputations which "An Old Florist" makes against me. *Wm. Garton, Jun., Argyll House, Woolston, Hants, August 31, 1897.*

—"An Old Florist" (on p. 148 of the *Gard. Chron.*) is hardly just to the proposal to form a South of England Carnation Society. Why, if there be about the suggestion something of an advertising element, is it any worse than is seen in traders offering prizes to customers as inducements to purchase seeds. What would be the much-vaunted co-operative exhibition were it not a large trade advertisement? Has not the Royal Horticultural Society for many years held out to possible Fellows the bait of an annual distribution of plants? and does not even "An Old Florist" complain that the National Carnation Society tempts members by promises of packets of seed? Surely Mr. Garton, of whom I know nothing, but had imagined to be a gentleman amateur, is not worse, and every bit as good as others. And why should not the formation of provincial societies lead to the wider culture of the Carnation? Is not the "National" after all a home counties' show, and the Northern Society very much a northern counties' show? Why then not a southern one if there be found a sufficient number of amateur growers to form one? We might as well say that with the existence of the Royal Horticultural Society, there is no need for the existence of provincial horticultural societies. I say of them, the more the merrier, so long as they have a *raison d'être* for their existence, and can by their operations show they are filling a void, and rendering good service to Carnation culture. *A. D.*

A FINE BUNCH OF BANANAS.

Our illustration (fig. 48, p. 167) shows a bunch of Bananas grown in the gardens at Sherwood Park, Tunbridge Wells, the residence of Lady Siemens. The fruit was considered to be a very fine specimen, the variety being Musa Cavendishi. It contained 275 fingers, or pods, one of twin-shape weighed 13 oz., while one other of the ordinary growth turned the scale at 10 oz. The bunch of fruit, as a whole, when cut from the plant, weighed over 105 lb., and the fruits were of the finest quality. The length of the bunch from the top finger, or pod, to the bottom one, measured 4 feet 5 inches; length with stem and fruit, 5 feet 6 inches; the height of the trunk of the plant was 7 feet, and that of the leaves 8 feet. The plant was grown in a border 4 feet wide, 2 feet deep, with a flow and return-pipe for bottom-heat. The soil is old pasture-loam of a rather sandy nature. The plant was fed during its period of growth with farmyard liquid-manure, and with several top-dressings of Thomson's Vine and Plant Manure forked into the soil, followed with an application of water. The temperature of the house in the winter months ranged from 65° to 70°, and in summer, 70° to 85°, with abundance of moisture. For many years Bananas have been very successfully cultivated at Sherwood Park, and about sixteen years ago a fruit was exhibited at the Royal Horticultural Society's show in London, which attracted much attention in horticultural and other circles, its weight being 74 lb. Bananas are never planted at Sherwood except when the sucker comes up out of place, and the border has not been entirely renewed since its first formation about twenty years ago. *D. McKenzie.*

BRITISH ASSOCIATION.

(Continued from p. 149.)

SECTION K.—BOTANY.

Professor H. Marshall Ward, Sc.D., F.R.S., delivered his presidential address, which was exceedingly long and technical. He said:—

The competent historian of our branch of science will have no lack of materials when he comes to review the progress of botany during the latter half of the Victorian reign. The task of doing justice to the work in phanerogamic botany alone, under the leadership of men like Hooker, Asa Gray, Mueller, Engler, Warming, and the army of systematists so busily shifting the frontiers of the various natural groups of flowering plants, will need able hands for satisfactory treatment. A mere sketch of the influence of Kew, the principal centre of systematic botany, and of the active contingents of Indian and colonial botanists working under its inspiration, will alone require an important chapter, and it will need full knowledge and a wide vision to avoid inadequacy of treatment of its powerful stimulus on all depart-

ments of post-Darwinian botany. The *Genera Plantarum*, the *Flora of India*, suffice to remind us of the prestige of England in systematic botany, and the influence of the large and growing library of local and colonial floras we owe to the labours of Bentham, Trimen, Clarke, Oliver, Baker, Hemslay, Brandis, King, Gamble, Balfour, and the present Director of Kew, is more than merely Imperial. The progress in Europe and America of the other departments of botany has been no less remarkable, and, indeed, histology and anatomy, comparative morphology, and the physiology and pathology of plants have perhaps been advanced even more rapidly because the ground was newer. In England the work done at Cam ridge, South Kensington, and elsewhere, and the publication in the *Annals of Botany*, and other journals, sufficiently bear witness to this.

for priority are apt to accompany these subdivisions of labour; and those of us who are most intimately concerned with the teaching of botany will do well to take heed of these signs of our times, and distinguish between the healthy specialization inevitably due to the sheer weight and magnitude of our subject, and that incident on other movements and arising from other causes. The teaching and training in a university or school need not be narrow because its research laboratories are famous for special work. One powerful cause of modern specialization is utility. The development of industries like brewing, dyeing, forestry, agriculture, with their special demands on botany, shows one phase; the progress of bacteriology, palaeontology, pathology, economic and geographical botany, all asking special questions, suggests another. In each case men are encouraged to go

cell-division, and growth; the Bryophyta and pteridophyta are, on the other hand, the domain of the morphologist concerned with academic questions, such as the alternation of generations and the evolution of the higher plants.

Fungi and phanerogams, while equally or even more employed by specialists in morphology and physiology, appeal widely to general interests, and evidently on the ground of utility. Without saying that this enhances the importance of other groups, it certainly does induce scientific attention to them. I need hardly say that comparisons of the kind I am making, invidious though they may appear, in no way imply detracting from the highest honour deservedly paid to men who, like Thuret, Schmitz, and Thwaites in the past, and Bornet, Wille, and Kleve in the present, have done and are doing so much to advance our academical knowledge of the Algae; and Kleve's recent masterpiece of sustained physiological work, indeed, promises to be one of the most fruitful contributions to the study of variation that even this century has produced. Nor must we in England forget Farmer's work on *Ascomycellum*, and on the nuclei and cell-divisions of *Hepaticae*; and while Bower and Campbell have laid bare by their indefatigable labours the histological details of the mosses and vascular cryptogams, and carried the questions of alternation of generations and the evolution of these plants so far that it would almost seem little remains to be done with Hoffmeister's brilliant conception but to ask whether it is leading us, the genetic relationships have become so clear, even to the details, that the recent discovery by Ikeno and Hirao of sporangiospores in the pollen tubes of Cycas and Ginkgo almost loses its power of surprising us, because the facts fit in so well with what was already taught us by these and other workers. It is impossible to over-estimate the importance of these comparative studies, not only of the recent vascular cryptogams, but also of the fossil pteridophyta, which, in the hands of Williamson, Scott, and Seward, are yielding at every turn new building stones and explanatory charts of the edifice of evolution on the lines laid down by Darwin. All these matters, however, serve to prove my present contention, that the groups referred to do not much concern the general public; whereas, on turning to the fungi and phanerogams, we find quite a different state of affairs.

It is very significant that a group like the fungi should have attracted so much scientific attention, and aroused popular interest at the same time. In addition to their importance from more academical points of view the fungi appeal to wider interests on many grounds, but especially on that of utility. The fact that fungi affect our lives directly has been driven home, and whether as poisons or foods, destructive moulds or fermentation agents, parasitic mildews or disease germs, they occupy more of public interest than all other cryptogams together, the flowering plants alone rivaling them in this respect.

UTILITARIAN BOTANY.

A marked feature of the period we live in will be great advances made in our knowledge of the uses of plants. Of, course, this development of economic botany has gone hand in hand with the progress of geographical botany and the extension of our planting and other interests in the colonies, but the useful applications of botany to the processes of home industries are increasing also. The information acquired by travellers exploring new countries, by orchid-collectors, prospectors for new fibres or india-rubber, or resulting from the experiences of planters, foresters, and observant people, living abroad, has a value in money which does not here concern us; but it has also a value to science, for the facts collected the specimens brought home, the processes observed, the results of analyses, the suggestions gathered—in short, the puzzles propounded by these wanderers—all stimulate research, and so have a value not to be expressed in terms of money. The two react mutually, and I am convinced that the stimulus of the questions asked by commerce of botanical science has had, and is having, an important effect in promoting its advance. The best proof to be given of the converse—that botany is really useful to commerce—is afforded by the ever-increasing demands for answers to the questions of the practical man. At the risk of touching the sensibilities of those who maintain that a University should regard only the purely academical aspects of a science, I propose to discuss some cases where the reciprocal influences of applied, or useful, and purely academic, or useless botany—useless, because no use has yet been made of it, as some one has wittily put it—have resulted in gain to both. In doing this I wish to clearly state my conviction that no scientific man should be guided or restricted in his investigations by any considerations whatever as to the commercial or money value of his results—to patent a method of cultivating a bacillus, to keep secret the composition of a nutritive medium, to withhold any evidence, is anti-scientific, for by the nature of the case it is calculated to prevent improvement—i.e., to impede progress. It is not implied that there is anything intrinsically wrong in protecting a discovery—all I urge is that it is opposed to the scientific spirit. But the fact that a scientific discovery is found to have a commercial value also—for instance, Wehmer's discovery that the mould fungus, *Citroyomyces*, will convert 50 per cent. of the sugar in a saccharine solution to the commercially valuable citric acid, or Matruchet's success in germinating the spores of the Mushroom, and in sending pure cultures of that valuable agaric into the market—is no argument against the scientific value of the research. There are in agriculture, forestry, and commerce generally, innumerable and important questions for solution, the investigation of which will ne-

FIG. 48.—BUNCH OF BANANAS GROWN IN LADY SIEMENS' GARDEN, SHERWOOD PARK, TUNBRIDGE WELLS. (SEE P. 166.)

A consequence has been the specialization which must soon be openly recognised—as it already is tacitly—in botany as in zoological and other branches of science. No note has been more clearly sounded than this during the past twenty-five years, as is evident to all who have seen the origin, rise, and progress of our modern laboratories, special journals, and even the gradual subdivisions of this association. We may deplore this, as some deplore the departure of the days when a naturalist was expected to teach geology, zoology, and botany as a matter of course; but the inevitable must come. Already the establishment of bacteriological laboratories and a huge special literature of symo-technical laboratories and courses on the study of yeast and mould fungi, of agricultural stations, forestry and dairy schools, and so on—all these are signs of the inexorable results of progress. There are disadvantages, as the various *Cent abidder* and special journals show; for hurried work and feverish contentions

more and more deeply into the particular problems raised. Identification of flowers in Egyptian tombs, of pieces of wood in Roman excavations, the sorting of hay-grasses for analysis, or seeds in the warehouses; the special classifications of seedlings used by foresters, or of trees in winters, and so on, all afford examples. It is carried far, as witness the immense labour it is found worth while for experts to devote to the microscopic analysis of seeds and fruit; liable to adulteration, or to the recognition of the markings in imprints of fossil leaves, or of characters like leaf-scars, bud-scales, lenticels, and so on, by which trees may be determined even from bits of twigs.

If we look at the great groups of plants from a broad point of view, it is remarkable that the fungi and the phanerogams occupy public attention on quite other grounds than do the algae, mosses, and Ferns. Algae are especially a physiologists' group, employed in questions on nutrition, reproduction,

all the powers of careful observation, industrious recording, and thoughtful deduction of which a scientific man is capable. But while I emphatically regard these and similar problems as worthy the attention of botanists, and recognize frankly their commercial importance, I want to carefully and distinctly warn all my hearers against supposing that their solution should be attempted simply because they have a commercial value. It is because they are so full of promise as scientific problems that I think it no valid argument against their importance to theoretical science that they have been suggested in practice. In all these matters it seems to me we should recognize that practical men are doing us a service in setting questions, because they set them definitely. In the attempt to solve these problems we may be sure science will gain, and if commerce gains also, so much the better for commerce, and indirectly for us. But that is not the same thing as directly interesting ourselves in the commercial value of the answer. This is not our function and our advice and researches are the more valuable to commerce the less we are concerned with it. It is clear that the magnitude of the subject referred to is far beyond the measure of our purpose to-day, and I shall restrict myself to a short review of some advances in our knowledge of the fungi made during the last three decades. Professor Ward then proceeded to show, in somewhat minute detail, the bearing of these researches on fungi in various industries, as brewing, butter-making, cheese-making, forestry, &c.

Among the papers which have been read in the Botanical Section were several relating to forestry in Canada and the United States.

Mr. G. P. Hughes gave a description and measurement of Coniferous trees, grown from Yosemite Valley seed, conveyed by the author in 1874, and cultivated in England. The description of these Conifers tends to show that most of the Californian and British Columbian species thrive well on congenial soil and stations in Great Britain, and that as trees of ornament, shelter, and commercial value, they are well worth cultivating. Californian and British Columbian Redwood now produced 12. 11d. per cubic foot in the English market, yellow Pine, 2s. 6d.; Pitch Pine, 1s. 6d. per cubic foot.

FUNGUS.

Prof. ssor Marshall Ward, the President of the section, read a paper on "Stereum hirsutum, a Wood-destroying Fungus." He has cultivated this fungus from the spores, on sterilized wood blocks, and has not only obtained very vigorous pure cultures, and traced the action of the mycelium week by week on the elements of the wood, but has obtained spore bearing hymenae, and worked out the life-history very completely. The fertile hymenium arises in about three to four months. In destroying the wood the fungus delignifies the inner layer of the walls of the wood-elements, and in three months' cultures and upwards these turn blue in chlorzinc-iodine, and are shown by other re-agents to undergo alteration to cellulose-like bodies before their final consumption by the fungus.

Mr. Harold Wager discussed the nucleus of the yeast plant. Mr. W. G. P. Ellis described a disease of Tomatos. From diseased Tomatos received in August, 1896, from Jersey, the associated fungi and bacteria were isolated and cultivated on nutrient gelatine, and the mycelium was traced in sections of the fruits. On removing the first skin with carefully sterilized instruments the mycelium within the fruit formed in a short time the well-known sporangio-phores of Mucor stolonifer. Though late in the season (August 31, 1896), infection of some plants at the University Botanic Gardens, Cambridge, from pure cultures caused a disease resembling that of the fruits received in August and September from the grower. Experiments are in progress to determine (1) whether the fungi obtained, other than Mucor stolonifer, cause disease, and (2) the site of infection.

PRESERVATION OF VEGETABLE SPECIMENS.

The report of the committee appointed to report on the best means of preserving vegetable specimens for exhibitions in museums was presented. The committee since presenting their interim report have continued their inquiries and investigations, the result having been largely to confirm the statements already presented. Thus for preserving specimens in a liquid medium, alcohol on the whole yields the best results, in spite of its discolourizing action. Rapid killing and in some cases special methods of bleaching the specimens before immersion in the alcohol are additional precautions which it is desirable to observe. For bulky objects, or for others in which fluidity occasions no disadvantage, formalin may be used in 5 per cent. to 15 per cent. of the commercial solution. No better methods of mounting specimens for exhibition purposes have been devised than those in use in the Museum of the Royal Botanical Gardens in Edinburgh, an account of which is included in the interim report already referred to.

THE HYGROSCOPE.

Mr. Francis Darwin gave a preliminary account of a new method of investigating the behaviour of stomata. The method resembled in principle Stahl's cobalt test, inasmuch as it only indirectly indicated the condition of the stomata. The instrument made use of was a hygroscope, depending for its action on the extreme sensitiveness to watery vapour of certain substances. The best material consisted of thin sheets of horn treated in a special manner, and known as "Chinese sensitive leaf." When this membrane was placed on a damp surface it instantly curved with the concavity away from the source of moisture. If one end of a strip of the material was fixed to the lower surface of a block of cork, and placed on the stomatal face of a leaf, it was clear that only the free end could rise. It was on this principle that the hygroscope was constructed, the angle to which the hygroscope tongue rose being a rough indication of the degree of transpiration. Thus, on a leaf having stomata only below, the index of the hygroscope remained at zero on the upper surface of the leaf, while on the lower side it instantly

rose to an angle varying with the condition of the stomata. If they were widely open, the angle would be 30° or 40° to a horizontal line; if closed, the reading would be zero on both surfaces of the leaf. With this instrument a number of well-known facts in the physiology of the stomata could be easily demonstrated.

CROSS-FERTILISATION OF PLANTS.

Mr. William Saunders, Director of the Dominion experimental-farms, gave a most interesting account of the results achieved in experiments in the cross-fertilisation of plants, trees and shrubs. The work included experiments with varieties of the Gooseberry, Red and White Currant, Black Currant, Raspberry, Blackberry, Grape, Apple, Pear, Plum, Cherry, and Peach, also with different sorts of Wheat, Barley, Oats, Peas, and Rye, and with several species of wild flowers and ornamental shrubs. Among the most interesting results obtained with fruits were mentioned a hybrid between the Black Currant and Gooseberry, which strikingly shows the influence of both parents; a valuable yellowish-green Grape, known as Kensington, which is a cross between Clinton and Buckland's Sweetwater; several dark-purple Raspberries, produced by crossing the Black and the Red Raspberry; a large number of Seedling Apples, crosses between the Siberian Crab and the hardiest of the cultivated Apples; and a hybrid between the Sand-Cherry and a cultivated Plum. This latter hybrid and the crosses with the Apple are expected to give very hardy trees suitable for growing in the North-West Territories. Some very promising new varieties of Wheat have been produced by crossing Ladoga with Red and White Fife. One of these, known as Preston, ripens earlier than Red Fife, and in the tests of last season stood ahead of that variety and of all others in productiveness. Very distinct hybrids between two-rowed and six-rowed Barley have been produced, some of which may prove commercially valuable. In ornamental shrubs an interesting hybrid was obtained between two species of Barberry, the resulting shrub showing clearly the effects of the cross in the flowers, fruit, leaves, and general habit.

In the afternoon Mr. A. C. Seward gave a lecture on fossil plants.

ON GROWING PARSLEY FOR WINTER USE.

It is important to have a constant supply of fresh green Parsley throughout the year, but more especially is this useful plant in greatest demand in winter, when a supply cannot be maintained without considerable care and attention.

Some varieties are more susceptible to cold than others, therefore it is necessary to have seed from a good strain.

Parsley for the winter supply is grown in various ways, but the best result I have seen followed the method I will now endeavour to describe. It is recommended to sow the seed in the month of May, in drills 12 or 15 inches apart, on a south border. When the rough leaf appears they should be somewhat severely thinned, say from 6 to 9 inches apart in the rows, to afford each plant ample space for its full development. Not only will superior quality be thus insured, but a heavier bulk may be obtained from a given area, should the plants be allowed to grow thickly together. Close attention is necessary as to weeding and watering, as occasion may require. By the end of August they will have become large and vigorous, when a position should be chosen in some sheltered part of the garden on which to erect a structure to receive them, viz., a three-light frame or more, according to the requirements of the establishment. The most important point is to provide efficient drainage, for there is no doubt that more Parsley is annually lost through insufficient drainage than from actual frost. A quantity of brick-rubble should be laid at the bottom to the depth of 9 inches, so that the bed may be raised above the general level of the ground. The frame should then be placed on this; next a slight covering of rough leaves or stable-manure, and lastly a good layer of prepared soil, which must neither be too light or too rich. A suitable compost will consist of three parts loam, one of leaf-soil, one of decomposed cow-manure, and one part mortar-rubble; the whole should be well mixed before being placed in the frame. Press the soil firmly as it is thrown in, making it up to within 6 or 8 inches of the glass, and rake the surface level.

Before removing the plants give them a thorough soaking with water. It is a good plan to remove a portion of the leaves from the plants about a fortnight before they are lifted from the seed-bed, as by so doing the plants will receive less check than would otherwise be the case. The roots may be planted at about 6 inches apart each way, after which they should be watered and kept moderately close for a few days, shading from bright sunshine. When established, give abundance of air, and finally remove the lights entirely, except during rainy weather, when

they should be blocked up at the back and front to admit plenty of air. At no time after the plants have become established should the lights be closed, except there be hard frost and snow, when they will need to be covered with mats. Parsley may be grown well and with certainty by this method, for in such a structure the roots and stems can be kept in that dry state which is so indispensable to their health in the winter season. H. T. M., Stoneleigh.

SOCIETIES.

BRIGHTON AND SUSSEX HORTICULTURAL.

AUGUST 24, 25.—This was one of the best of several good summer shows held by the above Society. The Dome, Corn Exchange, and Lawn proved none too ample for the many (660) exhibits and classes (107). A prominent feature was the number and excellence of non-competitive exhibits. Messrs. BALCHIN & SONS, Hove; Messrs. VEITCH & SONS, Chelsea; Messrs. FREED & SON, West Norwood; and Messrs. LING & SONS, Forest Hill, were each awarded the Society's Silver Medal for their collections. There were many other exhibits, but these were of notable excellence.

As most of the classes were well filled, and many of them drew forth unusually strong competition, we can only give the chief winners in the most important classes.

GROUPS.—In the open class for miscellaneous plants, Mr. W. C. HOLLANDS, Tunbridge Wells, won from Mr. G. MILES, Dyke Road, Nursery, Brighton, both groups being well set up, but the first-named was an extremely light and pretty arrangement. The Corporation Challenge Cup and a Silver Medal went with the 1st prize.

Brighton makes a feature of its groups, and that of Ferns, from Mr. G. MILES, Dyke Road, was well set up, just beating Mr. ADAMS, gr. to the Rev. Sir GEORGE SHIFFNER, Bart., Hamsay, Lewes.

Mr. TURNER, gr. to Sir GREVILLE SMYTHE, Wick Hall, Hove, won for a group of miscellaneous plants in the division for amateurs and gentlemen's gardeners only.

TABLES OF FLOWERING AND FOLIAGE PLANTS were good, Mr. LAWRENCE, gr. to T. OLIVER, Esq., Tunbridge, Horsham, winning from Mr. W. C. HOLLANDS, closely followed by Mr. G. MILES. In the amateurs' division a table of plants arranged against a wall was a pretty and useful feature; this was secured by Mr. T. WELLS, 24, St. Martin's Street, Brighton.

PLANTS were very good and clean, the colour and finish those from J. WARREN, Esq., Handcross Park, Crawley, and Mr. A. GIBSON, gr. to T. F. BURKARD ATKINS, Esq., Halstead Place, Sevenoaks, being worthy of special note.

Mr. GIBSON beat Mr. WARREN for six stove and greenhouse plants in bloom; but Mr. WARREN was ahead for six Exotic Ferns, a specimen Croton (very bright), a specimen Palm, and a stove or greenhouse plant in bloom.

Mr. T. FAIRS, gr. to R. CLOWES, Esq., Clayton, Hassocks, won from Mr. E. MEACHEM, gr. to Miss ARMSTRONG, Woodale, Preston, for twelve Begonias; Mr. E. BOYLING, gr. to Miss WILLET, Mursplepoint, beating Mr. FAIRS for six Glaxias.

Mr. LAWRENCE beat Mr. GARNETT for six Crotons; but the positions were reversed for six very highly coloured Dracenas.

Mr. LAWRENCE, Messrs. W. MILES & Co., Hove, and Mr. J. WARREN, won in this order for some well-grown table-plants; while for a small collection of Orchids in bloom, Mr. J. HARPER, gr. to E. A. TUCKER, Esq., Vernon Lodge, Preston, beat Mr. H. GARNETT, gr. to R. G. FLETCHER, Esq., Mount Harry, Preston.

CUT FLOWERS.—Twenty-four varieties of stove and greenhouse flowers found Mr. W. ARCHER, gr. to Miss GIBSON, Saffron Walden, Essex, well in front, and the Society's Silver Medal was justly awarded. Mr. W. TAYLOR, Hampton, Middlesex, and Mr. T. DERRANT YOUNG, Eastbourne, were the only competitors for twenty-four cut Roses, and were awarded 1st and 2nd prizes respectively.

Mr. HARRIS, Denne Park, Horsham, won from Mr. T. D. YOUNG for twelve Teas or Noisette Roses.

Dahlias were exceptionally good and numerous. Mr. T. MORTIMER won for forty-eight varieties of show and fancy blooms; Mr. F. W. SEALE, Sevenoaks, following. Mr. F. W. SEALE was ahead of Messrs. KEYNES & Co., Salisbury, for twenty-four singles, and also for twelve Pompons; but Messrs. KEYNES & Co. were well in front for twelve bunches of Cactus varieties. All of these were well staged, and they made a most effective show.

FRUIT was well coloured, and of good quality. For three bunches of Black Hamburg Grapes, Mr. T. DANCY, gr. to E. J. POPE, Esq., Horsham, won with well finished examples; Mr. D. GIBSON won for three bunches of black, and three of white Grapes; and Mr. HARRIS, Horsham, for one bunch in the amateurs' division. Mr. LAWRENCE was 1st for two Melons. Mr. F. POTTER, gr. to R. WORSLEY, Esq., Cuckfield, won for two dishes of Peaches. Nectarines, Pears and Apples were also good. Mr. J. GORE, Polegate, was well ahead of Mr. Goldsmith, gr. to Sir E. LODGE, Bt., Leonardslee, Horsham, in a strong class for a collection of fruit.

VEGETABLES.—It was remarked how good these were notwithstanding the weather had been exceptionally dry in this district. The Bronze Medal and 1st prize was awarded to Mr. W. Manton, gr. to Mrs. CLIFFORD BOWER, Picknell, Bolney, for a collection of nine distinct dishes in the open division; while the special class, open to gardeners only, found Mr. H. Knight, gr. to Mrs. BARNISTER, Cuckfield, well ahead. Both were strongly contested classes; as also was that for six dishes of Potatoes, in which Mr. F. Draycott, gr. to Lieut.-Col. DUDLEY SAMPTON, Lindfield, won.

Among other exhibits not for competition we especially noticed a collection of Dahlias, &c., from Messrs. J. CHEAL & SONS, Crawley; and some good Tea and Noisette Roses from Mr. O. M. PIPER, Uckfield, Sussex.

KINGSWOOD HORTICULTURAL.

AUGUST 25.—This Society, which was formed only six years ago, has greatly prospered. Kingswood is a great industrial district, lying on an elevation east of Bristol, (sited in many ways for the culture of plants, and among the working-classes there are a great number of keen florists, who have small houses in which they grow plants to great perfection, and in the open they produce excellent cut flowers. The inhabitants take a great interest in their annual show; they decorate streets and houses, and now there is a line of electric cars running from Bristol to Kingswood, thousands of persons come out from the city to see the exhibition. The tents were in a field adjoining the Viaduct.

Certain classes open to all attract fine exhibits; thus, Mr. J. CYPRUS, of Cheltenham, showed sixteen stove and greenhouse plants, and he won with ease the handsome 1st prize. Mr. Cypher also won the handsome Silver Cup offered for a group of not less than 100 feet; it was a superb arrangement. Mr. Wilkins, gr. to Lady THEODORA GUEST, Inwood House, Blandford, was 2nd. There were very fine double and single-flowered Begonias; superb specimen Fuchsias from the Trowbridge district, and others. In the amateurs' division, open to all, Mr. GEO. TUCKER, Hilberton, Trowbridge, took the 1st prize for six fine specimen stove and greenhouse plants; Mr. WILKINS being again 2nd. In the cottagers' division there were also well-grown plants, in many respects beyond the quality usually seen.

There is always a good show of cut flowers at Kingswood. The best twenty-four varieties of Roses in trebles came from Mr. S. TANNER, Cardiff; and the best twelve from Mr. THOMAS HOBBS, Lower Easton, Bristol. Dahlias were well shown; Mr. T. HOBBS taking the 1st prize with twenty-four blooms; Mr. G. HUMPHRIES, Chippenham, had the best twelve varieties; single and Cactus varieties were also shown. The pretty Pompons do not as yet find a place in the schedule. No very good quilled Asters were staged; the Comet type represented the flat petalled varieties. In all other classes for cut blooms, and they were many, good quality prevailed.

Fruit was fairly good; and Vegetables numerous and very fine.

BATTLE FLOWER SHOW.

AUGUST 25.—This event, in which not only the exhibitors but the whole neighbourhood take a warm personal interest, was held on the above date. A heavy thunderstorm, attended by hail and rain, marred its success financially, but the show was well up to the average. This society allows the two ill-defined classes, amateurs and cottagers, to enter the lists together in Division II., to the occasional discomfiture of the well-named; but doubtless the encouragement given to cottage gardeners by the Duchess of Cleveland, Lord Brassey, and his family, who offer substantial prizes, is the main cause of this.

The exhibitors of both flowering and foliage plants were much the same as shared the honours at Hastings; but the fruit staged was larger in quantity, and better in quality. Mr. W. ALLEN, gr. to Lord BRASSEY, secured the lion's share of the prizes. In some classes he was very closely run by Mr. J. GORE, fruit-grower, Polegate, whose Gros Maroc Grapes were faultless, while Mr. ALLEN's Muscat of Alexandria were perfection itself.

American Peaches were to the fore, Sea Eagle taking both 1st and 2nd prizes in Division I. Grapes were very good; three bunches of Madresfield Court, shown by Mr. J. GORE, were models of culture and finish.

Plums are always a great feature here. Mr. B. H. THORPE, Battle, again took 1st honours with Transparent Gage, their luscious pulp showing golden yellow through their delicate skin. The 1st prize for culinary Plums was awarded to a fine dish of the old Plum, Belle de Louvain, and 2nd to Victoria, which variety originated in Sussex.

Morello Cherries were fine and clean, Mr. ALLEN securing 1st prize for a plate of fifty fruits.

Pears.—1st, Clapp's Favorite, Mr. J. GORE; 2nd, to Souvenir du Congrès, not so named.

Culinary Apples.—1st, W. ALLEN, with a handsome dish of Peasegood's Nonsuch; 2nd, Warner's King, by A. Hewitt, gr. to Captain ELLICE.

Desert Apples.—1st, W. ALLEN, with Irish Peach; 2nd, Mr. THOMAS WANNOCK, with Lady Sudeley.

For a collection of eight dishes, 1st, Mr. J. GORE, Polegate; 2nd, to the Abbey Gardens (Mr. CAMM).

Nothing calling for notice was shown in Division II., but

the cottagers' class produced some excellent dishes of culinary Apples, Mr. T. BRYANT, Newport, securing an easy 1st with Glory of Hants; while Mr. R. SAUNDERS, Netherfield, was a close 2nd, with Potts' Seedling.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

AUGUST 26.—On the occasion of this meeting, Wm. THOMPSON, Esq., Walton Grange, took the Chair.

The number of exhibits was few, but many of them were distinguished for high quality, and thirty-four plants were submitted to the committee.

WM. THOMPSON (Mr. Stevens, gr.), showed Cattleya Gaskelliana Nolle (Award of Merit), a freely-formed flower of the lighter strain, also Cattleya speciosissima (Award of Merit); this was a flower good in every point, with two white spots on the lip, which formed a good contrast with the shaded bluish tints of the rest of the flower; the pretty Oncidium venustum (Rolfe), with flowers the colour of O. concolor, but not as large. It received a Cultural Certificate, but an "Award of Merit" would have been a more fitting award.

A. WARBURTON, Esq., Vase House, Haalingden (Mr. Thos. Lofthouse, gr.), showed Cypripedium Lawrenceanum Hyanum. This deservedly received a First-class Certificate.

THOMAS STATTER, Esq., Stand Hall (Mr. R. Johnson, gr.), sent a number of valuable plants, the more prominent being Cypripedium Lord Derby (First-class Certificate). This is a very large flower, somewhat similar to C. x Morganii Burfordense. It is a cross between Rothschildianum and superbiens, and is an improvement on either of them. The chief gain in the progeny lies in the broad-leaved sepals and petals, and in the Indian-red spotting of the lip, which is of a higher colour than in the pollen parent; it was a well-grown plant. Along with this was a plant of Laelia-Cattleya Nysa superba (Award of Merit). This is a brilliant flower, and might have deserved a higher award as a seedling of Laelia-Cattleya crispata x with Cattleya gigas. The Laelia purpurata Blenheimense from the same exhibitor (Award of Merit) is an effective flower; and Cattleya gigas delicata (Award of Merit) is one of the prettiest of that showy section.

SAMUEL GRATRIX, Esq., Whalley Range (Mr. R. McLeod, gr.) showed Cattleya x Mary Gratrix = C. Harrisoni, or rather C. intermedia and C. Schofieldiana; the peach-coloured ground of C. Harrisoni and the spotting of C. Schofieldiana were very obvious, the whole flower forming an interesting object-lesson for hybridists. The same exhibitor had Cypripedium x Chapmani, Gratrix's variety (Award of Merit); and Cypripedium x Callo-Rothschildianum = Rothschildianum x album, both of which are fine gains in their way.

Mr. J. ANDERSON, Wallace Avenue, exhibited Cattleya Harrisoni guttata, in which the whole of the sepals and petals were regularly covered with cherry-red spots on a peach-coloured ground, through and through the fabric; he also showed a pretty coloured form of the pale flowered section of Cattleya Schofieldiana—a very striking form; and several showy Cattleyas of the finest quality, including C. superba.

E. J. SIDEBOTHAM, Esq., Eriadene, Bowdon (Mr. Shiner, gr.), had a remarkable example of Cattleya Leopoldi, the flowers of which remind one of Oak-leaves in October; the plant is not vigorous, but the flowers are of fine size, and found favour with the committee, who awarded it a First-class Certificate.

T. LEMANN, Esq., West Bank House, Heaton Mersey (Mr. Edge, gr.), showed some very choice plants, the most striking of which was Lycas e leucantha (whose?), which the committee asked to see again; also Dendrobium Victoris regina, Cattleya aurea, and several others.

H. GREENWOOD, Esq., Highfield House, Haalingden (Mr. Spurr, gr.), showed Zygopetalum Gautieri (Award of Merit), growing on a Tree Fern stem, the flowers looking all the better for being in the midst of the fronds; he also showed a good variety of Miltonia Morelliana atrorubens (Award of Merit). W. H. ALMOND, Esq., Alumacarr, Blackburn, exhibited a fine form of Cattleya Gaskelliana, with more than a dozen flowers in fine condition, and several blooms of Cattleya Leopoldi.

SWANSEA HORTICULTURAL.

AUGUST 26.—The first annual show of this Society took place on the above date, and was a great success. It was held in the New Market, which has been built at a cost of nearly £27,000. The value of the market as a place for holding the show was proved on the first occasion, for during the day rain fell in torrents, but there being accommodation sufficient for thousands, visitors were rendered independent of the weather. The exhibits were excellent in quality and quantity, about 900 entries being sent in. The Trade exhibits formed a prominent feature of the show.

Messrs. KELWAY & SONS, Langport, Somerset, staged a grand exhibit, consisting of 100 spikes of Gladioli, and collections of Dahlias, Delphiniums, and other herbaceous flowers. Messrs. THESDORP of Cardiff put up a magnificent collection of Dahlias. Messrs. CLEBURN & SON of Altrincham a fine collection of herbaceous flowers.

Messrs. DICKSON's exhibit of Roses in bunches was greatly admired, including as it did many of the most beautiful kinds.

Messrs. PARSONS & Co. and Mr. A. KITLEY, both of Swansea, had exhibits also of horticultural produce.

The best and most attractive exhibits were the several

groups of miscellaneous plants arranged to produce the best effect. The 1st prize of £5 was offered by Sir J. T. D. Llewelyn. Each group occupied 100 square feet, and it would be difficult to imagine a better aesthetic effect. The group from Mrs. PICTON TURNERVILLE's gardens at Hendre-fellan took the 1st prize. Taste in arrangement, no less than the rare beauty of the plants, told in its favour, and Mr. Hawkins, the gardener, is to be congratulated upon his success. The centre-piece was a stately Palm, and between this and the dainty border of Panicum variegatum were handsome Colosias, Eulalias, prettily-tinted Coleus, and delicate-looking Asparagus Ferns, mingled promiscuously but artistically with the choicest of flowering plants. The group exhibited by Mr. W. FARRANT, which took 2nd prize, was very little behind. In the centre a Palm (Seaforthia elegans) rose majestically, and the Crotons, Dracenas, Coleus, and Palms of several varieties that surrounded it, were exceptionally beautiful.

In the groups occupying 50 square feet, for amateurs and gentlemen's gardeners residing within twenty miles of Swansea, there were four competitors, and standing, as they did, near the more magnificent plants, they were thrown slightly into the shade. Still, the groups were excellent, the predominating plants being the same as in the larger groups.

There was a number of classes for plants, both stove and greenhouse species, and the exhibits in these were satisfactory.

One of the most interesting departments of the show was that for cut flowers, the blooms shown in competition being of the very finest quality. For Roses, Mr. RALPH CROSSLING of Penarth, and Mr. THOMAS PENRICE came into close competition, the former carrying off the prize. In the class limited to a radius of 20 miles, Mr. T. PENRICE, whose Roses are the envy of Gowerland, was easily 1st.

Double Dahlias were splendid, and here Mr. GEORGE HUMPHRIES, of Chippenham, was the most successful exhibitor. For symmetry in petal formation, and for purity in colouring, from the chaste white of the Flag of Truce variety to the quaint hues of the Dorothy, and the deep beauty of the Victor, his stand of Dahlias would be difficult to excel. In Cactus Dahlias Mr. HUMPHRIES again took 1st prize.

Asters were not exceptionally good, and there was little to choose between the stands of Mr. HUMPHRIES and Mr. G. POULET, of Morriston, who was amongst the most successful exhibitors in the show.

The prizes offered for bouquets were productive of some charming specimens of the florist's art.

GRAPES were very good, those from the vine of Mr. PHILIP RICHARD, which took 1st prize, being exceedingly fine. Mrs. PICTON TURNERVILLE's vine yielded fruit scarcely inferior.

VEGETABLES were shown in some quantity, and the quality throughout was commendable.

SANDY AND DISTRICT HORTICULTURAL.

AUGUST 24.—This exhibition was originated twenty-nine years ago, and has been continued ever since. One great attraction is found in the fact that almost everything that can interest country people is represented—plants and flowers, fruits and vegetables, market-garden and farm produce, dogs, cats, poultry, needlework, carving, &c. All these are arranged in a series of tents formed in an irregular circle running round the park of Sandy Place, in which the show is held. Anyone interested in country pursuits would find a visit to the Sandy show one that would both instruct and entertain.

From a horticultural point of view, the Sandy show is an important one. Good prizes are offered for certain plants and cut flowers, open to all comers. There is one for ten stove and greenhouse plants in flower, and Mr. J. CYPRUS came from Cheltenham with some very fine specimens. There were some nice groups arranged for effect from local exhibitors; very good zonal Pelargoniums, and local classes for foliage and stove and greenhouse plants, Fuchsias, Begonias, Coleus, &c.

Sandy has pre-eminently a cut-flower competition, the largest tent being filled with them. There was a class for forty-eight cut blooms of Roses, and some very nice fresh blooms were staged by Mr. J. MATTOCK, nurseryman, Oxford; and Messrs. G. & W. BURCH, nurserymen, Peterborough, were 2nd.

Mr. MATTOCK had the best eighteen Tea-scented Roses, showing some excellent blooms.

In the amateurs' divisions some fairly good Roses were staged. Dahlias were a good feature, the prizes bringing some of the leading growers. Mr. S. MONTIMER, Swiss Nursery, Farnham, was 1st, with a superb lot of blooms. With twelve fancy Dahlias, Messrs. KEYNES & Co., were 1st, some very good blooms being staged. Pompon, Cactus, and single Dahlias were also very good features; and of the Cactus type, Messrs. KEYNES & Co. put up a superb stand of twelve bunches, some of them new varieties of great beauty.

Hardy flowers were magnificent; there were five or six collections of twenty-four bunches, many of them large and imposing. The best came from Mr. W. H. LEES, gr. to F. A. BEVAN, Esq., Trent Park, Barnet, who had a remarkably fine selection admirably staged. In the amateurs and cottagers divisions, good cut flowers generally were staged.

FRUIT AND VEGETABLES were extensively shown the latter particularly so. The special prizes offered by Messrs. SUTTON & SONS and Messrs. CARTER & CO. brought very fine collections.

ACCRINGTON AND DISTRICT HORTICULTURAL.

AUGUST 27.—This exhibition was a creditable one, comprising plants arranged for effect, and also a large quantity of florists' flowers, as well as a fine exhibition of Grapes and other fruits, and many vegetables.

Mr. BRIGGS-BURY, Bank House (Mr. John Wilkinson, gr.), sent for exhibition only a fine group of *Ore'ids*, prominent among which were *Cattleya Gaskelliana* magnifica, a flower of very large size, with a beautifully blended orange and cerise lip, and the peach-coloured segments standing flat and close together. One or two well-grown *Laelio-Cattleyas* shone out, and among *Cypripediums* there was nothing finer than *C. Crossianum*. A. WARBURTON, Esq. (Mr. Tom Loft-house, gr.), had *Cypripedium Lawrenceanum* Hyeaenum, and the much-spoken-of *C. Insigne* Laura Kimball. This was in much better condition than when shown in Manchester by H. Low & Co., being quite free from spots, but not so finely finished a flower as I was led to believe. J. A.

HAMBURG GENERAL HORTICULTURAL EXHIBITION.

Special Show.

AUGUST 27—SEPTEMBER 5.—Having just returned from a visit to the great horticultural exhibition at Hamburg, I think it possible that a short description of the show may be of interest to your readers. As has been previously mentioned in these columns, the exhibition has been open since last May, and will continue open until the end of September, several special shows meanwhile being held of the fruits flowers, &c., in season. The permanent exhibits are Conifers, evergreens and deciduous trees, fruit trees, Roses, hardy herbaceous perennials, Dahlias, Cannas, bedding-plants, &c.

The exhibition is held in a public park between the Holstein and Millern gates, the site being a part of the old moat and ramparts of the free city of Hamburg. The moat being filled with water, fringed with Rushes and aquatics, spanned by rustic bridges, and having one or two charming chalets on its banks, is a great feature in the landscape and the old rampart being clothed with trees in places, and fine lawns sweeping down to the water, breaks up the ground, and makes it an exceptionally favourable spot for laying out a garden on a large scale. The grounds consist of some 45 acres, and the exhibits, which are under cover, are mainly housed in structures of wood and canvas, erected around the margins of the park, leaving the centre free; the exception to this is the grand hall, which is a huge structure on the summit of the bank overlooking the moat, and visible from every part of the garden. I have no measurements to guide me, but, roughly speaking, I should say the interior, which is used for displaying plants, is some 300 feet long by 150 feet wide. There is a large gallery at the east end, also a lecture-hall and committee-rooms. The building, which is of wood cost 300,000 marks.

INTERIOR OF GREAT HALL.

I need not trouble you with a description of the exterior of the building or its architecture, but will endeavour to describe the interior as seen from the large gallery at the east end. In the centre is a huge dome lighted by four dormer windows, and a central light at the top; right and left are short transepts with large windows, and facing one there is what may be described as a long chancel, dim and dark. I have used terms of church architecture to describe the building, and really in form it most resembles a church, and certainly the light is "dim" if not "religious." The whole interior, dome, arches, and massive-looking pillars, are white, relieved with gilt here and there. Under the dome is a basin of water with rock edges, surrounded with beds laid out in a regular pattern, and these are massed with plants in pots, Cyclamen, Begonias, Roses, Carnations, Lily of the Valley, and small foliage plants, each bed of one kind, and surrounded by masses of Maidenhair Ferns to afford relief. This garden is flanked on either side by a group of Palms, with feathery specimens 20 feet high, breaking the groups here and there. Looking away to what I have called the chancel end is seen a large mass of *Caladiums*, behind which are *Dracenas*, and a deep background of Palms reaching up to a great height; immediately under the spectator is a fine bank of *Crotons*, *Dracenas*, and other foliage plants; the sides have also groups of mixed flowering and foliage plants, and beyond these are galleries filled in similar style. The water for the centre basin enters on the right hand side by a cascade with quaint figures of sea gods, and escapes by a sort of rock grotto. At the south-west corner of the building is a tunnel of rockwork, clothed at the entrance with Ferns and Palms, and leads out into the gardens.

As a whole, the view in this large building is very pleasing; there is a wealth of immense Palms which one rarely sees, and they form an admirable background, preventing any appearance of flatness or dwarfing which ordinary plants would have in such a large and apparently massive building. With regard to the plants themselves, I suppose such a number of fine Palms has seldom been seen together, the bulk of

them are sent by Mr. L. WINTER, of Bordighera, and are grown out of doors at his home in Italy, although Mr. A. Wager, of Leipzig, shows some fine specimens of indoor culture; one is struck by the well-grown and finely-coloured *Dracenas*, *Crotons*, and other foliage plants, but the flowering plants are not equal to those seen at home.

PROFUSION OF CUT FLOWERS.

Passing from the central hall, one finds a building some five hundred feet in length devoted to cut-flowers arranged as bouquets, sprays, wreaths, crosses, and in all kinds of fancy designs; there are also vases of flowers and wreaths of foliage with wild fruits and berries. To attempt a description would be vain, a jury of five judges has been three days making awards, so that space would fail were one to attempt to review this department, even in a superficial way; suffice it to say, that any lover of flowers could well spend a day there, and it would repay a long journey to do so. In the matter of bouquets and sprays we have not much to learn, and a visitor who had seen this department at Shrewsbury this year would have no need to blush for our English bouquet artists; yet one could not help admiring the dainty little bridal bouquets which are used in Germany, just a light little arrangement of Myrtle, white Roses, and a few Lilies of the Valley with a narrow white ribbon and lace, a bouquet which we should call a child's bouquet, and yet perhaps more suitable for a bride to carry than our larger arrangements. Whilst one's insular taste is perhaps not quite educated (I do.) enough to admire windmills, wheelbarrows, and other monstrosities formed with flowers, and which are apt to recall to one's mind the fearful designs made of butterflies which one used to see in years gone by in the windows of local naturalists, yet one could but admire some of the fancy designs, and more particularly the admirable taste shown in the arrangement of colours. One or two designs which struck me as tasteful I will briefly mention, passing by the hundreds of wreaths, broken lyres, and other well-known emblems. Firstly, a broken wheel resting against a pillar, the wheel and pillar of Silver Birch, the wheel ornamented with *Odontoglossums* and Maidenhair, the pillar entwined with *Niphetos* Roses and sprays of brown *Berberis*. Again, a basket of white Water-Lilies and Bulrushes was most charming; as was a tall vase of frosted silver filled with *Gladiolus Frencheyensis*, *Vallota purpurea*, *Lobelia cardinalis*, with its dark foliage, and scarlet *Cactus Dahlias*. Cushions seemed much in vogue, a design that one cannot approve of, for who wants to sit upon flowers; yet some were very pretty; a dark cushion of *Scabious* fringed with grasses, and a spray of *Lapageria alba* upon it; another of purple Stocks with white Roses; and again one of *Mignonette* with *Cypripediums*, [were very pleasing. One could not help noting an inverted umbrella composed of *Hydrangea paniculata* edged with Maidenhair—at a little distance the peculiar white and greenish tones of the *Hydrangea* exactly resembled lace, and the design was relieved by a few *La France* Roses. A white marble cross made of *Chrysanthemum* blooms packed together with a trailer or two of *Clematis discolor*, and pale Roses twining round, with a base of white specimen Lilies and Palm leaves was very striking. But we must leave this department, and passing rapidly through other buildings containing *Dracenas*, Palms, &c., we arrive at a structure where Erfurt is the title. Here are represented the articles for which the Erfurt seed growers are famous, and one finds large collections (and alas, designs in colour) of Asters, Zinnias, Phlox, *Gallardias*, *Potunias*, Marigolds, &c. The quality of the exhibits, especially Asters, is not equal to one's expectations—but the season has not been favourable for the development of good blooms. Cut blooms of herbaceous plants and *Gladioli* form an important feature, and Messrs. HAAGE & SCHMIDT have a fine group of a really white *Gladiolus*, White Lady.

MISCELLANEOUS EXHIBITS.

Mr. WINTER fills the next section with Palms, and then in a quiet corner we find Mr. SANDER, of St. Albans, with a magnificent group of *Nepenthes* and new Palms. Messrs. H. Low & Co. have a group of Orchids, and several amateurs are represented with good plants.

In the next building are fruits and Tomatoes, Vines in pots, fairly done; Apples and Pears in pots, good, shown by an amateur; the most striking exhibit is a case of Black Hamburg, lauded in a pot and encased in a glass structure, the case carrying twenty large bunches of finely-coloured and well-finished fruit. The Apples, Pears, and Plums in this department are poor, and for the most part unnamed.

Out of this building one passes through a permanent exhibit of much interest, which consists of a collection of insects injurious to horticulture and forestry, with specimens of damaged foliage, wood, &c., and the insects in all stages. Then comes a building of market plants, and from this one passes to a structure sacred to the dwellers at Wandbeck. The horticulturists of Wandbeck have furnished this building since the commencement of the exhibition. At the present moment the central portion is filled with flowering plants, double and semi-double and *Pelargoniums*, *Gloxinias* (good), Carnations, and Lily of the Valley, also *Dracenas* and small Orange trees; the sides with Palms and foliage plants. One grower has a collection of bulbs in a dry state—*Tulips* and *Hyacinths*—but I hear that most of his produce goes to Holland. Centres of trade are difficult to establish, and not easy to remove; and it will be long ere Holland ceases to be the recognised home of *Hyacinth* and *Tulip* culture.

Wandbeck is one of the centres of Lily of the Valley culture, and some interesting photographs of the fields are exhibited; in one of these may be seen sixty women and boys

picking up the crowns as they are turned out by the plough; in another eighteen women working "plant juns" hoes, this almost rivals "Chinese cheap labour."

Crossing near to the principal entrance, one finds streets of vegetables on tables in the open air. To our mind this was the most disappointing feature of the exhibition; most of the prizes were awarded to collections rich in number of varieties but poor in point of quality, while other collections smaller in point of numbers, but of fresh, good stuff had to be contented with lower awards. Some of the market growers put up admirable collections not for competition, but a great many of the vegetables contained in the large exhibits were stale, badly grown, and rough. The Potatoes (excepting those of the market-growers) were beneath contempt from an exhibitor's point of view, small, scabby, ill-formed, split with the digging-fork, and devoured by wire-worm, a cottage-garden show at home would have refused them bench room.

Collections of Cucumbers in a ripe state did not appeal to us, but here they preserve them, and afterwards eat them! The small Carrots, Radishes and Salads of the market-growers were good, and naturally Cabbages were to the fore both in numbers and quality, but it struck us as rather overdoing the thing when one seedsmen showed sixteen distinct varieties of Red Cabbage, and we doubted the ability of anyone to rename them had their labels been taken away.

Next to the vegetables is a structure some three hundred feet long of cut-blossoms, principally Dahlias, of which flower one exhibitor staged five hundred different varieties! We did not take notes of all of these. Messrs. LEMOINE & SONS showed a fine lot of new hybrid *Gladioli*, and other exhibitors had collections of Herbaceous Perennials, Zinnias, Asters, *Montbretias*, &c.

It will give your readers some idea of the vast number of exhibits in the various classes if we state here that the judges for this particular show numbered 120, and that it took upon the average a day and a half for them to complete their labours.

THE VIEW OUTSIDE.

Leaving the buildings, we may say with regard to the gardens that their natural features, already mentioned, have been made the most of by the honorary landscape architect Mr. Rudolf Jürgens, and the result is highly creditable. Bold sweeping roads, I had almost said walks, permit of thousands of visitors promenading without inconvenience, and as there are 70,000 season-ticket holders, this is important. The permanent exhibits of Conifers, herbaceous plants, &c., are all treated with an eye to general effect, and the result is really more like an ornamental garden than an exhibition.

It would be quite impossible in the limits of this sketch to mention a tithe of the outdoor exhibits, but one cannot fail to notice a large oval basin of water on the terrace, in which is growing a collection of aquatics planted by the Curator of the Hamburg Botanical Garden. They were planted early in May, but have the appearance of having been established for years, so luxuriant is their growth. Of course the temperature of the water is artificially raised. In the centre of the basin is some rockwork, with various Rushes growing around it, and on the margin of the water are Arrow-heads (*Sagittaria*), &c. The surface is now almost covered with Lilies of many descriptions in full bloom; especially fine are *Nymphas*, *Ortgiesiana*, which has a lovely pink bloom, with pointed petals, and dark foliage, of striking contrast, the flowers being produced very freely. *Camboma caroliniana*, with single yellow blooms, like a *Malva moschata*, most charming; *Eichhornia azurea*, a blue water-Hyacinth, and many others.

Standard-trained plants seem much in demand, and are in many instances used with good effect. Especially fine is a bed of standard *Heliotropes*, with stems like young Apple trees; the standard *Fuchsias* are also good; and a bed of standard *Pelargoniums*, with a dark background of Pines, is striking. Roses are a great feature in the permanent exhibits; and, in addition to many large beds of standards planted about the gardens, there is a Rose-garden proper of some acre in extent, and also extensive beds of dwarf Roses in another part of the grounds. Many of the standard Roses are worked upon *Rosa laxa*, and have stems of the thickness of a lead-pencil. These necessitate supports, but they enable the grower in Central Germany to lay his plants down in the winter, and cover them with soil and straw, thus escaping destruction by frost. Not many Roses are in bloom, as it is now between the seasons, but we noticed that the standards upon *R. laxa* had more flowers than those on the *Rubra*. Whether this is the case all through the season, we could not ascertain.

Cannas planted singly on the grass are in great numbers and very effective, masses of *Lilium speciosum* in sheltered spots are superb; and *Gladioli* are in full beauty, but buried in places by blanks suggestive of disease. Cat-bedding is represented, but does not call for any remarks. Alpines and hardy Ferns are planted on the shady side of mounds, and there are borders on the outside of the gardens proper devoted to annuals. Here also one finds the model fruit gardens, enclosed by trained trees stretched on wires, palmettes, cordons and horizontally trained, and inside squares of pyramid trees with edgings of horizontal cordons; the trees are most of them excellently trained, but very old and what we should term scrubby; of fruit they do not carry much this season. Standard Gooseberries and Currants are especially well done, and have carried large crops of fruit; trained Cherries and Peaches are poor, especially the latter.

HOW THE JUDGES FARED.

I must conclude these notes with a word of thanks to our entertainers. We were received with every kindness and

courtesy, a special tour round the city in coaches, and through the docks and harbour in steam launches, being arranged for our last day, which concluded with a dinner in the Great Hall at night. The judges were of diverse nationalities, including a Turk, a Dane, some Swedes, a sprinkling of French and Belgians, a couple of Englishmen, and the same number of our countrymen from the United States. Speeches were delivered in all sorts of languages, old friendships renewed, and a general "good time" enjoyed. It will be long ere the memory of the Hamburg International Exhibition of 1897 fades from the memory of A. H. Pearson.

Obituary.

W. H. BLAND.—It is with regret that we have to record the death of Mr. W. H. Bland, of the Old Nurseries, Fordham, Cambs, in his 80th year. He was the raiser of the Hollyhook Black Night, of a Tree-Box which is unsurpassed at the present time, and of a golden variegated Spruce. His son, Mr. Edwin Bland, will carry on the business.

The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.

TEMPERATURE.	RAINFALL.	BRIGHT SUN.
ACCUMULATED.	RAIN.	SUN.
Above 42° for the week ending August 28.	More (or less) than 42°.	No. of Rainy Days since Jan. 1, 1897.
Above 42° for the week.	Below 42° for the week.	Total Fall since Jan. 1, 1897.
Above 42° difference from Mean since Jan. 1, 1897.	Below 42° difference from Mean since Jan. 1, 1897.	Percentage of possible Duration for the Week.
Above 42° difference from Mean since Jan. 1, 1897.	Below 42° difference from Mean since Jan. 1, 1897.	Percentage of possible Duration since Jan. 1, 1897.

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Graining, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W. 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending August 28, is furnished from the Meteorological Office:—

"The weather during this period continued in a very unsettled state generally, but the falls of rain were less frequent and heavy in the extreme north and north-west than elsewhere. Sharp thunderstorms were experienced over England on the 24th and 25th.

"The temperature did not differ materially from the mean, but was slightly above it in the north, and below it in the south and south-west. The highest of the maxima were registered, as a rule, towards the end of the week, and ranged from 73° in the 'Midland Counties' and 'England, S.W.' to 69° in Ireland, and 68° in 'Scotland, N.' The lowest of the minima, which were recorded on rather irregular dates, ranged from 37° in 'Scotland, E.' and 38° in 'England, S.W.' to 43° in 'England, S.' and to 55° in the 'Channel Islands.'

"The rain/fall was less than the mean in Scotland, but more elsewhere, the excess in most parts of England and in the 'Channel Islands' being very considerable.

"The bright sunshine exceeded the mean in 'Scotland, N' and 'E.,' 'England, N.E.,' and over Ireland, and just equalled it in 'Scotland, W.;' in all other parts of the kingdom it was rather less. The percentage of the possible duration ranged from 51 in the 'Channel Islands,' to 43 in 'England, S.,' and to 31 in 'Ireland, N.'"

STATISTICS OF THE JERSEY POTATO CROP, FOR SEASON 1897, giving the number of packages and tons exported; also the average price per week at the States' Weighbridge (St. Helier), and a comparative table for fifteen consecutive years, 1897 included, viz.:—

MARKETS.

COVENT GARDEN, SEPTEMBER 2.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly by very Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

FRUIT.—AVERAGE WHOLESALE PRICES.

POTATOS.

Arrivals have been light the last few days, and prices a shade firmer. Present quotations range from 60s. to 95s. John Bath, 32 and 34, Wellington Street, Covent Garden, W.C.

SEEDS.

LONDON: Sept. 1.—Messrs John Shaw & Sons, Seed Merchants, of Great Malze Pond, Borough, S.E., report rather more business now passing in seeds. For Trifolium there is a moderate sale at the very low rates current; supplies appear falling off somewhat. Full prices are realised for Mustard and Rape seed. This season's winter Tares are good, cheap, and abundant. Rye is still scarce and dear. For Canary seed the tendency of values is distinctly upwards. The supply of Hemp seed is still short. New English Peas offer reasonably. Haricot and Butter Beans are advancing in price. Linseed is quiet.

FRUIT AND VEGETABLES.

GLASGOW: Sept. 1.—The following are the averages of the prices current here during the past week:—Pears, 3d. to 8d. per lb.; Apples, 4d. to 6d. do.; Plums, 4d. do.; Tomatoes, Guernsey, 3d. to 4d. do.; do., Scotch, 6d. to 7d. do.; Grapes, home, 1s. 6d. to 2s. do.; do., foreign, 6d. to 1s. do. Vegetables:—Golden Ball Turnips, 1s. 6d. to 2s. per doz. bunches; Cabbages, Scotch, 6d. to 8d. per dozen; Cauliflowers, Scotch, 1s. 3d. to 1s. 6d. per bunch; do., Dublin, 2s. 6d. do.; Parsnips, 5s. to 6s. per cwt.; herbs assorted, 1d. to 2d. per bunch; Mint, green, 6d. do.; Onions, Dutch, 3s. 6d. to 4s. per bag; do., Portugal, 1s. per stone; Parsley, 9d. to 1s. do.; Potatoes, best, 8d. to 10d. do.; Carrots, 10d. to 1s. per dozen bunches; Peas, 5s. to 10s. per cwt.; Cucumbers, 4s. to 4s. 6d. per dozen; Lettuces, round, 6d. to 8d. do.; do., Cos, 6d. to 8d. do.; Radishes, 4d. to 6d. per dozen bunches; do., London, 1s. 6d. do.; Horseradish, 2s. 3d. to 2s. 6d. per bundle; Beans, Broad, 1s. per stone; do., French, 3s. 6d. to 4s. per sieve; Mushrooms, 1s. per lb.; Beetroot, 4d. to 5d. per bunch; Mustard-and-Cress, 3d. per punnet; Spinich, 2s. to 2s. 6d. per stone; Rhubarb, 1s. 6d. to 2s. per cwt.

LIVERPOOL: Sept. 1.—Average of the prices at under-noted markets:—St. John's Potatoes, 1s. to 1s. 4d. per peck; Peas, 8d. to 1s. do.; Cucumbers, 3d. to 6d. each; Grapes, English, 1s. to 2s. 6d. per lb.; do. foreign, 4d. to 6d. do.; Pines, English, 5s. to 7s. each; do. foreign, 1s. do.; Mushrooms, 6d. to 1s. lb.; Birkenhead Potatoes, 10d. to 1s. peck; Peas, 1s. to 1s. 6d. do.; Cucumbers, 2d. to 6d. per lb.; Grapes, English, 1s. 6d. to 2s. 6d. per lb.; do., foreign, 6d. to 8d. do.; Pines, English

4s. 6d. to 7s. each. North Hay; Potatoes, Early Regent, 2s. 6d. to 4s. per cwt.; Kidneys, 4s. to 4s. 6d. do.; Turnips, 4d. to 6d. per dozen bunches; Swedes, 1s. 6d. to 1s. 9d. per cwt.; Carrots, 6d. to 8d. per dozen bunches; Onions, English, 7s. to 8s. per cwt.; do., foreign, 4s. 6d. to 5s. do.; Parsley, 4d. per dozen bunches; Lettuces, 4d. to 6d. per dozen; Cucumbers, 1s. 6d. to 2s. 6d. do.; Cauliflowers, 8d. to 1s. 6d. do.; Cabbages, 6d. to 1s. do.; Celery, 1s. 3d. to 2s. per dozen.

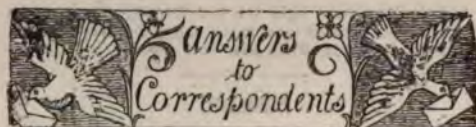

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending August 28, and for the corresponding period of 1895, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

BOOKS: *Perplexed Reader, My Gardener*, by H. W. Ward, and published by Eyre & Spottiswoode, East Harding Street, E.C.; *Villa Gardening*, by Ed. Hobday, and published by Macmillan & Co., Bedford Street, Covent Garden, W.C.

CORRECTION: In report of Eastbourne Show in our last issue, the second paragraph should commence Mr. Offer, gr. to J. Warren, Esq., Handcross Park.

COVERING OF A SLATE ROOF OF A COACH-HOUSE: X. Y. Z. Crimson Rambler Rose, as you suggest, would answer the purpose, and being of rampant growth, it would not be long in covering the roof. You might plant the climbing Rose Innocente Perpétue, a white-flowered Polyantha Rose of rapid growth and great floriferousness; or Wistaria sinensis, or Clematis flammula, a species with deliciously-scented flowers; or C. montana, early-flowering white, and many other varieties of Clematis. Sweetwater Vines, and Aristolochia Siphon might be thus employed.

CUCUMBERS: E. S. W. The specimen you have sent us affords no evidence of disease.

EARWIGS: W. S. E. Cut hollow stems of Bamboo into one-foot lengths, and fasten several of them to each Peach tree. The earwigs will hide in the stems, and if frequently examined, a large number may be destroyed.

FRUITING OF ARACARIA IMBRICATA: C. Sewery. It would be prudent on your part to greatly reduce the number of cones on the trees. In younger trees than yours the profuse bearing of cones would be a sign of deterioration and decay of vigour, but in trees fifty-five years planted this may not be the case; still, a reduction of the number is advisable.

FUNGUS IN SPENT HOPS: C. D. C. The Parasol Mushroom (*Lepiota procera*), very good eating. M. C. C.

FUNGUS ON CARNATIONS: W. J. C. Timely applications of the Bordeaux Mixture would doubtless ward off attacks of fungus, but nothing we at present know of will destroy it when once it has entered the tissue of the leaves. You do not tell us what species of fungus has attacked the "other plants." For mildew, flowers-of-sulphur, distributed with a muslin-dredger, usually suffices. The formula for the Bordeaux Mixture was given in our issue for July 3 last, p. 12. A very convenient remedy, when only a small quantity is wanted, consists of potassium-sulphide, 1 oz.; water, 3 gallons.

FUNGUS ON CARNATION: C. Abbot. Early stage of fungus, possibly *Heterosporium*, but too immature for determination. Why not try spraying with one of the copper solutions? M. C. C.

FUNGUS ON CHRYSANTHEMUMS: A. J. R. *Uredo Hieracii*, on Chrysanthemums. I am not aware of its having been found previously in this country upon Chrysanthemums, but it is common on other composite plants. M. C. C.

FUNGUS ON PHLOX: A. Hill. The material sent for examination is too scrappy to enable us to arrive at any conclusion. G. M.

FUNGUS: A. D. W. The mycelium of a kind of "dry-rot," but no name can be given to it in the imperfect stage. M. C. C.

FUNGUS: W. B. H. *Agaricus* (*Pholiota*) *spectabilis*, never eaten, but not really known to be poisonous. A very different thing from the Beefsteak fungus. M. C. C.

GARDENER'S PERQUISITE OF HOUSE COAL: B. B. When the gardener resides on the place, and there are glasshouses to be heated, it is customary, in the London district, for the employer to supply coals. When the gardener resides off the premises coals are not given, but then the wages are increased in proportion.

INSECTS IN POTATO LAND: W. A. C. Those sent are millipedes (*Julus guttatus*), which feed on decaying vegetable, and more or less on animal matter. Trench the land deeply after dressing it with gaslime and soot. Set traps of Potato and Carrot, 6 inches deep, and 2 feet apart over the land. The creatures are not injurious to any great extent to living plants. Keep the ground stirred with the digging-fork when it is not covered with vegetation.

LILUM AURATUM: E. W. R. The deeply-coloured variety is the somewhat rare *A. rubro-vittatum*.

MEDLARS: R. S. M. Gather when ripe—that is, when they part easily from the shoots, and store them like Apples till they are bletted, and not before this change takes place are the fruits fit for consumption or making jelly. Jelly is made in the ordinary manner, but it should be strained to clear it of the cores and stones.

NAMES OF FRUITS: J. Boltrill. Apples: 1, Red Astrachan; 2, Irish Peach.—Ignorant. 1, Not sufficiently developed to recognise; 2, Windsor? 3, Lemon Pippin; 4, Williams' Bon Chrétien. Hamilton. 1, Ecklinville seedling; 2, Bramley's seedling; 3, Emperor Alexander; 4, Duchess of Oldenburgh; 5, Lord Suffield; 6, Alfriston.—A. L. Peaches: 3, Noblesse; 4, Bellegarde. Nectarines: 1, Stanwick Elruge; 2, Violette Hative. Peaches are difficult subjects to name with certainty.—Macom. 1, Early Red Juneating; 2, Irish Peach; 3, Red Quarrenden; 4, Lord Suffield.—A. P. The Grape you send is a most agreeable one. The skin is thin, flesh juicy, and of pleasant sweet flavour. It is Royal Muscadine, a very variable Grape, according to locality and conditions of treatment. It is sometimes more richly flavoured than those you send.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—H. W. 1, *Davallia hirta cristata*; 2, *Adiantum elegans*; 3, *Adiantum Waltoni*, both garden varieties; 4, *Adiantum concinnum*.—J. B. W. *Lycaste Deppei*.—R. N. H. 1, *Oncidium prætextum*; 2, *Oncidium Forbesii*; 3, *Odontoglossum Wallisii*.—J. C. & Co., Bradford. The abnormal flower of *Cymbidium Lowianum* is very singular in having two perfect and one imperfect labellum. The other is the racemose form of *Cynoches peruvianum*.—Fr. de Laet. *Basella rubra*.—J. Wright. *Erigeron aurantiacus*.

NARCISSUS FOR MARKET: H. A. D. The following varieties, amongst others, are grown by a most

successful market gardener:—Emperor, Princess, Golden Spur, Tenby, Edward Horsefield, bicolor grandis, Minnie Princess, Mary, Cynosure, Barri conspicuus, Stevenson, Maurice Vilmorin, poeticus, variety postarum, John Bain, Orange Sulphur Crown, Nelson Major, J. B. M. Madame de Graaff, Captain Nelson, C. house, Beauty, Gloria Mundi, Leedsii, Mrs. Langtry, Duchess of Westminster, White Japanese Anemone and *Gladiolus* are demand in the market. Whether the produce will pay or not must depend upon the management and astuteness to grasp the peculiarities of the market, which will help dispose of your produce at the best price.

NUTS: St. A. Filberts should be gathered with husk has almost entirely changed from a brown colour; if left till quite brown, it will drop out of the husk. Spread the paper or clean garden-wa's in a vinery or for a fortnight, afterwards storing the thin layer on the fruit-room shelves; if not intended for long keeping; the latter, put them into large clean pl. whelming another large pot, or some large slates over these, and keep in a cool, not cellar, or bank them over with modern earth or sand. The object aimed at is to kernels from shrivelling, but without germination during the winter, and the early decay. Some persons slightly spritz Nuts with salt when storing them in pots.

ORNAMENTAL FENCE, NORTH SIDE OF A ROCK: X. Y. Z. *Barbaris*, *Darwinia* as you suggest answer admirably for covering the fence, if fastened to it; *B. senophylla* would like well, and it flowers abundantly. Some of the growing *Ivies* would answer the purpose. *Canariensis*, *rhomboides*, *digitata*, *poetica* the spot is not reached by the sun, *Rosa* not likely to give satisfaction. If you are in a southern county you might plant *sil* double-flowered *Camellias*, and *Escallonia* against the fence.

PATUNIA BLOOMS: J. W. There is nothing able in this seedling variety.

PITIOSPORUM EUGENIODES: T. C. H. This can be easily propagated from seeds cuttings. The latter may be either half ripened, and should be inserted in light s in a close propagating-case, in a temper from 55° to 60°. Shade until roots are The nurseryman sometimes propagates from eyes also, just as the Americans do. In this system, though more economical, considerable care and experience.

SHOW GOOSEBERRIES: J. G. Red: A. Bollin Hall, Conquering Hero, Dan's Eskender Bey, Highlander, London, Slaug Speedwell, Talfourd, Wonderful. Yellow date, Catherine, Criterion, Drill, Hue, Leveller, Leviathan, Mount Pleasant, P way, Trumpeter. Green: Fearless, Green London, Lofly, Matchless, Plunde Stockwell, Telegraph, Thumper, Tom Join out. White: Antagonist, Brackley Hero, Coppice Lass, Freedom, Hero of the Nil Lind, King of Trumps, Queen of Trump drift, Snowdrop.

TOMATO DISEASED: J. P. The fruits affected with *Cladosporium Lycopersici*, Spot," a pernicious fungus, described an in these columns, October 1, 1887. The known cure, but the fungus may be kept early dressings of the Bordeaux Mixture temperature and dryish air, with ventilat and day, weather permitting.

WIREWORM AND PARASITE: S. & S. Th attached in two parallel rows to the be wireworm are pupæ of minute Hyme parasite, which as larvæ lived inside. Interesting case, and I will endeavour to perfect insects, and discover to what sp belong R. McL.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 11, 1897.

PIORA.

BUT it is time to come to the flowers, and in speaking of them I feel almost compelled to speak in what might well be called exaggeration and with a too great use of superlatives; but it is really impossible to speak of the flowers of Piora without using superlatives, and what seems like exaggeration. Before I left England I had been told by more than one friend well versed in flowers generally, and especially in alpine flowers, that in no part should I find such a paradise of flowers as at Piora. So I went in faith, and they really far exceeded my wildest expectations. I took with me Gremli's *Swiss Flora for Tourists*, published in English by Nutt, in the Strand—a most excellent little book, which I can strongly recommend to all who go to Switzerland in search of flowers. I can also recommend, but not so highly, Correvon's *Flore Colorée de Poche*, published in Paris. It has some fairly good plates, which are helpful, but it only records the more conspicuous flowers, and is not exhaustive, as is Gremli's. Now, Gremli describes 2637 Swiss plants, including Ferns and grasses, but without the mosses, fungi, and lichens, which of themselves must be a study; and I feel quite sure that within a radius of 3 miles or less from my hotel it would be quite possible for a good searcher to find more than one-half of these 2637 plants. I was not searching for plants, I simply admired and gathered those that were near the paths in my rambles; and yet the number of different plants that I saw—many of them seen wild for the first time—were a constant delight, and a delight that was varied every day and in every walk. It was not only the large number of species, but it was the large number of the individuals of many species that was to me so remarkable and noteworthy. I will name a few. The *Gentiana acaulis* was a little past its best, but it was still abundant; and I am not exaggerating when I say that during the week I was there I must have walked over acres of the gem-like *G. bavarica*. I had no idea that I could anywhere see it in such masses, and it seemed to be in no way particular as to its position; it was abundant, and perhaps most abundant, in the damp ground near the lakes, but it was also found in many high places. The whole place was especially rich in *Gentians*; besides the *G. acaulis* and *bavarica*, there was *G. lutea*, *cruciata*, *punctata*, *asclepiadea* (not yet in flower), and *germanica*. This last one I was especially pleased to see: it is a British plant, and I know it well, especially on the Cotswolds. But there is a great difference between the British and the Swiss plants, and it is a difference which shows how largely the colour of flowers is affected by their soil, situation, and especially, perhaps, their elevation. In England

the flower is a pale blue; at Piora the colour is as brilliant as that of *G. bavarica*, which it so much resembles at first sight that it is not till you take the plant in your hands and see that it has an annual root, and that it has many flowers in its little stem instead of the one flower that *G. bavarica* carries, that you see the difference. As with *G. bavarica*, so it was also with the Bird's-eye Primrose (*P. farinosa*). It was everywhere in hundreds, and you could not help treading on the little beauty. I do not think it was finer than I have seen it at Malham and Ingleborough, in Yorkshire; but I saw many specimens of a far richer and deeper colour than I have seen in England. The alpine Rose was everywhere, and was in its fullest beauty at that high elevation, though near Hospenthal it was almost past flowering. I delight in the Alpenrose, not only for its bright flowers, which give such a colour to so many Swiss hill-sides, but because it is the only *Rhododendron* (except *R. dahuricum*, which some consider only a geographical variety) that will grow on soil charged with lime. To me the faint smell is rather pleasant, though to some it is quite unpleasant; and at Piora I learned two facts about it which I had not noted before. There is here and there wet marshy ground on the hill-sides, not bad enough to stop a walker, but enough to make his feet damp. I noticed that wherever I could see an Alpenrose the walking was good and firm, though it may have appeared to be growing in a marsh. The other thing I learnt about it was, that it gives most valuable protection to many plants. I suppose it is not grazed by cattle, sheep, or goats, and the result is that many good plants come up right in the midst of the bushes, and are, I suppose, protected by them. I found many grand specimens of *Aquilegia alpina* growing thus; also *Streptopus amplexicaulis*, and others; and nestling round the outside of the bushes, and well protected by them, I found *Maianthemum bifolium*, *Pyrola rotundifolia*, and other gems. And I think it was worth all the journey to Piora if only to see the St. Bruno's Lily (*Paradisica liliastrum*) in flower. The first flowers were showing themselves when I was there; but I am told that when in full flower the hill-sides are white with them, and that they can be gathered in sheaves. I have grown it for many years and admired it, but I never realised its supreme beauty till I saw it on its native hill-sides. There surely can be no flower more thoroughly beautiful, while the whiteness of the flowers is the nearest approach to absolute purity that can be conceived. I shall never forget it as I saw it first at Piora. Growing with the St. Bruno's Lily, and in many other places, was a large quantity of the fine yellow Alpine *Anemone* (*A. sulphurea*), which I had seen before in its full beauty on the Furka Pass, where one hill-side was so covered with it that at a considerable distance the whole hill-side looked yellow; but at Piora the time of flowering was past, yet the beauty was not gone, for the heads with their many-feathered seeds were very beautiful.

It is very tempting to say more of the many beautiful flowers that I saw, but time and space would fail me—but there is one plant that I must on no account pass by. The Cobweb Sempervivum (*S. arachnoideum*) is everywhere, clinging to chinks in the rocks, and of wonderful beauty; there were many small patches of it which I could only compare to brooches set with brilliant jewels, the outside of each rosette being a pale rose, and the inside a glit-

tering spot formed by the cobweb that joins together every leaflet of each rosette. This likeness is increased by the fact that on all that I saw at Piora the rosettes were very small, and unopened, except to a small extent. I fancy that late in the year the rosettes expand and become flat, but they are so closely packed that it is hard to see how they can find room to expand. I was none the less glad to see the little beauty growing in such abundance and beauty, because I have never succeeded in growing it. In England it is a most capricious plant, growing well in one garden, and in another with apparently the same surroundings utterly refusing to live. And I must add another charm that the flowers give to the walks at Piora—there is an abundance of sweet-scented flowers. Among these there are two small Orchids of very delicate and pleasant scent—the little black Orchid, *Nigritella angustifolia*, and *Gymnadenia odoratissima*; the *Nigritella* being fairly abundant, and the *Gymnadenia* not so frequently met with. These, however, do not give out their scent till sought for, and so do not account for the pleasant smells that are met with in the walks unsought. Much of this comes from the Alpenrose; and after rain the Sweet Briar bushes scattered through the woods give out their well-known scent. But there are two low-growing plants which, as I think, fully account for the pleasant scents; the one is our own Thyme, which is everywhere. But I think the chief scent is given out by the pretty alpine Milfoil, *Achillea moschata*; it is very abundant, and when crushed gives an aromatic, musky smell.

For plant-collectors, as distinguished from plant-lovers, Piora is a delightful place. I was not collecting plants; I was simply looking for them to see them in their native habitats, and to admire them in their native beauty. But I wished I could have collected the native plants and taken them home, for I do not remember ever to have seen a place in which they could be collected so easily and with such almost certainty of success. The lower parts of the hills, which alone I examined, are composed of *débris* formed from the stones that have come down from the rocks above, and are covered with and permeated throughout by a rich humus, which is practically all decayed leaf-mould. The stones are not of a large size, and it is very easy to remove them; with a little help from the alpenstock they can one by one be removed, and then the root, though often penetrating the humus to a great distance, remains exposed, and the whole plant can be taken up without injury. And at Piora there is little fear of the most greedy collector doing any real destruction; he may help himself as largely as he likes with a very clear conscience, and he will do little harm for those who come after him. As an instance of the ease of taking up difficult plants there, I may say that the evening before I went away I wished to find some seedlings of the handsome *Gentiana punctata* which I had marked by the lake-side not far from the hotel, for I knew that a full-grown *G. punctata* has a big root which it is almost hopeless to attempt to dig up with any chance of success. I soon found the plants, and among them many little ones that seemed exactly what I wanted. But I soon found they were no seedlings; the little bunch of radical leaves concealed a root-stock more than an inch in diameter, and it took several minutes of work with the alpenstock to follow the root to the end, and then it turned out to be nearly a yard

in length, with many ramifications, but the nature of the soil allowed me to get all I wanted without any injury to the roots. All collectors should remember that it is of the first importance not to bruise or break any of the roots; if they are bruised or broken, Nature's first work is to heal the wounds, and while so doing little other work is done by the plant, and if they are badly bruised and are a long time out of the ground and so get dried, death is almost certain. Collectors should also remember that it is labour in vain with a great many plants to take them from a soil of one marked character and transplant them into another. All the plants at Piora grow in the *débris* of primary rocks at a high elevation; many of them, like the *Rhododendron*, will grow anywhere, but a very large number, the majority perhaps, will simply die when removed to a soil composed of lime or chalk at a low elevation. I feel sure that the mountain air is a great factor in the vigour and abundance of Alpine plants, and in many instances in the colour of the flowers, and cannot help thinking also that the reduced atmospheric pressure which the flowers get at high altitudes has its influence upon their healthy growth. *H. N. E., in the "Guardian."*

NEW OR NOTEWORTHY PLANTS.

LÆLIO-CATILEYA × BROOMEANA.

SEVERAL plants described as "remarkable *Lælias*" were imported from Brazil by Joseph Broome, Esq., of Sunny Hill, Llandudno, and this one now flowering fully bears out the description, though the question of its being a natural hybrid or of garden origin must remain unanswered. In certain particulars it has a resemblance to some of the finest forms of *L. C. × elegans*, although differing widely in having petals which differ in shape from any form of that variety, and almost as broad as those of some of the large-flowered *Cattleyas*. The lip, too, differs, the front lobe being merely separated from the side lobes as though by a notch on each side, and not carried forward on an isthmus, as seen in some degree in forms of *L. C. × elegans*.

The flowers measure about 6 inches in width; all the segments are well displayed, and of good substance, and bright colour. The sepals are 1 inch wide, and 2½ inches long; the petals ovate, and not pointed, as in other varieties which might be classed with it; nearly 2 inches in width, and 3 in length. Both sepals and petals are of a clear rosy-mauve colour, the petals furnished with slightly darker veining. The side lobes of the lip are pure white, the tips coloured purple-rose. The broad, flat front-lobe of the lip is of a rich crimson-purple colour, a purple band extending to it from the base, and its surface bearing a raised veining of claret colour, with a slight tinge of orange. It is one of the finest and most distinct of its class, and it is a pity that its origin cannot be more definitely stated. *James O'Brien.*

CHERRIES, THEIR CHEMICAL COMPOSITION.

BEFORE the Cherry season of 1894, requests were made by the authorities of the College of Agriculture of California, to a number of prominent orchardists for average samples of Cherry varieties grown by them. A few were received in full-ripe and excellent condition, and submitted to analysis, with results as follows:—

No. 1. Variety Royal Ann, from Chico, Butte County.—The Cherries were in excellent condition, quite large, and marked in colour as characteristic of the variety; the flesh was hard and firm, and easily separated from the pit, juicy and sweet.

No. 2. Variety Black Tartarian, from Chico.—A typical sample of the variety.

No. 3. Variety Royal Ann, from Newcastle, Placer County.—A pleasant-tasted fruit, somewhat smaller than that received from Chico (No. 1), but beautifully marked.

No. 4. Variety Black Tartarian, from Newcastle.—A very sweet Cherry, though smaller than the others examined of the same name; colour good.

No. 5. Variety Black Tartarian, from San José, Santa Clara County.—A very sweet fruit, somewhat larger than the Newcastle sample (No. 4), and resembled much in colour and size that grown at Chico (No. 2).

No. 6. Variety Napoleon Bigarreau (Royal Ann), from San José.—In size much like the other Royal Anns, but of higher brown colour, which spread over the surface of the fruit, giving it a rich appearance.

The largest Cherries were found to be Royal Ann, from Newcastle and San José, respectively, of which 54.1 made a pound. The smallest was the Black Tartarian, from Newcastle, which required 72.9 to make a pound.

The highest flesh percentage was found in Royal Ann, from Newcastle, 93.7 per cent.; that of Royal Ann from Chico coming very near to it with 96 per cent. The Black Tartarian from San José contained the least flesh, viz., 94 per cent., but at the same time was the juiciest fruit. The driest flesh was that of the Royal Ann from San José (No. 6), which had but 79.1 per cent. of juice in the flesh. Nos. 3 and 4 possessed but little advantage in this respect over No. 6, yielding about 81 per cent. juice in the flesh.

Of sugar content in the whole fruit there were some differences, but not so great as found in some other fruits. The Black Tartarian Cherry from San José (No. 5) yielded the most sugar, 12.75 per cent., and this was the most juicy Cherry examined. Aside from this sample there was but little choice, as the others showed upwards of 10 per cent., leaving out the minimum, viz., 8.98 per cent., found in the Royal Ann from Chico (No. 1). These Cherries, with an average of 10.96 per cent. sugar, resemble Apricots, which average at this station 11.1 per cent. sugar. European-grown Cherries show 10.24 per cent. sugar in the fruit, this being one of the few instances where European and Californian fruits show agreement in this important ingredient.

Of acid there was no great variation noted, ranging from 0.3 to 0.5 per cent., or about as much in amount as is quoted for Californian Prunes, Plums, and Peaches.

Nitrogenous materials (albuminoids) exist in the flesh or edible portion of Cherries in a very considerable quantity. We note a variation in the albuminoids of the flesh of Cherries of from 1 to 1½ per cent., giving an average of 1.2 per cent. for all, being the same as is given for Apricots. This figure, viz., 1.2 per cent., is the highest for these nitrogenous materials, excepting that of Figs, which show 1.5 per cent., and therefore places the Cherry, as compared with other, on a high footing as to content of flesh-forming matters.

König gives, as an average of nine analyses of European Cherries, only 0.67 per cent. albuminoids in fresh fruits, or about one-half as much as found in the Californian Cherries.

The ash-percentages of Cherries are remarkably alike, averaging 0.44; only one lot, No. 6 (Royal Ann), reaching over half per cent., with 0.521. Nor does this fruit withdraw from the soil any more plant-food material than do Prunes, Plums, and Apricots, which contain respectively 0.486, 0.62, and 0.508 per cent. ash. Turning now to the composition of the ash of Cherries, it was found that over one-half is composed of potash, and that the next largest ingredient was phosphoric acid, 15.11 per cent. Only one other fruit-ash—that of Grapes—contains more phosphoric acid, or as 21.24 per cent. against 15.11; Prunes come next, with 14.08 per cent. phosphoric acid in ash.

As to lime in the ash, the Grape, Prune, Apricot, and Cherry, all show about 4 per cent.—very much less than that in the Orange, Lemon, and Fig ashes. Sulphuric acid in the Cherry-ash is high—even more than quoted for Oranges—5.83 against 5.25 per cent.

Composition of the Ash of Cherries.

Constituents.	Black Tartarian Cherry from San José, California.	European Cherry.
Percentage of ash in fresh fruit ...	0.482	0.20
Percentage composition of ash:—		
Potash	57.67	51.5
Soda	6.80	2.19
Lime	4.20	7.47
Magnesia	5.49	5.46
Iron oxide	1.12	1.98
Manganese	0.82	...
Phosphoric acid	15.11	15.97
Sulphuric acid	5.83	5.09
Silica	1.13	0.04
Chlorine	1.33	0.95

Taking the figures as given for the Californian Cherry, it is found that this fruit extracts from the soil by its growth the following amounts of nitrogen, potash, phosphoric acid, &c., in each 1000 lb. of fresh fruit as gathered.

Soil Ingredients abstracted by 1000 lb. of Fresh Cherries.

Nitrogen	2.29 lb.
Potash	2.77 "
Phosphoric acid	0.72 "
Other ash ingredients	1.33 "

These figures are very similar to those required for the same weight of Apricots; it may, therefore, be concluded that for Cherries, when manurial fertiliser becomes necessary, a nitrogenous as well as a phosphatic manure will be required first, leaving the potash fertiliser to follow at a later period.

The high sulphuric acid contents in the ash of the Cherry, as in that of the Orange, may suggest the early use of a dressing of superphosphate of lime, gypsum, or old mortar rubbish, as these will help to make available the potash already present in a latent condition in the soil. *J. J. Willis, Harpenden.*

NEW VARIETIES OF CARNATIONS.

It has been urged repeatedly by amateur florists, that in order to obtain success in the cross fertilisation of plants, one subject only should be dealt with. Mr. Martin R. Smith has worked with the Carnation only, and has thoroughly mastered the intricacies connected with the cross fertilisation of that plant. His work in producing from seed a new type of Malmesbury Carnation is evidence of originality in one direction; but he has also marked out a new line, all his own, in border Carnations, and has advanced quite as far in this section, having produced varieties possessing qualities in the form and colour of the flowers, and in the habit of the plants hitherto unknown. Nothing at Hayes is left to chance, and a record is kept of all the crosses made, which are carefully tabulated.

The experience thus gained had led Mr. Martin Smith to a strong belief in the prepotency of the pollen-parent, a belief, however, which has been somewhat shaken by the results obtained from this year's seedlings, a very large number of which have closely followed their seed-parent in habit, form, and colour.

The importance, however, of this negation of previous experience is, in Mr. Martin Smith's opinion, much diminished by the practical impossibility of knowing with certainty what pollen has really fertilised the seed. The flower may have been self-fertilised or affected by pollen carried by the wind before being crossed by the operator. A few instances, therefore, in which the influence of the pollen-parent is plainly discernible, are more convincing to the mind than would be many apparently pointing to an opposite direction, as the value of such results is always neutralised by the doubt which will fail to arise as to whether the cross was in very truth what it professed to be.

A few results have been obtained which may be considered practically established: for instance, that the crossing of parents of the same colour, rose with rose, scarlet with scarlet, or yellow with yellow, will produce a very large preponderance of seedlings of the same colour; but when parents of different

FIG. 49.—FANCY CARNATION HIDALGO.

Exhibited first in 1896. Size of bloom 3 inches; yellow ground, streaked and margined with crimson. (See p. 174.)

FIG. 51.—CARNATION CINNAMON.

Size of bloom 3 inches; colour cinnamon or apricot; petals large, and smooth on the edges. (See p. 174.)

FIG. 50.—FANCY CARNATION CZARINA.

Size of bloom $3\frac{1}{2}$ inches; deep yellow ground, margins marked with red lines. Flowers large and full. (See p. 174.)

FIG. 52.—CARNATION: REGENT.

Size of bloom 3 inches; buff ground-colour, heavily marked with purplish-red. (See p. 174.)

colours are used, their progeny will be found of every conceivable tint, and experience so far can trace no rule or method in the matter.

Further, it would appear that the crossing of two strongly-opposed colours, such as yellow and purple, yellow and maroon or scarlet, has a distinct tendency to produce white.

The inter-crossing of yellow ground fancies will result in an almost exclusive return of yellow ground fancies, and as is well known the inter-crossing of flakes or bizzars will give a vast preponderance of flowers with the same distribution of colour.

Yellow would appear to be the least stable of all colours, for the use of pollen from a variety of any other colour will, as a rule, entirely displace the yellow in the progeny; and in a cross of yellow upon a seed-parent of any other colour, but few, if any, yellows will be found among the seedlings. The prepotency in this case of the pollen parent will, as regards colour, be found without evidence, but may be clearly demonstrated in habit, petal, or calyx.

The usual tendency to "throw back" is observable, and Mr. Martin Smith mentions that from the crossing of a scarlet and a white, both seedlings from Germania, he this year obtained several yellow selfs.

It is certain that the whole of the seeds in the same pod are not equally affected by the pollen-parent. Some of the seedlings from it will be found bearing strong and undoubted evidence of the cross, and these will generally prove to be the pick of the lot; whilst others will take after the seed-parent, and a large percentage will show a tendency to revert to the "single" form from which the parent was originally developed.

In considering, therefore, the value of a cross between any two varieties, it is necessary first to eliminate much that is moderate or inferior. If but one seedling in a hundred is produced of very superior merit, and there is evidence that it is the genuine produce of the two varieties used, the value of the cross must be fixed by that one good seedling, and not by the ninety-nine which have had to be thrown away.

What Mr. Martin Smith is now striving for is good constitution, compact habit of plant, flowers standing boldly erect on stout footstalks and of good outline, and the outer petals smooth, well formed, and that do not reflex.

The six flowers we have figured on pp. 175, 177, were photographed by Mr. Stanley Wrightson, at Great Bookham, in the nursery of Mr. J. Douglas, who has taken over the available stock of the new Hayes seedlings. The varieties are a selection from 150, all named and classified with the greatest care. The flowers are slightly reduced in size.

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 63 to 69)

WALES.

(Concluded from p. 160.)

CARDIGANSHIRE.—On the whole the fruit crops in this district are very poor, and especially Apples. There was a grand show of blossom, but cold winds and late frosts ruined them. Bush fruits have been very plentiful; Strawberries were good, but did not last long. *R. T. Williams, Crosswood Park, Aberystwyth.*

DENBIGHSHIRE.—In this garden Apples are a grand crop; the variety Starmer Pippin has failed, but this bore a very heavy crop last season. Pears are good, too, exceptionally so the varieties Williams' Bon Chrétien, Marie Louise, Doyenné du Comice, Beurré Diel, Beurré d'Amanlis, Beurré Superfin, Jargonelle, Josephine de Malines, Louise Bonne of Jersey, Marie Louise, and Catillac. *P. Fairbairn, Wynnstay Gardens, Ruabon.*

— Early and late Apples are excellent crops. Mid-season varieties were damaged by the frost when in bloom. Ribston Pippin and King of the Pippins are the best cropped among late varieties. *Henry Forder, Ruthin Castle Gardens, Denbighshire.*

GLAMORGANSHIRE.—Fruit-trees here never looked better than they did this spring; they were clean and

healthy, and free from insect pests of all kinds. Apple, Pear, and Plum trees were one mass of blossom, and promised well for an abundant crop; but the fruit did not set well, and a great many of the Apples dropped after they had grown to the size of pigeons' eggs. Of Apples, Lord Suffield, Cox's Orange Pippin, Ribston Pippin, King of the Pippins, and Alfriston are carrying good crops; while most other varieties have not more than half a crop. Pear-trees on walls and pyramids in the open quarters have about half an average crop. Plums are a complete failure. Strawberries were plentiful, and good in quality. *A. Pettigrew, Castle Gardens, Cardiff.*

— The fruit-crop in this district is much under average, especially Pears, Plums, Cherries, Peaches, and Nectarines. I never remember to have seen Peach-trees in such a bad state, and the cold weather in May killed many of the shoots. Apples in some gardens are a heavy crop, and the trees look clean and healthy, but in others there is much scarcity. All small-fruits have been plentiful. *R. Milner, Penrice Castle.*

MONTGOMERYSHIRE.—The season opened with great promise, there was an abundance of blossoms, and they were uninjured by frosts; but cold easterly winds following caused the leaves to blister, and the trees became badly blighted. Owing to this check the fruits did not swell, and consequently they fell off in great numbers. Damsons are quite a failure. *John Lambert, Ponies Castle Gardens, Wd'spool.*

PENBROKESHIRE.—All fruit trees bloomed well this season, and there being a total absence of spring frost a good crop of fruit was anticipated. But the weather was cold, wet, and sunless during the blooming period, and the fruits set badly. Then there was a sudden change to heat and drought, and most of those that had set dropped off. We have an average crop of Apples, the best being King of Pippins and Alfriston. *Geo. Griffith, Slebeck Park Gardens.*

— The following varieties of Apples are bearing good crops: Adams' Pearmain, Bramley's Seedling, D. T. Fish, Keswick Codlin, Lady Henniker, Lord Suffield, Ecklinville Seedling, Margil, and Tower of Glamis; all varieties of Pears are very thin, and the fruits small. *W. B. Fisher, Starkepole Court Gardens, Pembroke.*

IRELAND, N.

GALWAY.—The fruit crops, with the exception of small fruits, are almost a failure. Apples, Pears, Plums, and Cherries bore very heavy crops last year; this circumstance, combined with a very wet and sunless autumn, left the trees exhausted, and the wood badly ripened. The blossom was consequently unable to withstand the long period of cold and wet in the spring. *John Cobban, Garbally Gardens, Ballinasloe.*

KERRY.—The spring of this year was the most disastrous for outdoor fruit that I remember. There was an abundant show of blossom on all kinds of fruit trees, but for nearly three weeks there was cold weather, with hail and snow, and only the late-flowering Apples and Pears set any fruit. *Geo. R. Breeze, Killarney Gardens, co. Kerry.*

WESTMEATH.—The fruit crops in this district are on the whole fairly satisfactory. Apples are a fair crop, Lane's Prince Albert, Cox's Pomona, Ribston Pippin, and Blenheim Orange, being especially abundant and of good quality. Pears also are very good both on walls and standards, a few standard trees of the market variety, Heale, being weighed to the ground with fruit. The growth on Apples, Pears, Plums, and small fruit trees is exceptionally clean, strong, and healthy. *Robert Anderson, The Gardens, Waterstown, Athlone.*

WICKLOW.—In the early spring we had great promise, but the bitter east winds that prevailed here during April and May proved most damaging to the crops, especially to Plums, Pears, and Cherries. Of Raspberries we have had a very heavy crop of good fruit. Carter's Superlative is the favourite variety here. *D. Crowley, Powerscourt Gardens, Bray.*

IRELAND, S.

KILDARE.—The fruit crops are under average, owing to the severe frosts of March 30 (12°) and April 2 (11°), both of which were of ten hours' duration. Varieties of Apples carrying full crops are Lord Suffield, Blenheim Orange, and Northern Greening, and these all carried heavy crops in 1895 and 1896. *Fredk. Bedford, Straffan House Gardens.*

KING'S COUNTY.—The fruit crops are very indifferent; Cherries, Plums, and Pears are very few and poor in quality; whilst Peaches on open walls are a total failure, although there was an abundance of blossom. *T. J. Hart, Birr Castle Gardens, Partiltown.*

LIMERICK.—The present is the most unfavourable fruit season I have experienced. Pears looked very promising when in bloom, but cold east winds with frost set in, destroying the pollen, so that we are practically without Pears of any variety. Apples are only a partial crop. *J. Ellicott, Summerville Gardens, Limerick.*

CHANNEL ISLANDS.

GUERNSEY.—The crops of out-of-door fruits are abnormally poor. The trees bloomed fully two weeks earlier than in the two previous years. This of itself was a danger, but the subsequent weather has completed the evil, for it has been cold and cheerless—so much so, that the crops are now ten or twelve days at least later than in an ordinary season. Many of the fruits did not set well, those which did, advanced but little for a considerable time. *C. Smith & Son, Caledonia Nursery.*

JERSEY.—Apples are an abundant crop, the trees being loaded with fruit. Pears are scarce, owing to wind and frost when the trees were in bloom. All stone-fruits have failed. *Edwin John Ashford Nurseries, Queen's Road, St. Helier's.*

ISLE OF MAN.—The prospects of an excellent fruit crop were good early in the season, but the persistent cold and wet, and the high winds during June caused a very large proportion of the Apples, Pears, and Cherries to fall prematurely. Strawberries have been fine, and of good quality. *J. Murphy, Cronk-lourne Gardens, Douglas.*

BELGIUM.

EXHIBITION OF THE ANTWERP ROYAL HORTICULTURAL SOCIETY.

THE 166th exhibition of the above society was held in the new and handsome premises of the Royal Zoological Society, and was very successful.

The programme included non-competitive exhibits and others for competition; the former were the most numerous and important, many being contributed by Antwerp horticulturists who had not previously exhibited.

Two consignments of plants were particularly noticeable, that of about two hundred specimen plants sent by M. Florent Pauwels; the other from M. J. I. De Beucker, consisting of a series of representative plants illustrating the various forms of the globe, mingled with a dozen floral decorations, ranging from a bunch of Thistle bloom to an elegant arrangement of Lillium Harrisii and spathe of Anthurium.

The society instituted a new award for this exhibition, namely, a diploma of artistic merit to be awarded to the exhibitors whose arrangements showed good taste. Four diplomas were allotted; for plants and flowers from M. J. I. De Beucker; for the floral sprays of M. J. Smets-Troyman; the cut flowers from M. Raes-Daems, and fourthly to the planner of the exhibition, M. Guillaume De Borschere, who had successfully and artistically contrived the general arrangement of the hall.

A Certificate of Merit for rarity was accorded to M. F. De Laet for Echinocactus Trollietii. A cultural Certificate was awarded for Echinocactus Wislizeni and for Anthurium Rothschildianum, from M. A. De Smet.

be taken from house-grown plants, and undoubtedly the Tea, Tea hybrid and Noisette Roses are readily increased by this method.

Rose stocks for forming dwarf plants are universally raised by this method. The cuttings of ripe wood are taken in the autumn, and laid in by the heels till a wet or severe frosty day makes it necessary for an indoor job to be found for the men.

The Italian (Manettiae) stock is the one generally used. The cuttings are made from 9 to 10 inches long, and the lower buds cut off, leaving only two or three at the top of the cutting. They are then lined-in about 2½ inches apart in a sheltered border, and well trodden-in, and a sifting of cocoa refuse spread evenly over the soil among them to make a neat finish, and to keep an even temperature, and the moisture in the soil. Most of them will strike, and early in the following autumn every other plant may be lifted for potting to use for inside grafting, and those left will take a bud in June or July; but it is the practice to take out the soil to the depth of 3 or 4 inches so that the bud may be inserted below the ground line; and when this has started and somewhat hardened to fill up the soil level, covering the union, and so, in most cases, encouraging rooting from the base of the bud.

Speaking candidly, it is a pity the Manettii is so free and easy of propagation and working, for, except for a very few Roses, it is a most unsatisfactory stock. It is true the plants grow very vigorously in the first year, but each succeeding one they get weaker, and at last may be said simply to exist; while the stock, being of a very irrepressible nature, is constantly throwing up strong suckers from the bottom and killing the bud.

Many amateurs, and I might also say gardeners, cannot distinguish the stock from the Rose, and so in time—alas! a short time—the Rose-bed becomes all Manettii. A simple and efficient means to distinguish the stock from the Rose is that most, I may say all, H. P., Tea, and Noisette Roses have compound leaves, with two pairs of opposite leaflets and one terminal—in all, five; but the Manettii and multidora Roses, including Turner's Crimson Rambler, have seven, viz., three opposite pairs and one terminal. My advice to the gardener and amateur is, put a ban on Manettii stocks, using by preference the native wild Roses, *R. canina* and *R. arvensis*, either as seedlings or cuttings. I have had most satisfactory results from Briar cuttings which are thus made, and may be generally cut in plenty from the beds of standard Briars. Generally two or three laterals are allowed to each Briar, but two are ample; one finally, all good rosarians will say.

Remove all the superfluous ones, cutting close to the main stem, so as to secure a heel, and then shorten to about 6 inches. Line-in these cuttings about 3 inches apart, and tread up firmly, when most of them will root and be fit to take a bud the next June or July. Any weak or badly-rooted ones may be potted and then plunged for winter grafting. The next most generally useful Rose stock is the "Grifferaie," or, to give it its full title, Multiflora de la Grifferaie, which roots freely from cuttings of the ripe yearling wood, cut at a node, the cuttings being made about 8 or 9 inches long, disbudded at the base, and two-thirds embedded in the soil of the cutting-border; they may be budded as they stand, or be transplanted. On this stock all the strong-growing and climbing Tea and Noisette Roses can be worked, and the smooth-wooded perpetuals, such as Marie Finger, &c.

There are two more Rose stocks employed by French and some English growers to bud Tea Roses upon, one of which is desirable, as it not only imparts a neat pyramidal form to the bush, but causes a short and compact habit of growth, and great freedom of flowering. This is known as the Napoleon stock (*Rosa laxa*); on it such Roses as Madame Chedane Guinoisseau, Marie Van Houtte, and other useful Teas, make beautiful plants for pot-culture; and the last is *Rosa polyantha*, which is good for some Teas, and for all Noisettes, as well as for their hybrids. Both of these may be readily propagated from cuttings of the ripe wood, taken just at the fall of the leaf. *Experience.*

(To be continued.)

AMERICAN NOTES.

REFORESTATION.

A GREAT deal of interest in forestry subjects is being manifested in certain quarters. The efforts to secure a more reasonable management of the forests on public lands are especially strenuous. Of course, the present negligent apathy is due chiefly to ignorance of the value of the public woodlands, and of the feasibility of their systematic management. Any contribution to our knowledge of the actual facts is therefore especially timely. One of the best of recent publications dealing with such matters is a bulletin discussing the "Rate of increase on the cut-over timber lands of Minnesota," and issued from the Minnesota experiment station by Professor S. B. Green and Mr. H. B. Ayres. Besides giving acceptable statistics as to the extent and composition of the valuable lumber forests of Minnesota, the special question of the rate of increase on cut-over lands is answered as well as may be by giving several careful measurements. From these it appears that White Pine (*Pinus Strobus*, Linn.), left as scattering trees after logging, and cut at the age of 100 years (elapsed time since logging not given), has made an average annual increment of 1.5 cubic feet during the last ten years. White Pine first crowded, and then set free by fire, 125 years old, has given an average annual increment during the last ten years of .89 cubic feet. White Pine grown in the open, fifty-six years old, has made an average annual increment of 1.25 cubic feet during the last ten years. Norway Pine (*Pinus resinosa*, Ait.) left after logging, and cut at the age of 128 years, shows an average annual increment for the last ten years of .79 cubic feet. Norway Pine grown in the open (age not stated) gave an average annual increment of .96 cubic feet for the last ten years. Tamarac (*Larix americana*, Michx.), second growth, thirty-eight years old, showed an average annual increment of .46 for the last ten years.

APPLE CROP OF 1897.

As was expected, the Apple crop of the present year is considerably below the average. The Secretary of the National Apple-Shippers' Association estimates it at 60 per cent. of a full crop. The quality of the crop is not likely to be better than that of last year. The quality last year was good in spite of the large crop, but this year has been marked by weather favourable to the spread of fungous diseases and insect pests. Apple-scab is very bad in unsprayed orchards; but, fortunately, nearly all the commercial growers in America spray carefully every year. It seems probable that the price for first-class fruit this year will be considerably higher than last. Last year the English export market was demoralised by excessive shipments of poorly graded, poorly packed, poorly ripened fruit, for which shipping and storage facilities were quite inadequate. The Dominion government has now completed the arrangement of cold storage houses in connection with cars and boats from all parts of Canada direct to Liverpool, London, and other English ports, and this may have some influence on the disposal of the ripening crop.

QUEBEC POMOLOGICAL.

The fourth annual summer meeting of the Quebec Pomological and Fruit Growers' Association was held on August 17 and 18, at Stanstead, with a moderate attendance. The territory represented by the membership of this Society comprises the coldest Apple-growing region of North America. Indeed, it has been only by the most strenuous search after the very hardiest varieties that Apple-growing has been made a success at all. The fact that Apple-growing has at last succeeded in a commercial way, is a remarkable testimony to the patient enterprise of the Quebec horticulturists. The winter of 1896-97 was a very severe one in this region, owing partly to a lack of snow-covering on the soil. Many old orchards of supposedly "iron-clad" varieties were so badly decimated as to require replanting or complete destruction. Such an amount of winter-damage is

however, very exceptional, and fruit-growers be deterred from further planting. The varieties of Apples have been widely distributed throughout the province in answer to the demand for something especially hardy, and such sorts as Transparent and Duchess of Oldenburg have a some commercial importance. The writer has the privilege lately of visiting the old farm of Charles Gibb, at Abbotsford, Quebec. Mr. Gibb is one of the first and most prominent importers of Russian fruits in America, and the orchard he left, and which are now in the hands of J. Craig, are a very interesting memorial of his. Many of the trees which he planted are now profitable crops. The Russian varieties, occupying the cold regions of Canada and the to the exclusion of others of American origin, they have served a very useful purpose in the experimentation in Apple-growing where people have not the faith to try native sorts. Russian Plum trees have met with but indifferent success. Russian Cherries have done a little better, but have not yet passed out of their probationary period. *F. A. Waugh.*

THE SOCIETY OF AMERICAN FLORISTS.

This body has held its thirteenth annual convention at Providence, Rhode Island. It was in respects a notable gathering, especially as to the attendance, but the topics for discussion presented in a very ordinary way, and actual discussion fell flat. Even the proposed change in title to "Society of American Florists and Ornamental Horticulturists," was handled in a desultory way. Mr. A. Herrington made a strong plea for the title of gardener, but the grotesque name submitted was eventually adopted. Now it is an established fact, everyone is asking what is an ornamental horticulturist? and the ludicrous side is being appreciated.

The fact is, the addition is made because the Society seeks a national charter, which was vetoed by President Cleveland on the ground that the interests of horticulture were not to be best served by a body of florists—which, of course, is a fact. Moreover, the Society has been, and is, in need of more funds, which may be supplied by increasing its membership; therefore its managers are open to it up to others than mere commercial florists. The cash of the gardener is sought, and some speakers were not sufficiently careful in expressing themselves in terms of disparagement about florists and vegetable raisers. They should remember at one time they themselves were nearly all way all-round gardeners.

Some time ago there was partly organised in New York a society for gardeners only, for many the craft wanted to maintain their individuality apart from the florists. Since its inception, however, it has been so grossly mismanaged, that the Society of American Florists has now a chance never before had, and it looks as though it will show an even greater vitality than it has at present. The feeling that the Society is to be the working florist was well shown in the election of the new President, W. F. Gude of Washington, D.C. He was sprung upon the meeting in opposition to a wealthy gentleman with large investments in commercial floriculture, and his election was by a large majority.

The next convention will be held in Omaha, Nebraska, and it will be the first time the Society has gone so far into the west. By meeting together with the surprise election of a President—a young man under thirty years of age—looked upon as the dawn of a new era, and scope for the Society's work.

The exhibition held in connection with the convention was chiefly remarkable for the display of Water Lilies and other aquatic plants. The one private collection from Mr. Oakes Ames, trade lot from Mr. H. A. Dreer, to whom they were made in the order named.

Rhododendrons and *Azalea mollis* raised in 1894 were represented by good-sized plants.

the trade is regarding the matter with some interest, as the present import duty on all plants is 30 per cent. *ad valorem*, which makes the foreign stock come dear to the buyer.

THE BULB SUPPLY.

The question of our supply of bulbs has again been introduced by C. H. Allen. It looks as if we shall soon be hard at it raising at home all the *Lilium Harrisii* that are wanted. It will be a serious blow to the Dutch if we take to raising our own bulbs—and why should we not? None can answer that.

POMOLOGICAL SOCIETY.

On September 1 the biennial gathering of that very important body, the American Pomological Society, met at Columbia, Ohio.

THE FRUIT-CROP.

The returns indicate that the Apples this year will be about 60 per cent. of last year's crop; this does not necessarily indicate any diminution in supply for the Liverpool and London markets, but rather that the out-of-the-way districts at home, which were reached last year in sheer desperation, will not be so well supplied.

TOMATOS.

The superiority of English Tomatos for forcing purposes as compared with the American varieties, is being more strongly impressed upon the craft. The one that has proved itself to be *facile princeps* is Best of All (Sutton's), which is fully 50 per cent. better in yield than the hitherto standard variety Lorillard.

POTATOS.

It is noteworthy in the respect that English Potatoes are a failure on the farms of the States. Repeated attempts at their cultivation have been made, but sooner or later—generally in a couple of years or so—the variety has dwindled away, and the "crop" does not equal the seed in weight. This year some better results may be reported, but the dreadfully wet season will account for the present results.

J. JAPANESE IRIS.

A recent visit to the nurseries of John Lewis Childs gave one an entirely new appreciation of the possibilities of the Japanese Iris (*I. Kämpferi*). Here have we been worrying ourselves about the supply of water at the roots when at Floral Park, New York. This plant is grown as a field crop—by the acre! High and dry on the edge of a railroad-cutting were to be seen the very finest blooms. Evidently wet feet are not a necessary condition for this most beautiful member of a gorgeous family.

FRUIT-CONSERVATION.

It is always a matter of surprise to the American housekeeper to learn that her English cousin does not "can." Fruits thus preserved for winter use are much more serviceable for a variety of purposes than jam. Here no housewife fails to put up in glass jars a liberal store of Apples, Pears, Plums, Peaches, Cherries and even Raspberries, Strawberries, &c. These can be used later for dessert or pie, and are almost equal to the fresh fruits. Tomatos are also thus stored. This process of canning is so called, I suppose, because no cans are used. The process broadly is first to get the glass jars well heated by standing them in cold water, which is brought to the boil, then to fill with fruit, cooking it till tender, then adding sugar to the juice that flows from the fruit, so as to make a syrup, then fill the jars quite full, and hermetically seal while still hot. Fruits thus preserved are so infinitely superior to the sickly, over-sugared jam, that the latter is but very rarely met with. The jars for this work are made with a screw metal top, lined with china, and a washer of india-rubber.

Mr. DAVID HOUSTON, Director of the Essex County Technical Instruction, has been visiting many of our eastern experiment stations on behalf of his Council. After inspecting the Government Department of Agriculture at Washington, he will continue his investigations. *An Old Correspondent.*

FORESTRY.

MIXED PLANTATIONS.

(Continued from p. 85.)

IN the formation of a truly ornamental piece of woodland, no better guide can be taken than Nature, and the first question the intending planter should ask himself is, what is the indigenous forest growth of the particular locality he has to deal with. This can easily be ascertained by the inspection of neighbouring woods and copses, or odd corners of ground which have been left to themselves for years, and are gradually becoming stocked with indigenous trees and shrubs. He will probably find a sufficient variety in these spots to enable him to pick out both timber trees and shrubs suitable for game cover; and the chief question to decide is the extent to which these particular species may be employed, keeping in view the particular objects for which the work is undertaken. One almost invariable desideratum in plantations of the usual kind is a quick effect, for the growth of a young plantation into a game cover, let alone its growth into a timber-yielding concern, is a comparatively slow business. Rapidity of growth in a species cannot, therefore, be overlooked altogether, and there is little doubt that, compared with many of our recent introductions, indigenous trees are at a decided disadvantage in this respect. Our native forest flora is also rather weak in evergreens, and here again it does not always satisfy the requirements of the gamekeeper in the way of shelter, or the landscape-gardener in imparting warmth and variety of foliage during the winter months. Conifers are practically the only class of tree at our disposal for this purpose, but their too frequent use either in the park or plantation, frequently nullifies any advantage that sought to accompany their use. All that is required from an æsthetic point of view, in any piece of woodland, is just sufficient alteration in the species and type of wood to prevent the eye from acquiring that familiarity in the scene before it which is said to breed contempt. Any greater change than this is a mistake, as it tends to destroy those peculiar features which are associated with a particular district, and which adapt themselves so readily to the physical features of a locality. It may be difficult to determine definitely the species best adapted for any particular site, but a close observation of the native habitat of both indigenous and exotic forest trees is the best way of avoiding error in this respect. Generally speaking, forest trees may be divided, from an ornamental point of view, into two classes—those which are seen to best advantage on sloping ground, and those which suit themselves more readily to a flat landscape. Amongst the former will be found the majority of Conifers, more especially such as are of a stiff and pyramidal habit of growth, while broad-leaved species are more frequently indigenous to plains and lowlands. This rule of course has many exceptions, for the same species which occupies the hill slopes and elevated ground in a warm climate will be found in the plains and low-lying land at higher latitudes. But in a general way it must be admitted that many Conifers not only thrive better in hilly districts than broad-leaved trees, but also have a far better appearance on a hill-side than the more spreading and flat-topped deciduous types. Of course a fine specimen of any species looks well wherever it may be, but we refer here to trees in woods and large masses, where the general effect is of more importance than that derived from individual trees. Spruce, Larch or Silver Fir, for instance, are more suitable trees for planting on steep hill-sides, or on the sides of deep ravines, than Oak or Beech, not altogether because they thrive better in such situations than the latter, but also because their habit of growth is more in harmony with the rugged and broken nature of the ground. Variety in the landscape in such cases is afforded by the conformation of the ground rather than by the stems and foliage, and that sameness of habit which characterises trees of this class is less noticeable. On flat or merely undulating ground it is otherwise, for here nothing

occurs to attract the attention except the vegetation itself. In such cases, broad-leaved trees usually produce a more satisfactory effect than Conifers, owing to the greater variation in the individual habits of the trees. In deciduous woods, again, we get the varying effects of spring, summer, autumn, and winter, the three former of which undoubtedly possess greater attractions for the ordinary observer than the little varied appearance which Conifers retain throughout the year. Generally speaking, therefore, the choice of species for a mixed plantation should be determined a great deal by the characteristic soil, situation, and physical features of the district. Whatever species thrive naturally in the locality should be planted most extensively, not as a regular mixture, but in masses or groups, in those spots which show them off to best advantage, and where slight differences in the character of the soil render one more likely to succeed than another. Distinct types should only be introduced where changes in the conformation of the ground lend themselves to their use, and where the reason for the change of crop is easily apparent. On flat ground, where no such alteration occurs, the necessary amount of variety may be afforded by placing clumps of another type here and there throughout the bulk in the shape of a mixture with the prevailing species, and in such a way that the change in the class of tree is of a gradual and scarcely perceptible kind, for abrupt changes are seldom natural. *A. C. Forbes.*

(To be continued.)

AN EXTRAORDINARY HYBRID (?) FERN.

Mr. E. J. Lowe has kindly sent me recently a frond and photographs of a presumed cross between *Asplenium trichomanes* and *Athyrium filix-foemina*, and unlikely as such an alliance appears, I am strongly inclined to believe it has taken place, since the bi-pinnate character of the *Athyrium* appears too distinctly, and is so alien to any sports of *A. trichomanes* as to be an extremely unlikely occurrence without foreign influence. I say this, despite my knowledge of the wide variation which undoubtedly occurs without any crossing whatever, because, wide as such variations may be, they are usually simple extensions, so to speak, of previous peculiarities, a plumose form becoming more finely cut, or a crested one more heavily crested. Cresting, *per se*, originates, it is true, in seedlings from non-crested forms, and so constitutes an exception to the rule; but I know of no case where a merely pinnate frond, as in *Asp. trichomanes*, sports into not merely a bi-pinnate one, but in this bi-pinnate form characterised by wide intervals between the pinnules. Thus *Polypodium vulgare* and *Blechnum spicant* both assume bi-pinnate forms, graduating from simple serration to such deeply incised pinnæ as to render them bi-pinnate, but no definite interval is developed, as in the case before us. On the other hand, on examining the frond itself, I find it to be *Asplenium trichomanes* in every respect but form. It is profusely sporiferous, the sori being densely confluent all over it, and the spores are apparently perfect, and display that ovoid shape with an irregular marginal ridge, which distinguishes the spores of this species most unmistakably from the smooth reniform ones of *Athyrium*. Among these I was surprised to find prothalli developed in abundance, germination being clearly visible in seven or eight days after sowing on July 10, and at present a crowd of healthy prothalli are jostling one another for space. I am sanguine, therefore, that a crop of sporplings will result, and yield by their appearance and development some clue to their true parentage. The fact that *Athyrium* is classed with the *Aspleniums* by the best authorities would seem to reduce the improbability of such a cross as this; but apart from a very meagre resemblance in the fructification which has led to such classification, there is absolutely no feature pointing to kinship, and no observant cultivator of varieties

would, except in deference to text-books, accept it as correct. *Athyrium filix-femina* is a large-growing deciduous Fern, of succulent, soft texture; a ground plant, affecting marsh and even boggy situations; is extremely prone to vary—more so, probably, than any other known species, and by virtue of this, has produced a great number of heavily tasselled forms, one even cresting to the fourth degree—i.e. frond, pinna, pinnules, and pinulets; the sorus is almost punctiform, with a ragged, horse-shoe-shaped indusium; and the spore, as we have seen, is smooth, and kidney-shaped. *Asplenium trichomanes*, and most of its allied species, are not deciduous, but evergreen; not succulent and soft, but hard and leathery, and they affect walls, rocks, and comparatively dry habitats. Then, too, they are little given to variation, though *A. trichomanes* is an exception, and even this, like all of its kin, fails to produce regular secondary crests; the sorus is usually long and lineal, and the spore is provided with a marginal ridge of a very pronounced character. In my opinion, therefore, this co-classification is purely arbitrary. With these facts in my mind, coupled with the great fertility of the plant in question, I hesitate until further evidence is provided by the rising generation now under culture to accept the Fern as an indubitable hybrid, though, as I have said, it is difficult to account for the form of the frond on any other hypothesis. In any case, the variation is so remarkable that I have thought a note there anent would be welcome. *Chas. T. Drury, F.L.S.*

VARIORUM.

CRANBERRY-PICKING IN WISCONSIN.—The army of pickers that descends upon the Cranberry-bogs of Wisconsin every autumn, is composed chiefly of Poles, Indians, and half-breeds, the Indians being considered the best pickers because they never strike, and always accept the prices offered by the overseers. As a rule, they earn a dollar a day and their board. They bring their lodges and tepees with them, and camp on the field. The Indians will not begin to work until half-past nine in the forenoon, and they promptly knock off at four in the afternoon, in spite of persuasions or threats. This peculiarity sometimes proves costly to the growers, for if a killing frost is threatened in the night, the owners are compelled to hurry about, and hire more white pickers, since it is a waste of time to try to get an extra hour's work out of an Indian. He would see the whole field frozen stiff first. At such times, the Poles realise the advantage of the situation, and demand extra wages for overwork. The Indians are good weather-prophets, and serve a useful purpose in foretelling when to prepare for frost, and when the word issues from the lodge of a chief that frost is approaching, the bogs are immediately flooded, and extra help is employed. If the water covers all the berries in time, no damage happens, but those that are left exposed will be ruined. *Garden and Forest.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By F. HARRIS, Gardener, Eastnor Castle, Leicestershire.

Cucumbers.—Where a continuous supply has to be furnished throughout the winter, an early start should be made, and if my previous notes have been followed, the young plants from which the fruits will be obtained should now be making rapid progress. Close attention must be given to tying and stopping, tying the shoots thinly over the trellis, in order to cover it with sturdy bine and healthy foliage whilst the weather is favourable. The fruits for the present should be removed. As soon as the roots emerge through the small mounds on which the plants stand, spread a little new soil, consisting of good loam in a rough state, which has first been made warm, over the surface. Should the house not have been at liberty earlier, plants if strong may yet be planted, and, given favourable weather, they will become well established before the winter sets in. See that the house is quite clean before planting out the Cucum-

bers, otherwise red-spider, mildew, &c., may soon put in an appearance. Should aphids appear, use the XL-All liquid. Old Cucumber plants, if still in bearing, should be treated as I have previously advised, and every means taken to keep them in health till as late a period as possible, and in that way spare the young plants. Keep the points pinched, spent foliage and deformed fruit removed, and the trellis covered with bine, affording nutriment in the form of warm liquid-manure once or twice a week. Do not allow the fruits to attain to their fullest size, but remove them when they are just fit for use.

Melons.—Plants with ripening fruit should be kept quite dry at the roots, and not be syringed overhead; during weather like the present, airing the pit or house freely on fine days, and affording fireheat so as to develop the flavour; taking care however that the sun does not shine directly on to the fruit, or it will turn the flesh of a brown colour. The latest crop must be pushed along speedily by utilising the sun's warmth, which is best done by allowing the heat inside the house to rise to 80° before giving air, and closing early in the afternoon, making use of fireheat on dull days and cold nights, as once a Melon plant is checked the swelling of the fruits is not readily set agoing. Frequently pinch the lateral shoots; afford a light syringing at closing time on days that are fine and sunny, and do not let the temperature at night fall below 70°; and in all other respects follow the directions given above. Always use water that is warmed up to 90°, and do not wet the stems of the plants.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Biford, Dorset.

Deciduous Calanthes.—Plants of *C. Veitchi* and *C. vestita* have commenced to show their flower-spikes from the base of the new bulbs, and it is important that each plant be given additional space. As soon as each batch of the deciduous *Dendrobiums* are removed to their resting-quarters, I fill the space thus vacant with the largest and most forward of the *Calanthes*. Every plant should be placed in a position where it will obtain a certain amount of sunlight. If the plants can be put within a foot of the roof-glass, the extra light will invigorate and solidify the bulbs, and counteract spot in the leaves. If stage accommodation be limited, the smaller plants may be stood singly in shallow pans or baskets, and suspended close up to the roof. During the middle of the day, when the sun is bright, a very thin shade may be necessary. By the end of this month the plants will have become accustomed to the extra light, and the shading may be dispensed with. The bulbs, though considerably advanced, still require plenty of water at the root, and in the extra sunlight the surface of the soil will dry quickly, and will require water accordingly. An alternate watering with weak liquid cow-manure will be beneficial to the plants, if it be discontinued when the plants begin to change colour. *Calanthes* of the *Reginieri* section are now in full growth, and as these would be injured by the extra amount of sunlight, they should be given a separate position, and treated as recommended for the others when they were in full growth.

Cattleya-house.—*Pleione concolor*, *P. lagenaria*, *P. Wallichiana*, *P. maculata*, *P. praeox*, and *P. Reichenbachiana* now require plenty of light and air. It is not necessary to dry-off these Indian *Crocuses* after their bulbs are made up, with the object of inducing them to flower freely; no difficulty being experienced in getting them to produce an abundance of bloom if the compost be kept merely moist until the flowers expand, when dryness at the root is necessary to prevent the flowers from becoming spotted.

Repotting and Surfacing of Odontoglossums.—As with *Masdevallias*, the most suitable time for repotting or top-dressing these plants is the present month, new roots and growths being now in course of development. The outer air is genial in this month, rendering it easy to afford a suitable temperature to the plants, which should be cool and moist, then re-establishment soon takes place. Before the plants are repotted, &c., search the young growths for yellow thrips, which are apt to escape notice owing to their minuteness, till some disfigurement of the leaves occurs. If any signs of this pest are visible in the interior of the growths, every plant should be vapoured once or twice with the XL-All liquid, doing this after sunset, first taking the precaution to moisten the paths, floor, and stages, and to maintain a moderate degree of warmth, which will have the effect of enticing the thrips out of their haunts on to the leaves, where the vapour soonest kills them.

It is always preferable to vaporise the plants before repotting them. Where a considerable collection of species and varieties of *Odontoglossums* is grown, some plants will not have commenced to grow at this date, and others are only just on the move, the repotting of both of which had better wait till further progress is made.

Odontoglossums which may be Repotted, &c.—The species *O. triumphans*, *O. Halli*, *O. Harryanum*, *O. luteo-purpureum*, *O. byatrix*, *O. polyanthum*, *O. tripudians*, *O. cirrhosum*, *O. cuspidatum*, *O. Nevadaense*, *O. naevium*, *O. Pescatorei*, *O. gloriosum*, *O. radiatum*, *O. mulus*, *O. odoratum*, *O. ramosissimum*, *O. Edouardi*, *O. sceptrum*, *O. cristatum*, the numerous forms of *O. crispum*, and the various hybrids of *O. excellens*, *O. Willekeanum*, *O. Andersonianum*, *O. Ruckerianum*, and *O. hebraicum*, which flowered early in the year, may be repotted during this month. A suitable kind of compost for them consists of living sphagnum-moss, good fibry peat in equal proportions, and a moderate number of small clean crocks. Let the sphagnum be well cleaned of leaves and rubbish, and slugs and snails, the last two causing the Orchid cultivator much trouble, as they increase very fast, and commit havoc among the plants. Should the sphagnum contain much water, first squeeze it well, then spread it out in the sun to dry. As regards the peat, it should have the fine dust sifted out of it. To enable the operator to mix the peat and moss intimately, a heap of each should be placed on the bench, and a handful of peat should be taken in one hand, and one of moss in the other, pulling the materials to pieces, so as to well incorporate them. The fresh pots should be quite clean inside and out, and proportionate to the size of the plants, the overpotting of any plant being carefully avoided. The pots should contain crocks to three-fourths of their depth, and above these a thin layer of sphagnum-moss. I may mention that last year I experimented with about twenty plants, and instead of putting in crocks I employed the rhizomes of Ferns which the peat contained, and up to the present time the state of the plants so treated has been satisfactory. Masses of Oak-leaves taken from the leaf-heap and placed edgewise at the bottom of the pot form a satisfactory kind of drainage material. This year many of our *Odontoglossums* will be treated in this manner. When the old compost has become decayed it should be shaken off the roots, but compost in a fairly good condition should only have the surface renewed, the roots being left undisturbed. In potting, the compost should be pressed together with a moderate degree of solidity, but not so much so that water cannot pass away freely. Keep the bottom of the plant somewhat higher than the rim of the pot, and when the filling-in is finished, a few heads of sphagnum-moss may be pricked into the surface. Plants in poor condition should have all of the stale compost removed, decayed roots cut off, and the entire plant be washed in warm water. After repotting them in as small-sized pots as possible, afford water plentifully once, and only just as much as will keep the sphagnum-moss alive; but use the syringe between the pots every morning; and admit plenty of air when the weather is favourable; and every day, just before sunset, close the upper ventilators, and well damp-down. This will cause the roof-glass to be covered with condensed moisture, and set up conditions favourable to the growth of the plants. In the course of the evening, and especially if the outer air is warm and moist, the ventilators that were closed at sunset may be opened to their full extent, and the last thing at night lowered again, but not closed, as much air being allowed to enter the house as is safe.

THE FLOWER GARDEN.

By CHARLES HERRIN, Gardener, Droghda, Maidenhead.

Herbaceous Borders.—The rains which have fallen during the past week have moistened the soil thoroughly, but they have spoiled many of the flowers, and rendered much tidying-up necessary. The stakes placed to all annual and perennial Sunflowers will have to be made secure, and *Michaelmas* Daisies, now growing very fast, should be given another tie to prevent their being blown about and made untidy. These plants promise to make a good display; plants of the dwarf and very useful variety, *A. Anellus* bes-arations, being already a sheet of purplish-blue flowers. *Phloxes*—which have been benefited by the rain—should be tied up loosely, if their height be above 3 feet. *Physalis capensis* is one of the brightest dwarf subjects in the borders at the present time, and although not frequently seen in gardens, it is a very desirable plant.

flower-stalks of Lavender should now be cut and laid out to dry in a warm room; while Helichrysms and other everlasting should be cut directly the flowers open, and hung up flowers downwards, in an airy house or shed.

Cuscuta corymbosa.—This half-hardy evergreen plant is admirably adapted for summer-bedding. In gardens where flowering-plants, such as Fuchsias and similar subjects are appreciated in the summer-bedding arrangements, this free-growing, yellow-flowered plant should always be included. It has the merit of continuing in bloom till checked by frost, although not hurt by a few degrees of frost. It may be carefully lifted and potted-up, when it will continue to flower in the greenhouse or conservatory to the end of the year, at which time water should be partially withheld, so as to induce a state of rest, but being an evergreen, it must not be kept very dry, or the leaves will drop off. The flowers are but little affected by damp.

Tuberous-rooted Begonias grow and flower freely in wet weather; and, although seeds form a certain way of increasing the stock of these plants, cuttings are the quickest and most trustworthy method of obtaining plants of any desired tints. These will strike easily now if made from the short side-growths, which are of a harder nature than the strong points, which being very succulent, are liable to decay. Having made the cuttings, place them to the number of four round the sides of a well-drained 64-pot, filled with light sandy soil. If the pots be plunged in a mild hot-bed, roots will form in the course of a few weeks. Pot-off the cuttings as soon as they have plenty of roots, and keep them growing in an intermediate-house throughout the winter and spring. If bushy plants are desired, the points of the shoots should be nipped off in the early stages. Standards are easily formed by taking up one strong shoot, and stopping it at the required height.

THE KITCHEN GARDEN.

By W. POKK, Gardener, Highclere Castle, Newbury.

Vegetable Marrows and Ridge Cucumbers.—Cut the fruits for table use when of small size, and do not allow any to grow large and develop seeds unless a large number of plants exist, as seed-bearing checks the production of fruits. As the nights grow longer and colder, it will be advisable to cover the Ridge Cucumbers with spare lights, and thus prolong the season of fruiting by several weeks. Give abundance of water to both when required, and, occasionally, weak liquid-manure.
